| Socio-economic | Financial challenges |
| Spiritual | Physiological challenges |
| Domestic | Work related challenges |
| | Restraint on social life |

## Women Caregivers Roles

The results of the study elicited at first hand from respondents underscored that caregiving especially to older people is not only an arduous task, but also enervating and quite time consuming as a full-time work. In the views of participants, the only thing that drives and motivates commitment to caregiving is the bond between caregivers and the recipients of the assistance. This suggests that the various forms of services (broadly ranging from socio-economic to spiritual and domestic), unremittingly provided by caregivers, are driven by social ties. The findings are thematically discussed below.

### Socio-Economic Roles

Our interaction with participants revealed that, as part of a broader scope of task, caregivers provided socio-economic assistance to their respective older people service-recipients. In addition to working to help provide for the various basic

needs of service recipients, the study further revealed that participants either directly fulfill social roles and responsibilities of their indisposed relations or indirectly provided assistance towards the fulfillment of such obligations. On the economic front, a handful of participants of unemployed participants revealed that even though their caregiving duties rarely permits them to work regularly, there are times situations and the need of their relations compel them to undertake part-time laborious jobs with building construction establishments so as to gather some peanuts to anchor their survival. In our interactions, some participants recounted the following:

> *Mostly on Fridays, he cannot go to masjid (mosque) for Jummah prayers, so I go with him and come back home with him too. He is my father, so it is my duty to assist him do everything*

> *You know he cannot see now. So, he virtually cannot do anything. I have to do everything now. I have records of days he is supposed to visit the hospital for regular checkups, so when the time is due, I assist and go with him. I love him so much, and cannot abandon him at this hour. It is my responsibility. I think this is my jihad.*

*Others said that;*

> *Because of his ailment, I cannot take up any work. Have stopped working now. Assisting my husband is now my full-time work. I could have taken up full time work to help support the family in hard times like this critical moment. I could have worked. I have actually had several opportunities, but for his unwellness, would have to let go*

> *Because of his immobility, I have to do a whole lot of things like taking her to the herbalist, represent her at ceremonies like funerals and weddings. I am close to him, and we have been together for quite some time now so I understand him. I serve him wholeheartedly and I love him as my step father*

## Spiritual

Relative to the spiritual roles dispensed by caregivers, our interaction revealed a two-fold role. On one breadth, caregivers professed to be spiritually interceding and intervening on behalf of their relations for healing and protection. On another breadth, caregivers indicated how they aided relatives to fulfill some religious and spiritual obligations. This from our interaction appeared to be borne out of the conviction that ill-wishers and bad forces could potentially work to induce ill health situations. For this and other reasons, participants believe that seeking for treatment does not only always require clinical measures, but also some form of spiritual assistance. In interacting with participants, some said that;

> *Sometimes I go to mosque and pray for him. Allah has the power to heal all forms of infirmities. So, I think I should cast all my burdens on Allah. I believe in him. And I know one day, Allah would have mercy on her*

> *I have asked for the help of my imams to help me with prayers so that my husband will be well. He is a committed Muslim. Now because of his ill health, he cannot do anything. I have asked friends and families to also help us with prayers as well. I know Allah is most merciful. That is why he called Al-Rahman. He will heal him one day. I know, and I am sure*

## Domestic

Further interaction with participants indicated that participants felt they have it as a responsibility to provide some form of care or the other to their older family relations. Even though it was obvious that caregiving was an energy-sapping work, majority of participants were generally of the notion that no matter how challenging or difficult it is, they still consider it worthy to assist their older relatives. This in the views of participants constitutes the push factor in extending help to relatives. Moreover, the reason that family relations are supposed to be supporting elements for each other has been a factor that sustains the assistance caregivers provide. The urge to serve in the views of most participants could be ascribed to the communal bonding tendencies that the traditions and cultures of the Somali society imbibe in its members. Some participants expressed the following;

> *It is part of our culture to care for one another. We cannot leave her to her fate. That is not the culture of Somalia. It is not the culture of any clan in this country. We believe in social bonding. And we believe that, this holds the fabric of our society together*

Another reiterated that;

> *It is the responsibility of our society to care for each other. A problem for one person is generally a*

*problem for the entire society. So, in hard times, we come together and help. It is the same strength we gather and deploy in caring for the aged. The aged are source of blessings for the society. If one takes good care of the aged, he or she gets blessings. And the blessings run throughout our lives whenever given by the aged. It is actually a source of pride to have an aged person in the family. A household with an aged person is a house with pride.*

## Women Caregivers Challenges

As much as participants evinced an unwavering desire to assist the older people in their respective societies and homes, it was apparent through our interaction with participants that not all has been easy-going. Among some of the challenges recounted include financial, physiological, and work-related challenges. In addition, restraint on social life appeared as another challenge saddling caregivers.

### Financial

One key challenge of caregivers that appeared generally repetitive in our interaction with respondents bordered much on financial difficulties brought about by caregiving duties. In the views of caregivers, this situation has further been compounded by the time-consuming nature of assignments, which has over time prevented them from working or getting themselves engaged in any economically productive venture. And because this has been the case, most participants are of the opinion that contributions to caregiving cannot be complete without a sufficient financial wherewithal to complement such efforts. In view of this, some participants narrated the following;

*Caregiving is a very tough job which requires a substantial amount of money. For instance, paying for health and buying medications, transportation to and from hospital all requires money. How does one meet these challenges without work?*

*Now, I cannot work. My father is sick, and he is not working too. Family members are not helping enough. How then do we cope with the financial situation now? Our hope now is now on Allah. He is the only savior we are looking up to.*

Another said that:

*Caregiving takes much time. I cannot work because I need to find more time and take care of my wife. I cannot purchase prescribed quality medications because I have no money. I am not working. There are times I reach out to the herbalist to for some herbs as alternative medication. I doubt the efficacy of these medications though, but as a result of financial difficulties, I have no option*

### Physiological

Participants' interaction revealed caregiving as daunting. It also became obvious that caregiving obligations came with some form of negative impacts on the wellbeing of caregivers. By physiological wellbeing, participants referred to physical and social wellness, as captured in their overall healthiness. Recounting on the negative impacts of caregiving such as inducing stress, tiredness, among others, some participant said that:

*Caring for her brings pains all over the body. As we talk now, I feel pains in my body. My joints are all feeling pains and weakness, all because moving her in the wheel chair from one place to another in the morning, and then to another place in the evening requires lots of energy. She has now put on much weight because of always sitting at one place. And this is making it difficult to manage her*

Other had the following to narrate:

*I think I am frail now. I feel sick than her now. Her situation is not the best. It is not seeing any improvement. It is rather deteriorating. And it is quite worrying. Owing to caregiving, I can notice a big change in my health situation now*

*Combining childcare with older person caregiving is very difficult. I have had to combine the two, on top of performing some household chores. It is not easy my brothers*

### Work-Related Challenges

Participants shed substantial light on how caregiving has affected working engagements, and by extension, their financial soundness. Most of them expressed the difficulty to combine work with caregiving roles. Under this situation, participants have given up employment to fully concentrate on caregiving roles. Some participants expressed the following:

*Until my aunty is well, let me say, I have given up my working capabilities. I cannot work. She needs time. I have to spend much time with her. When am with her, she feels lively*

*To have time for my ailing wife, I resigned from my work. I cannot be chasing money when she's is sick. I have to care for her*

### Restriction on Social Life

Caregiving roles, to an appreciable extent, were revealed to place restriction on the social life of participants. According to participants, the generally delicate situation of the cared makes it difficult if not impossible to leave them alone. This is because their situation requires frequent monitoring. Others also expressed that the seeming general immobility of care recipients requires caregivers to constantly be in their company. For this reason, most participants have been unable to participate in social activities. Sharing perspectives brought about the following comments:

*Quite unusual of me, I now don't have the freedom to part take in social activities. Life has been boring. Because of caring for my mum, I don't have social life*

*I can no longer meet my friends to converse as I used to do some years back*

*For some time now, I have not been attending "guur" (marriage) or "duug" (funeral). I feel bad. These are social obligations we are all expected to meet, but now, I cannot*

Not only were caregiving roles restricting individual in their social life. It apparently became evident throughout our interaction that the roles were affecting marriage lives of caregivers. Most participants complained of unhappiness (precipitated by the new roles) in their marital homes. Whereas others also bitterly complained of the unhappiness and disaffection that has come between them as parents and their wives and children, some also confessed of their irresponsibility towards their family. This is because their obligations are torn between their nuclear families and care recipients. This is an ample proof that caregiving roles could come with uncertainties as grave as ones with the potential to break homes. Some participants tearily said the following:

*My children complain of late. They think I do not care for the family. They also think I am irresponsible because I am unable to send them much money. But it is not my fault. My mother is not feeling well. I am the youngest among her children. The others are not around. And I have taken up the responsibility to care for her*

*My marriage is now on the verge of breakup. My husband thinks I do not have time for him and the family. Even though I visit him and the children in Mogadishu monthly, he thinks that is not enough. He once told me this is not the kind of marriage he envisaged. He recently called for divorce. It took the intervention of some community elders and some family member to change his mind. Even with that, he still calls for it any time he calls me on phone. My aged father is not happy with the state of affairs because he thinks, his care is causing these problems. But there is nothing I can do. Whatever happens, I give it to Allah*

Another woman stated that:

*My husband think I am selfish. He thinks I think more about my extended family that my nuclear family. I have pleaded with him countless occasions to be patient with me, but he would not accept any. He always tells me to marry my mum. Now he is fed up with me. But I understand him. He is right anyway*

## Discussion and Implication

Healthcare and service delivery has undergone a phenomenal transition from a hitherto purely and largely practitioner-centered to one complemented by caregivers' service. In essence, the step-in role caregivers play in support of health service delivery significantly asserts their indispensable role. This study employs a qualitative study approach to investigate roles of caregivers and the challenges they encounter in the exercise of their duties. Study participants were selected from two rural and urban areas each in Somalia. The study contributes to literature by providing evidence of empirical value to the subject matter of caregivers. The study makes interesting and significant findings with essential policy implications.

Firstly, the study results confirmed the varying significant caregivers' roles spanning from socio-economic, spiritual, and domestic. These findings are echoed by Sinha (2013), Steiner (2015),

Sharma et al. (2016). Moreover, study further revealed several challenges encountered by caregivers. The findings pointed out that though caregivers were resolute in assisting the aged, they however generally appeared gravely challenged. In view of this, what however sustained the efforts was an unbridled sense of social and customary obligation to provide such services to the aged in the society. Notable among some of the challenges identified bordered on financial, physiological, and work-related ones. Participants also cited the limitation imposed on their social lives as a huge difficulty for them. These findings are in consonance with (McGhan et al. 2013; Sharma et al. 2016). The combined effects of these challenges have constrained caregiving efforts and services rendered. Therefore, injecting some appreciable dosage of effectiveness and efficiency in the works of informal caregivers calls for concerted efforts by health sector stakeholders and the general society, to support their initiatives and services.

This study has implications for policy, practice, and further research. The study findings have relevant bearings on social policy, more particularly to improving the conditions of caregivers and service recipients through an efficient and effective stakeholder-driven policy design/formulation and implementation. As sustainable development goals are driven and debated, precisely Goal 3, which enjoins polities to *"ensure healthy lives and promote wellbeing for all at all ages"* an empirical investigation of informal caregivers in a country like Somalia which just emerged from the throes of a protracted civil war would be an excellent and unique contribution to detailing the possible and plausible paths to chart.

Our findings indicate that as much as caregivers play essential roles in the society, they undergo series of challenges on daily basis. This requires critical and holistic review to provide support for their indispensable efforts. Against this backdrop, health sector stakeholders must demonstrate some degree of commitment towards advancing some forms of aids to caregivers and care recipients. The way forward in this regard could be through the inception of cash and kind supporting schemes that would guarantee access to health care and other forms of social services. Specifically, stakeholder should push for the institution of a government-based National health insurance scheme in Somalia.

Moreover, government actors, in concert with nongovernmental organizations, should make efforts towards either providing some kind of medical subsistence to individuals and households with aged people, particularly, those indisposed or health-challenged. This would go a long way to relieve caregivers of financial obligations. Also, given the informal services that caregivers provide, health sector stakeholders should educate caregivers on basic ways to handle certain delicate situations of older people. This would further help avoid complications brought about by poor handling.

## Conclusion and Limitations

As a seminal study investigating not only the roles but also challenges saddling informal women caregivers in Somalia, the authors are convinced that this study would make insightful contributions to laying the foundation to spur future studies in informal caregiving while at the same time empirically providing evidence to that effect. Moreover, this could provide sufficient policy basis and pointers to government, nongovernment actors, and other stakeholders in and outside Somalia as well as in other developing countries. In addition, gathering varying views from both urban and rural denizens providing caregiving services help present diversified views integrated into a holistic perspective. Hence, this study will help to bring into the limelight some hurdles confronting their service delivery. This would draw attention to addressing some of these gaps. Given the confounding confluence of perspectives shared by participants, the authors recommend that initiatives undertaken to support informal caregiving should take into consideration, recommendations proffered by this study, to facilitate policy design and implementation. As much as the research strengths have been highlighted, it is instructive to state the research limitations. The limitation of the study to the four study areas, thus, Bacaadweyn, Daarsalaam, Garoowe and Baladweyne, and the use of a relatively smaller

sample size limit its generalizability. Future studies should focus on increasing the sample size and expanding the scope of the study settings to undertake a large-scale study. Nonetheless, these do not in any way impair the validity and reliability of the study findings.

## Synonyms

Caregiving; Informal care service; Somalia; Women caregivers

## Definition

Caregiving is conceptualized as the various forms of social, economic, emotional, physiological,

and psychological services administered to vulnerable groups including the aged.

## Introduction

Global evidence presented by the National Alliance for Caregiving and American Association of Retired Persons (2009) indicated that about three-fifth of indisposed older adults are cared for by family members. The national alliance for caregiving (2009) stressed that approximately a population of 16 million made up of relations provide long hours unpaid service to relatives suffering from chronic ailments. This indicates that informal health care constitutes an important component of the global health system. It has become an intrinsic and extricable part of the modern health-care system across countries belonging to either developed or developing world (Nordmeyer 2002; Agyemang-Duah et al. 2019). The impact and the general pertinence of the services rendered by informal caregivers become much crucial in a developing country like Somalia.

Given the resource constraints and the general low living standards prevailing in developing countries, the relative service availability, ease of access, and affordability of caregivers' services signify the relevance of informal caregiving (Sudhinaraset et al. 2013). The practices of informal caregivers of older people in Somalia are not formally regulated. Therefore, older people may not receive adequate care and attention. Although informal caregivers in Somalia have a key role to play (Arkorful et al. 2020), especially in providing care support for older people, there is little understanding about how they are able to cope with the challenges coming from their responsibilities. Thus, this study explores the experiences of women caregivers in Somalia with the aim to offer suggestions to informal caregivers on how to manage or overcome challenges from the caregiving.

The expected increased population of older persons to double and reach 2.1 billion by 2050 further highlights the relevance of caregiving (United Nations 2017). Also, emerging societies are expected to be host to the world's older population (United Nations 2017). He and McHenry (2016) also project a rise in population of people older than 60 years from 46 million in 2015 to 161 million by 2050 in sub-Saharan Africa. This is a sufficient proof that developing counties, especially Africa, would bear the full brunt of an increased population of older people in future. More particularly, Somalia will not be left out of the inconvenience and discomfort that will be generated by this phenomenon. This presents quite a precarious situation with many implications for overall human development, especially, health-related components of the sustainable development goals.

According to UNFPA (2014), Somalia has a youthful population growing at a rate of 2.8%, with 45.6% of the population below 15 years. Also, 52.3% of the population are between 15 and 64 years. The population of those above 65 years represent 2%. Though this may represent an insignificant population at the moment, against the backdrop of the population growth rate of 2.8% and the general anecdotal evidence of hardships and low standards of living among older people, as evidenced in social discourses in Somalia, there is a cause for grave for the future of the older people in a country that still subsists on donor support.

In spite of the increasing research focus on informal caregiving of older people in other countries (Haley et al. 2004; Proulx and Snyder 2009; Branscum 2010), to the best of the knowledge of the authors, caregiving in Somalia is virtually an unexplored area. The status of the country as undergoing infrastructural reconstructions and institutional restructurings from the decades of civil rift however makes the situation understandable. Given the deficit in this area of studies, this study sets out to open up a new field of research study by exploring how informal caregivers in urban (Garoowe and Baladweyne) and rural (Bacaadweyn and Daarsalaam) Somalia devise strategies to cope with caregiving hurdles.

### Informal Care in the Somali Context

The upsurge in the population of the aged people worldwide has resultantly brought about a

corresponding increase in health care and social systems (Wimo et al. 2006). As ageing has been linked to deteriorating physical and mental health conditions, older people are likely to require care support from family members and friends in performing daily activities and managing tasks (Kneebone and Martin 2003; Zarit and Zarit 2011). Informal care has become a central component of the culture of societies, especially those in the developing countries (Agyemang-Duah et al. 2019). Essentially, the family has not only become a backbone, but also a shock absorber that absorbs incidence of uncertainties like ailments and old age. In the case of Somalia, caregiving is hinged on customs, predicated on the concept of communalism. By this, members of the society feel a sense of collective obligation to provide help for each other. This same consideration comes into play in providing care support services for older people and other vulnerable members of the society. However, studies related to caregiving have identified factors contributing to the waning of informal care, also referred to as family-based care. In a study in Ghana, Nortey et al. (2017) identified dwindling sense of care in social services in the twenty-first century. They ascribe the low patronage of informal caregiving to the combined effects of urbanization and modernization. Perhaps the degree or intensity of the decline in informal care in Ghana may not be similar as presently prevailing in Somalia. Moreover, the status of Somalia as a country that just emerged from the rubbles of a protracted civil war sharply sets it in contrast with Ghana. This notwithstanding, a careful observation and assessment of the society reveals that the onset of the debilitating effects of urbanization, modernization, and globalization is also rearing its ugly head in the social structure of Somalia. The emergence of this unfortunate phenomena is gradually taking a toll on caregiving support for older people. Because this has been the case, the research assumes that, investigating into existing support systems, formal or informal, deployed to assist older people could be germane for planning and policymaking efforts towards either alleviating or ameliorating the deadweight effects of caregiving of older people.

## Informal Caregivers' Challenges and Coping Strategies

The conditions of caregivers and their respective challenges are not static. Caregivers are overwhelmed with challenges ranging from financial, emotional trauma, restraint on social life, and the limited ability to engage in economic activities, among others (Arkorful et al. 2020; Agyemang-Duah et al. 2019). Essentially, caregivers' conditions and hurdles vary with respect to socio-demographic factors like gender, environment, availability of resources, ethnicity, conditions of care recipients, and perhaps the level of education of caregivers. Whereas the conditions of females may differ from that of their male counterparts (Wade et al. 2001), the conditions of caregivers in rural and urban stings may also sharply contrast with each other (Agyemang-Duah et al. 2019).

Moreover, resourcefulness, precisely concerning needs and information on caregiving, may results in variations of caregivers' conditions (McGhan et al. 2013). The conditions of caregivers and how this may bring about variations in caregiving is significantly confirmed by King et al. (2010). Branscum (2010) confirms the issue of ethnicity and its changing effects on caregiving. In his view, an increase in elderly population predicts a change in demographic profiles of populations and subpopulations (Koerner and Kenyon 2007; Ekwall and Hallberg 2007). Against the variations in conditions, caregivers undergo series of challenges. And in the face of these challenges, caregivers have different ways of responding to and addressing these challenges, as when they set in. Caregivers coping mechanisms consist of a wide range of complex and dynamic set of cognitive, affective, and behavioral responses targeted at regulating emotions, providing antidote to problems, maintain psychological resistance, and develop strengths required for caregiving (Gottlieb and Wolfe 2002). For the purposes of this study, coping is conceptualized as the range of options employed by caregivers to overcome caregiving hurdles. Among some of the key drivers of caregiving may include some forms of social and economic support from families and friends (Nortey et al. 2017). The efficacy of

these forms of support to caregiving is confirmed by Wade et al. (2001). In addition to receiving social support from friends, families, and well wishers, the study equally confirms how caregivers dispose of assets to raise funds for caregiving. Within the context of Somalia, to the best of the authors knowledge, there is a dearth of research not only about caregivers, but also on coping strategies. As such, this seminal study would help lay the basis for future studies, while at the same time providing the impetus to pushing the frontiers of policymaking and implementation on caregiving in Somalia.

### Research Question

The main objective of this study was to explore the experiences of women caregivers of older people in coping with challenges coming from their caregiving to provide suggestions for caregivers in dealing with caregiving difficulties. This specific research question was explored:

What are the experiences of women caregivers of older people in Somalia about their coping strategies?

## Methods

### Study Design

The experiences of women caregivers providing care support for older people in Somalia were explored. Considering the exploratory nature of this study, the fact that it is the first empirical study on the topic in Somalia, a qualitative approach was adopted. The interpretive phenomenology was used to explore and analyze experiences from the caregivers. Phenomenology is used to study the lived experiences of research participants (Patton 2014). In particular, interpretive phenomenology argues that researchers' assumptions, beliefs, and presuppositions are used as a framework in analyzing and exploring participants' views (Shaw and Anderson 2018). Two of the authors are Somali born and have lived in both rural and urban areas of Somalia. Their live experience and knowledge of caregiving from the Somali context provided the researchers with useful information which influenced the designing of the interview guide, how interview questions were asked, what questions were included, and the data analysis process. Although the design of the study was influenced by the preconceptions of the researchers, measures were put in place that the findings presented reflected the experiences of the participants, not researchers. For example, the interview transcripts and codes that were developed during the coding process were shown to 11 research participants to ensure that themes that were created reflected their own words. Moreover, the authors who were not Somali born served to ensure that discussions coming from the data analysis were devoid of any preconceptions and only based on what the interview data revealed.

### Study Participants and Sample Procedure

The study sampled 40 participants from across the two randomly chosen rural and urban areas. For the purposes of representativeness, the study sampled ten participants each from the selected study areas. Given the general difficulty of identifying participants, the study employed a mixture of purposive and snowball sampling. In operationalizing this method in the respective study areas, in consonance with the recommendations of Rubin and Babbie (2016), the research team identified a first participant who afterwards led the research team to access other caregivers. This affirmed trust in the participants and further consolidated cooperation. On this basis, participants freely shared their views on the topic under investigation.

### Eligibility Criteria

In meeting the objectives of the study, certain criteria were set for the inclusion and exclusion of participants. Prior to inclusion, participants were supposed to be providing care service to persons above 60 years. Caregivers were also expected to have provided caregiving services for more than 5 years. And finally, participants were expected to be within the selected jurisdictions. On the other hand, participants were excluded on the basis that participant was providing caregiving services to people below 60 years. Besides, participants who have provided services for less than 5 years and living outside the selected areas were excluded.

### Data Collection Procedure

Prior to commencing interview sessions, participants who could read in English were given an information sheet clearly detailing in succinct terms, the nature and purpose of the study. Those who could not read on the other hand were given the opportunity to get a relative to assist. In instances where participants had no objection, the researchers explained the study purposes to the participants. After consenting to participate in the study, participants were told of their liberty to voluntarily opt out at any stage of the research interview. Given the sensitive nature of the issue under investigation, there was no instance when a participant either opted out or demonstrated the intent to opt out. They were further assured of the anonymity of their identity throughout this study. In eliciting data, the study used a semi-structured interview guide. Three research assistants were present throughout the entire session of the data collection period to clarify issues and respond to queries. The research assistants were well briefed on the study and the use of the instruments. With the approval of participants, interviews were recorded for about 30–60 min. Instruments employed included a tape recorder, a note book, and pen for writing. Interviews were carried out in Somali. Prior to data collection, the interview guide was pre-tested, later refined based on the suggestion of participants, and the final guide designed and submitted to experts for approval. The final interview guide was designed to help gather data on strategies devised by to overcome caregiving challenges.

## Data Analysis

Transcribed data were subsequently thematically analyzed in consistency with Braun and Clark (2006). Following the recommendations of Lacey and Luff (2001) and O′ Leary (2004), the research team read through the data, organized and coded data, searched for patterns and interrelationships, mapped and constructed themes, built thematic data, and subsequently drew conclusions. With the help of a coding system generated by the research team, with field notes as a complementary guide, transcriptions were analyzed. In enhancing data codding, memos were developed and research concepts labeled. These were done to achieve the overall objective of helping to identify coping mechanism of participants. As part of the process to present results from analyzed data, feedbacks of participants were presented as quotations to buttress expressed opinions.

## Results and Findings

### Sociodemographic Characteristics of Study Sample

The study sampled 40 women caregiver participants from across four randomly selected areas, evenly distributed across urban and rural spaces. Table 1 presents information on the sociodemographic characteristics of the study sample. From Table 1, it could be seen that most of the participants recruited for the study were above 50 years (47%). Married people also constituted 67% of the study. It is further apparent that women caregivers of older people who had served for a duration of 5–7 years made up the largest population 80%. Muslims also composed 95% of the study population, with an evenly distributed study population of 50% for urban and rural areas, respectively. Participants from the Darod clan were the largest population in this study, making up 82%. Moreover, 62% of the study population were unemployed. And finally, 73% of the study population had not received education (Table 2).

## Caregivers Coping Strategies

The research team's interactions with participants revealed a plethora of coping strategies adopted by caregivers to overcome challenges brought about by caregiving. Through our interactions, it became apparent that individual participants had devised several ways of coping with caregiving challenges. Key themes identified are thematically discussed below:

### Social Support from Well Wishers

Narratives gathered from most caregivers indicated that one of the ways of coping with

caregiving challenges was from social support drawn from and offered by the members of the society. In the views of participants, it was gathered that social support comprised of tangible and intangible elements, as well as physical and emotional factors. In discoursing on social support, participants clearly demonstrated their appreciation for the kind of warmth and comfort they derive from such gestures and how their caregiving activities have been sustained. Precisely, on this, some participants reiterated on the kind of cash and kind support they received from members of the society. Even though these forms of support according to participants are mostly inadequate, they however contributed to sustaining caregiving efforts. And this also motivated the delivery of caregiving services. In the views of participants, these forms of support provided some kind of relief to them as well. In recounting on benefits of social support, such as cash and kind ones, participants said that:

> There are times some visitors extend their benevolence to us. They give us money, clothing and other personal care things like pomade, soap, detergents and other things as well.

> When his other brothers and sisters are coming for visit, they buy a lot of things for us. They buy lots of things including foodstuffs for us.

On another breadth, some participants cited taking financial assistance from benevolent and charitable people including friends and family members within the society as one of the supports that enhances coping with caregiving difficulties. According to some participants, these forms of help are always difficult to come by. This in the views of most participants could be attributed to the general hardship within the society. In soliciting for financial assistance, participants indicated that whereas some people freely offered help, others offered financial aids in the form of loans which families and caregivers have to repay within a period of time agreed upon. Participants recounted the following experiences:

> I borrow money from people to be repaid within a reasonably short period of time. As unreasonable as the time of repayment is, i take it and without option accept and terms and conditions involved.

> Situation pushes me to take money from other people to solve some problems. I don't have money to help all the time. When I don't have, I take from people and repay later. Sometimes it even becomes a problem for me and my creditor.

A handful of participants also recounted that there are some few well-to-do people who sometimes add some form of small percentage to the money given to them as loan. This is the views of participants strained and stressed them during repayment. In raising concern about the situation, some participants said that:

> Though this is a Muslim society, some people give loans with "rbah" (profit). In principle, our religion is against interest, but some few people take it. I cannot say much about that. It is their money, and they decide what to do with it and how much to charge.

Moreover, interactions with participants revealed that though taking financial assistance from close and distant relatives was an alternative to coping with caregiving challenges, it came with strings of challenges especially in times of defaulting payment. On the difficulties brought about by this, some participants said that:

> At the moment, I am indebted to a lot of people. People don't trust me now. I cannot borrow from anyone again. I am now known all over the place as a debtor. I am virtually without integrity because of the huge debt I have on me. But I didn't spend the money on useless things. All went into my father's care.

> You know, it sometimes gets disgracing and discomforting, especially when the repayment time is due, but I don't have the money and the creditor is on me heaping pressure to pay. It sometimes makes me feel like committing suicide. But whenever I thought of that, I asked myself one question; who would care for my mother? With this, I drop the idea.

Despite the general consensus that caregiving is a backbreaking task, participants equally expressed the idea that part of what keeps them going is the consolatory messages they received from people they met, both in and outside their homes. In their views, these words rekindled their spirits and whips up their enthusiasm to work more. They also reiterated that sharing these words with the cared for equally made them lively. Other participants also demonstrated their appreciation for the words of encouragement drawn by other people from the holy book, Quran, to motivate them. Others also confirmed that they are encouraged by the stories of other caregivers and the experiences they go through recounted to them by their relations. On this subject matter, participants said that:

> Other people share some word of inspiration with us whenever they visit. Some use quranic quotations to inspire us. These words are pleasing for the ears and spirit, very comforting and healthy for the troubled soul.

Another said:

> There are times I go outside and coincidentally meet well-wishers who offer words of hope. Some of them go extra miles to share the experiences of others with me. I get hopeful with these kind words.

> There have been times I have felt empty. And in those times, people come in handy from nowhere to encourage me and the family. They sometimes tell us stories of others. And this encourages us and

> makes us feel, others are even going through heavy times. With this, we get some form of relief and hope for the better.

Going forward, as part of social support–based mechanisms to cope with caregiving difficulties, some participants indicated how communication with friends and families help in providing relief. Some participants stressed on how they engaged their relations through phone and personal conversations. This in the views of participants relieved them of burdensome thoughts. As much as communication provided a window for participants to freely allow stagnated feelings to flow out, it equally provided them opportunity to empty their emotions of stress and other burdens injected into them by caregiving assignments. Our interaction yielded the following response:

> When I feel bored or stressed, I talk to friends on phone. This momentarily provides me relief. I think it is better than nothing. At least for a while, I am able to feel well.

> Talking to people has been therapeutic. It heals me and makes me feel my normal self.

### Taking Intermittent Caregiving Breaks

Some caregivers emphasized on the stressful nature of caregiving. In the views of participants, moving care recipients from one to place to another, cooking for them, bathing them, and performing other domestic and social activities for them brings about bodily pains and other health challenges. Under such circumstances, participants buttressed the point that to save themselves from stress and burnouts associated with caregiving, they, in between times, take short breaks to relax, replenish lost energies, and come back to provide support thereafter. In this regard, a respondent said that:

> When I feel worn out, I take a break for 3–5 days to visit my family in Garowe. This is some form of relaxation I give to myself.

Another emphasized that staying home provided no relief. In the views of most participants, it rather compounded emotional challenges and contributed to further stressing their body. This they indicated as an ordeal that sometimes takes a toll on their health and their caregiving roles. Engaging participants on this elicited the response that:

> The home is no longer home. It is hell. It is very boring. This is very stressful. But whenever I felt this, I try to talk to people. This has been very helpful for me over the years. I entreated my neighbor caregiver to do same and she has confirmed its efficacy.

Another participant also said that:

> On some days, I feel burnout in my body. I feel much stress and pains. I wish I could explain the feelings in a much better way for you to understand. I think it is something that I only understand. You wouldn't understand if you are not in my shoes. In such moments, I try to take a walk in the community and get some few people to talk to. It makes me feel fine somehow.

Another stated that:

> This work is very difficult. The kind of stress I go through and the days I take to rest is not enough. Whenever I start feeling pains in my body, I sometimes rest to take relief for a maximum of 1 week. I join my family in the city.

### Taking Part-Time Assignments

Though caregiving is time consuming, some participants stressed that they were unable to fully engage themselves in economic activities that could guarantee them access to a sustainable source of income to complement caregiving. This however said, some participants conceded that in more difficult times, they were compelled to undertake some part-time menial jobs to raise some funds to cater for their relatives. In doing so, most participants indicated that they engaged in menial jobs such as providing labor for people and sometimes at construction sites to help them get the needed money to support themselves and their patients. Our interactions elicited the following responses:

> When things get difficult for me and there is no hope pf getting money to buy some things for her upkeep, I go out to work as a laborer to raise some money to get her the needed items.

Another said that:

> Caregiving is about time and money. It is not an easy adventure. Actually, it is very tough. I have been with him for some time now. He is my uncle. He raised me from childhood. So, I owe him care, more specially at this time. All responsibilities are now on me. To get money, I sometimes go to help people at their work place as a laborer to get money and help the situation.

### Belief in Allah

Caregiving support providers mostly exhibited an unwavering faith in the creator whom they mostly referred to as Allah. In their belief and conviction that Allah is Al-Rahman (most merciful), Al-Walee (protector) and the sustainer of all creations, they believed that laying all problems at his feet in prayers at all difficult times was the reasonable thing to do. Participants further indicated that though they sometimes get worried with the difficulties they go through with their service recipients, their belief in God allayed their fears and worries. The following captures the expressed sentiments of participants:

> As I talk with you now, my only hope is Allah. He is the only one I have built my hopes on. And nothing else. Allah been the one who knows the future should take control of the situation. It is all beyond me. I cannot carry these, allalone without him.

> I surely know a day is coming with smiles. That day, Allah would put smiles on our faces, and testimonies in our mouth to tell the world about his greatness. That day would soon come.

In what appeared to be a positive display of a resilient spirit, some participants indicated their preparedness to defy all odds and confront the tides that come their way, in so far as their caregiving duties were concerned. It became apparent that participants were resolute in their conviction and intention to serve their patients. Regardless of the words of discouragement hurled at them, they stressed on their readiness to counter and resist all forms of demotivation. From our interaction, it was obvious that source of strength of participants was deeply rooted in their belief in the almighty Allah. In this regard, a participant stressed that:

> Some people have said discouraging words to me. People believe that everything is impossible. They think it is too late, and all hope is gone for us. But I still have hope. Allah has a way of testing our iimaan (faith) and strengthening us. This s exactly what I think I am going through. With Allah, I shall overcome this.

> I know myself now. I have no helper. I have no relative to come to my aid. I am alone. In all these, I know I have Allah. I know the almighty Allah is with me. Insha Allah, everything shall be ok. Insha Allah. I trust Allah so much. I am a Muslim and Allah won't let me down in these trying moments. I know.

### Financial Discipline

Strict adherence to financial disciplinary measures was cited by most participants as a way to overcome coping challenges. According to participants, since they were not working, and as such unable to raise money, it helps to save them from needless expenditures. For this reason, there was the need to control expenditure. A participant said that:

> Now I cannot buy things as I used to do some years back. I am not working, yet with huge care responsibility. With the little funds ai have, I need to financially discipline myself to ensure a judicious use of the available money.

Stressing on how other family relatives have been negligent and noncooperative, especially in contributing to the care of their aged relation, a participant elaborated on how the enormity of the financial obligation on her has pushed her to be financially disciplined. Our interaction drew the following comments:

> I receive no help from nowhere. Not even from my family. I am here struggling with him. Everything about his care lies on me. The little I have; I manage and spend on him.

> My other siblings don't seem to care about whatever happens. They don't support care with money, neither do they even show any glimmer of concern. I only make good use of the little I have to care for my old father.

## Discussion

It has been argued that vulnerable groups like indisposed people, and more particularly older people within a larger population, require a form of caregiving to support their daily living and activities (Del Campo et al. 2000; Agyemang-Duah et al. 2019). Exploring women caregivers of older people's coping strategies in rural and urban Somalia can contribute to expanding literature by providing empirical evidence to this effect. The findings from this study revealed various forms of coping strategies adopted by caregivers to overcome hurdles saddling caregiving of older people.

The study findings suggest that as part of measures to contend with caregiving challenges,

caregivers believed that the social support they received from well wishers contributed essentially to the services they provided. These forms of support, ranging from kind to cash, enhanced their care for older people. This is a proof that social relations are very critical with regards to caregiving. The pertinence of social support to caregiving as identified in this study is consistent with the research findings of Wade et al. (2001) and Agyemang-Duah et al. (2019). Furthermore, taking financial assistance from close and distant relations was identified by the current study as very pertinent caregiving coping strategy. Caregivers took financial assistance from people to aid them in providing for the needs of service recipients. Findings from a study in Ghana identified financial assistance sought from people as effective to caregiving coping (Anokye 2018; Agyemang-Duah et al. 2019).

3In addition, the study findings revealed consolatory messages from relations to caregivers as a strategy that enhanced coping. According to this study, participants felt motivated to unflinchingly give out their best whenever words of encouragements are offered to them. This is in consonance with the research findings of Agyemang-Duah et al. (2019), Anokye (2018), and Arkorful et al. (2020). And finally, the study revealed that communication with associates was very essential to as far as caregiving coping strategies are concerned. In the estimation of participants, engaging relations, far and near in conversation, helped in reducing burdensome thoughts while at the same time relieving them of other psychological setbacks. As such, communication was deemed a therapy to enhancing caregivers coping.

Moreover, the study findings revealed that short breaks taken by caregivers are also essential to caregiving. Research has shown that caregiving could have negative consequences on the health of caregivers (Kim et al. 2012; DiGirolamo and Salgado de Snyder 2008) which makes the use of breaks and leisure an important part of caregiving. The study shows that such breaks provided caregivers an opportunity to take rest, and at the same have time to visit friends and relatives. This further helps caregivers to reduce intensive stress brought about by caregiving. Agyemang-Duah et al. (2019), Anokye (2018), and Arkorful et al. (2020) confirm stress as integral to caregiving. Taking intermittent breaks from caregiving engagements is confirmed by Agyemang-Duah et al. (2019).

Consistent with the findings of Agyemang-Duah et al. (2019), the current study found that caregivers' belief in Allah was an effective coping strategy for them. The study found that though caregivers appeared gravely challenged in discharging their duties, they however appeared resolute in serving because of the strong belief they have in Allah. The belief in Allah has contributed to caregiver's development of a strong conviction and mentality which has been confirmed in prior studies by Defrain and Olson (1999).

In addition to taking part-time assignments as part of measures to raise funds to complement caregiving and support services, the study confirmed caregivers' strict adherence to a more rational and stricter financial discipline as a way to cope with the demands of caregiving. Maintaining financial discipline as a coping strategy relative to caregiving has been confirmed in a study by Agyemang-Duah et al. (2019).

## Limitations of Study

The research focused on a relatively smaller population. The research was also restricted to rural and urban areas, respectively. For this reason, drawing a line of distinction between the coping mechanisms of caregivers in these geographically distinct areas becomes quite a challenging task. As such, these limitations call for caution in the replication and generalization of findings. It however in no way and dimension nullifies, weakens, or invalidates the validity and reliability of the study findings. Against the backdrop of these findings, the study recommends that stakeholders exert efforts to provide some forms of technical training to equip caregivers with the needed care support skills and knowledge. The study further recommends the creation of a national data base for the older people and their caregivers in Somalia. In addition to enhancing the realization of health-related sustainable development goals, this will also be very cardinal for marshaling and

deploying any effective and efficient policy design and implementation initiatives. Irrespective of these limitations, gathering data from across rural and urban caregivers can help provide varying perspectives on the challenges of caregivers with different experiences based on their diverse locations in the country. While these stands to provide rich perspectives for policy direction and prioritization, the findings from this seminal study could also serve as policy compass providing direction for government and non-government players in designing policies towards incepting support schemes for women caregivers and their care recipients.

## Conclusion and Implications

In investigating caregivers coping strategies, the study revealed social support from well wishers, taking intermittent caregiving breaks, belief in Allah, taking financial assistance and consolatory words from well wishers, taking part-time assignments, strict adherence to financial disciplinary measures, and engagement with associates are strategies adopted to enhance caregiving coping. The dearth of institutional support for the activities of informal caregivers calls for the attention of state and nonstate actors to institute measures that would go beyond placing some degree of paramountcy on extending care support services to caregivers and service recipients to providing other forms of clinical, psychological, and physiological assistance as well. This would help enhance their activities. Policymakers are equally not exempted in this regard. As such, it therefore behooves policy activists, to consider the findings of this study in instituting measures, such as formulating and implementing policy frameworks that would provide sufficient backbone for supporting caregiving.

# Cash Accounting

José Manuel Vela
Department of Economy and Social Sciences, Faculty of Business Administration, Universitat Politècnica de València, Valenica, Spain

## Synonyms

Cash basis of accounting; Cash flow accounting; Flow of financial resources accounting and cash basis

## Definition

Cash accounting is a method of recognition of the elements of financial statements based on the practice of recording revenues when cash is received and recording expenditures when cash is paid. Revenues and expenditures as well as assets and liabilities are therefore recognized according to the financial cash flows associated to them, regardless of the moment those are earned or owed.

## Introduction

Cash accounting is a method of recognition of the elements of financial statements that can be used for financial reporting purposes. It can be adopted alternatively with other two recognition methods such as Accrual Accounting and Modified Accrual Accounting, both based on the accruals concept, according to which income and expenses are recorded in the period in which earned or incurred, regardless of the timing of the associated cash flows.

The choice of the proper method of recognition of elements of financial statements is an essential part of the conceptual framework of accounting, closely related to the objectives of financial reporting.

In order to understand what cash flow accounting really is we will focus our attention in its conceptual dimension, its main differences with other methods of recognition, and its main advantages and disadvantages.

## Conceptual Framework and Recognition of Elements of Financial Statements

A conceptual framework defines and establishes a coherent system of concepts and principles related with the objectives that identify the general purpose of financial reporting. Concepts and characteristics in a conceptual framework provide guidance on identifying the qualitative characteristics and boundary rules of financial reporting. Furthermore, recording rules in a conceptual framework are essential to determine the transactions, events, and circumstances to be represented (elements of financial statements); when and how they should be recognized (methods of recognition) and measured; and how they should be represented and reported in the financial statements.

A conceptual framework is usually adopted by regulators and professional accountancy bodies who set accounting standards in order to use a soundly developed set of concepts useful to issue widespread understandable and consistent pronouncements that develop accounting standards by specifying additional definitions and requirements. In the international context, the most representative accounting-standards-setting bodies are the International Accounting Standards Board (IASB) for private entities and the International Public Sector Accounting Standards Board (IPSASB) of the International Federation of Accountants for governmental accounting entities. Both bodies have developed their own conceptual framework (IASB 2015) and actively work in the periodic issue of publications in order to assist preparers and users of financial statements.

## Accounting Methods of Recognition: Measurement Focus and Basis of Accounting

A method of recognition requires defining two main concepts that will determine which elements of financial statements will be finally reported:

- The **measurement focus** (what kind of elements are recognized)
- The **basis of accounting** (the moment when elements are recognized)

If we refer to **measurement focus**, two alternative focuses can be considered:

### The Flow of Financial Resources Measurement Focus

When the *"flow of financial resources*" measurement focus is adopted, the focus is on cash, assets expected to be turned into cash, and liabilities to be repaid within the accounting period or shortly thereafter. This measurement focus aims to determine whether the financial resources obtained during the accounting period are enough to cover all claims made against the entity during the same period. The operating results expressed using this measurement focus show the extent to which financial resources obtained during a period are enough to cover claims incurred during that period against financial resources. This measurement focus considers financial resources only.

### The Flow of Economic Resources Measurement Focus

The "flow of economic resources" measurement focus measures all assets that are available to the entity, not only cash or soon to be cash assets. Both long-term assets and long-term liabilities are measured when using the "flow of economic resources" measurement focus. In addition, depreciation is also recorded as a cost of operations, as well as other figures such as provisions, risks, and other accrued expenses or revenues not associated with any cash flow.

The flow of current financial resources is usually adopted to report on the budget of governmental entities in a great number of countries, where expenses such as depreciation or assets impairments are not recorded in the expenditures budget accounting system.

The flow of economic resources is usually adopted by business entities to calculate the profit

or loss of the period that is reported in the income statement.

Cash-basis accounting recognition system will always be based in the flow of financial resources focus and not in the flow of economic resources. The difference between both flow concepts is narrowly related with the difference between the concepts of **"expense"** and **"expenditure,"** which are often used as equivalent, even if they are not.

An **expense** can be defined as "money spent or cost incurred to generate revenue, representing the cost or consumptions incurred when doing business". Some expenses may adopt the form of actual cash payments (such as wages, salaries, or supplies), whereas others are bookkeeping entries, not associated with flows or allocations of cash (depreciation or impairments of assets). All expenses are costs and are charged in the income statement at some point over time, even if not all costs are expenses (for example, the cost of acquisition of an asset is considered an investment that will be treated as an expense year by year as the useful life of the asset is being used up). Consequently, an expense is a cost that has expired and has been used up in order to obtain the revenue that is recognized during a period.

Expenditure is defined as "a payment in cash or barter credits, or the incurrence of a liability by an organization, in exchange for goods or services. Evidence of the documentation related with expenditure is a sales receipt, a bill, or an invoice. Expenditure is always associated to a present or future cash flow." An expenditure may be recognized for the purchase of an asset, a reduction of a liability, a distribution to the owners or an expense.

Consequently we can find expenditures that are expenses (wages and salaries), expenditures that are not expenses (the increase in assets or the reduction of liabilities, prepaid expenses), and expenses that are not expenditures (depreciation, impairments, accrued interest due. . .).

Usually, in business-oriented entities, profit or loss is calculated by comparing revenues and expenses. On the contrary, in governmental entities, as for example in Spain and other European countries, budgetary deficits or surpluses are obtained by comparing revenues and expenditures, but not expenses.

Obviously, the recognition system used in cash-basis accounting will always focus its attention on expenditures, even if, as we will see later, not all expenditures are recognized under pure cash-accounting recognition systems.

When we refer to the **basis of accounting**, the relevant question is to determine the moment of time when a certain element (a revenue or expenditure) is recognized. For example, expenditure such as a salary, cost of electricity or water supply, or the purchase of an asset to obtain future profits can be recorded when paid or owed. In this sense, a revenue can also be recorded when due or when cash is collected.

According to the moment of time when elements of financial statements are recognised, three alternative basis of accounting can be distinguished:

**Cash Basis**: transactions are recorded when cash inflows or outflows are incurred. As for the recognition of revenues, expenditures, assets, or liabilities, the key moment is when a cash transaction occurs, regardless of the moment an element is owed or due. For example, if a corporation incurs in expenditure or purchases of an asset, no accounting entry will be recorded until the moment the expenditure or the asset is paid. Likewise, concerning revenues, these will be reported on the income statement only when cash is received.

For example, if a company purchases in December of year X a machine and starts to use it, but the machine will be paid on March of year X + 1, no accounting entry will be recorded until March X + 1, and annual accounts of year X will not report any asset acquisition.

The concepts of cash basis and cash accounting are often used as equivalent even if cash accounting is a broader concept that is also concerned with a measurement focus based on financial resources instead of economic resources.

**Accrual Basis**: under the accrual basis of accounting, revenues are reported on the income statement when they are earned, even if cash has not yet been collected. Expenses are matched with the revenues and reported when the expense

occurs, not when cash is paid. The result of accruals-basis accounting is that assets and liabilities are fully and fairly reported in the balance sheet, while the income statement measures accordingly the profit of a company during a specific period of time.

For example, if a service company provides a support activity to a customer in December, issuing in the same month an invoice of 100.000 € and does not receive any money from the customer until January of the following year, there will be a clear difference between the income statements for December and January under the accruals and cash basis of accounting. Under the accruals basis, the income statement will show revenue in December, and no revenue will be reported in January. Under the cash basis, no revenue will be reported until January, even if the service was provided in December.

The concepts of accruals basis and accrual accounting are also sometimes considered as equivalent, even if, again, the concept of accrual accounting presents a broader meaning than the concept of accrual basis. In fact, a possible recognition method could use for example an accrual basis with a measurement focus based on the flow of financial resources. This method of recognition should be very close to a new recognition method that can be considered closer to the concept of modified accruals.

**Modified Accrual Basis**: under this method of recognition, revenues are recorded in the period they become available and measurable, and expenditures are recognized in the period the associated liability is incurred. Even if under this basis some expenses are also recognized, most of them are not reflected, especially those accrued and unmatured and those that are not associated with the use of financial resources (risk provisions, impairments of assets, depreciation of fixed assets). It is essential to point out the difference between the depreciation of an asset and the impairment of its value: depreciation is recorded as a continuous and irreversible cost associated to the usage of an asset's useful life over the time between its acquisition and obsolescence, while on the contrary impairment is not continuous nor irreversible, it is usually due to a fact not easily predictable that may affect an asset's value at a certain point, but once the circumstance disappears, the impairment charge can be reversed.

Modified Accrual Basis is mainly used in governmental entities, usually for budgetary accounting purposes, in most European countries as Spain, France, or Italy. Sometimes, accounting literature defines this basis also as a modified cash basis.

The relationship between cash, accrual, and modified accrual accounting is shown on Table 1.

Internationally, the tendency of choosing one of these different accounting recognition methods is very diverse. In business accounting, the generally accepted and recommended accounting recognition method by accounting standards and conceptual frameworks is accruals-basis accounting. In governmental accounting, and nonbusiness accounting also, the situation is more varied and sometimes different solutions are adopted by public entities in a same country depending on the level of Public Administration considered (central, regional, or local).

Modified basis of accounting is quite extended in the field of budgetary accounting, and accrual accounting for financial accounting purposes (financial position and economic result determination). Other countries develop an accruals basis in the whole accounting system (budget and financial accounting).

But one fact is clear: Cash accounting is considered absolutely obsolete and not recommended by international accounting standards and conceptual frameworks in force.

According to the IASB's conceptual framework (IASB 2010), the elements of financial statements that must be recognized are:

ASSETS: *A resource controlled by the entity as a result of past events and from which future economic benefits are expected to flow to the entity.*

LIABILITIES: *A present obligation of the entity arising from past events, the settlement of which is expected to result in an outflow of resources from the entity when payments are due.*

EQUITY: *The residual interest in the assets of the entity after deducting all its liabilities*

**Cash Accounting, Table 1** Cash accounting, modified accrual accounting and accrual accounting

| | Cash accounting | Modified cash/ accrual accounting | Accrual accounting |

Source: by the author

The elements of income and expenses are defined as follows:

INCOME: *Increases in economic benefits during the accounting period in the form of inflows or enhancements of assets or decreases of liabilities that result in increases in equity, other than those relating to contributions from equity participants*.

EXPENSES: *Decreases in economic benefits during the accounting period in the form of outflows or depletions of assets or incurrences of liabilities that result in decreases in equity, other than those relating to distributions to equity participants*.

The International Public Sector Accounting Standards Board (IPSASB) of the International Federation of Accountants also recognizes as elements of financial statements assets, liabilities, and expenses and includes other elements as revenues, net financial position, surplus or deficit for the period, ownership contributions, and ownership distributions defined as follows (IPSASB 2014, paragraphs 5.6–5.37):

REVENUES: *Increases in the net financial position of the entity, other than increases arising from ownership contributions*.

NET FINANCIAL POSITION: *The difference between assets and liabilities after adding other resources and deducting other obligations recognized in the statement of financial position. Net financial position can be a positive or negative residual amount*.

ENTITY'S SURPLUS OR DEFICIT: *The entity's surplus or deficit for the period is the difference between revenue and expense reported on the statement of financial performance*.

OWNERSHIP CONTRIBUTIONS: *Inflows of resources to an entity, contributed by external parties in their capacity as owners, which establish or increase an interest in the net financial position of the entity.*

OWNERSHIP DISTRIBUTIONS: *Outflows of resources from the entity, distributed to external parties in their capacity as owners, which return or reduce an interest in the net financial position of the entity.*

## The Use of Cash-Basis Accounting as a Method of Recognition: Advantages and Disadvantages

Considering previous comments, cash accounting is not recommended as an accounting method of recognition by international accounting standards,

which rather enforce the use of accruals-basis accounting for business entities or modified accruals accounting for budgetary accounting in Governmental Entities.

This is clearly due to the fact that cash basis only records cash inflows (receipts) and cash outflows (disbursements). Consequently, cash basis presents considerable disadvantages mainly related with the following facts:

1. It does not allow the assessment of significant figures and features such as:
   - Financial Position of the entity: Receivables and payables are not recorded, so obligational rights and claims are not shown in the financial statements. Likewise, assets whose purchase has not yet been paid at the end of the period as well as a significant set of liabilities are not registered until fully paid.
   - Profit or Loss (Deficit or Surplus) in the income statement considering that only revenues, expenditures, and expenses associated with cash flows in the period is recorded.
   - A fair and complete position of assets, liabilities, equity, or net financial position.
   - Changes in financial position and in assets and liabilities.
   - Economic resources and claims.
   - Information about the efficiency and effectiveness of the use of entity's resources.
   - Relevant information about the main costs expired and incurred.
   - Error checking and assessment.
2. The simple use of a cash accounting system does not comply with generally accepted accounting principles at international level (GAAP) in most countries, such as matching concept, accrual principle, or going concern.
3. Cash accounting is not compatible with the qualitative characteristics of accounting information required to provide useful financial information at the level of generally accepted conceptual frameworks, such as relevance, faithful representation, comparability, verifiability, timeliness, or understandability.

Obviously, a vast majority of companies prepare interim statements or final statements on cash position using cash accounting for internal purposes mostly, but this is only a small part of the financial information that is required to assess the financial position of the entity.

The greatest advantage of cash accounting is perhaps its simplicity. This is why it is only mostly recommended for very small businesses, using a single entry system of bookkeeping for a relatively reduced number of transactions per day or week and a small number of employees.

Cash accounting can also be appropriate for small businesses that do not sell on its own credit and that deliver goods or services once cash has been paid with money or an equivalent (credit or debit card for example). As well as for small businesses that own few physical and expensive assets, not including land and equipment, buildings, machinery, hardware and software, or complex furniture. Moreover, it can be appropriate for very small businesses that are not required to prepare complete financial statements, privately held by a single owner.

Finally, it is appropriate to point out that cash accounting may be useful for tax-reporting purposes, supporting the company's compliance with tax obligations considering that these are often based in cash inflows or outflows registered within the fiscal year. It can also be useful for budgetary or accountability purposes, especially in governmental and nonbusiness organizations.

As it has been said before, cash accounting is not recommended as an accounting method of recognition by international accounting standards. Anyway, it can be considered that its use remains quite extended in many countries accordingly, for example, with the conclusions of a 2013 PwC Global Survey (PWC 2013) on accounting and reporting by central governments. This survey reached two clear conclusions:

- In 2013, Accrual accounting was adopted only by a 26% of the countries, and Accrual budgeting only by 11%. Europe, Australia, New Zealand, and North America are the areas where accrual accounting is most

adopted. Cash accounting adoption is mainly extended in Africa and Asia
– In 2018, accrual accounting will be adopted by a 63% of countries at central government level.

This survey evidences that the trend towards accrual accounting from cash accounting is at the moment a clear and relevant fact and that the situation is changing quite quickly. This is perhaps why the IPSASB has yet developed International Public Sector Accounting Standards (IPSAS) that apply to the accrual basis of accounting but also a comprehensive Cash Basis standard that encourages entity to voluntarily disclose accrual-based information, although its core financial statements will nonetheless be prepared under the cash basis of accounting. The IPSASB also attempts to facilitate compliance with accrual based IPSASs through the use of transitional provisions in certain standards (IPSAS Handbook 2015, paragraphs. 8, 16 & 17).

## Conclusion

The above considerations aim to present the main characteristics of cash accounting and its usefulness, advantages, and disadvantages in comparison to other methods of recognition, such as accruals accounting and modified accruals accounting. Definitions of measurement focus and basis of accounting have been given in order to evaluate if cash accounting provides a fair and reliable financial reporting.

Considering that cash accounting emphasizes cash inflows and outflows, the conclusion is that cash accounting is not an appropriate method for the recognition of transactions, due to its significant disadvantages in contrast with accrual or modified accrual methods for the recognition of elements of financial statements. The requirements of the conceptual frameworks of accounting at international levels concerning the objectives of financial reporting, the qualitative characteristics of business information, and the principles to be included in annual reports are consistent reasons to reject the use of cash accounting in private and public sector accounting entities, being preferable to adopt an accruals-based position.

## Synonyms

Treasury management

## Definition

Cash management may be defined as the right amount of money in the right place and time to

meet the government's obligations in the most cost-effective way. Moreover, cash management is the processes for managing cost-effectively the government's short-term cash flows and cash on hand, both within the government and between the government and other entities. According to these definitions, the time value of government money and an active cash management of temporary cash surpluses and temporary deficits are highlighted.

## Introduction to the Treasury Function and Cash Management

Governments aim at ensuring both the efficient implementation of the budget and good management of the financial resources. Spending agencies must be provided with the funds needed to implement the budget in a timely manner, and the cost of government borrowing must be minimized. Moreover, sound management of financial assets and liabilities is also required.

Financial management within the government includes several functions:

- Formulation of budgetary and tax policies
- Budget preparation and execution
- Management of the financial operations associated with the execution of the budget
- Definition of accounting rules and financial information systems
- Auditing and evaluation of financial performances and results of government policies

Within this broad financial management framework, the primary mandate of a national treasury is to optimize the financial management of government resources by ensuring that spending agencies provide the resources needed to implement the budget in a timely manner, while minimizing the cost of government financing. The Treasury is generally responsible for the management of government financial assets and liabilities (Allen and Tommasi 2001).

More specifically, the Treasury functions cover some or all of the following activities:

- Cash management
- Management of government bank accounts
- Financial planning and forecasting of cash flows
- Public debt management
- Administration of foreign grants and counterpart funds from international aid
- Financial assets management

The organizational arrangements of these activities and the distribution of responsibilities among the various government agencies in each country are affected by historical and cultural factors as well as the economic environment. More frequently the Treasury focuses only on cash and debt management functions (which are discussed more fully below); less frequently the Ministry of Finance is primarily responsible for all the above activities; in a few instances, one or more of these activities are assigned to other agencies.

## Objectives of Cash Management

As stated above, most definitions of cash management emphasize the time value of government money (Storkey 2003). A government must therefore be able to fund its expenditures in a timely manner and meet its obligations as they fall due. Other definitions emphasize an active cash management of temporary cash surpluses and deficits (Williams 2004). Thus, cash management may be seen as a management tool to ensure on one hand that sufficient cash is available to meet current and future liabilities, while on the other that any surplus is safely invested so as to generate the maximum income. Moreover, all these definitions include cash management within the government sector and the government's interaction with other sectors, particularly the financial sector.

Generally speaking, cash management is necessary because there are mismatches between the timing of payments and the availability of cash. Even if the annual budget is balanced, with realistic revenue and expenditure estimates, in-year budget execution will not be smooth, since the timing of both cash inflows (which in turn depend

on tax and nontax flows, as well as the timing of grant or loan disbursements) and outflows can result in conditions of temporary cash surpluses or temporary cash shortfalls (Lienert 2009).

A modern cash management has the following objectives:

- Implementing the budget efficiently
- Reducing the cost of government borrowing
- Maximizing return on excess operating balances

Moreover, for efficient budget execution, the government must ensure that claims will be paid according to the contract terms and revenues will be collected on time. It is also necessary that payments must be made on a timely basis by choosing accurately the dates on which they are due.

The objectives of cash management therefore involve collecting revenues owned to the government, bringing funds into the government's treasury as quickly as possible, paying the government's operating expenses, investing funds until they are needed for use, and safeguarding the funds throughout the cash flow cycle. On occasion, a government may find that it has a revenue shortfall during the fiscal year and may need to borrow funds to bridge this gap (Fig. 1 shows an example of the cash management cycle).

Often in the past, countries were not concerned about the issues related to efficient cash management due to budget execution procedures and the management of cash flows focusing on compliance issues. Daily cash needs were met by the Central Bank. As a consequence, the spending units did not pay attention to the borrowing costs since these interest payments were already taken into account in the budget prepared by the Ministry of Finance.

However, in the last twenty years, the introduction of some macroeconomic targets, such as the costs of borrowing, the measure of credit granted to the government by the banking system, the increasing separation between the activities of the Central Bank, and the government budget have had an impact on cash management. As a consequence, some countries have implemented reforms in order to make spending agencies more responsible for cash management and control, while maintaining instruments to ensure fiscal discipline.

## The Control of Cash Flows

Cash management, as a basic and fundamental activity of the Treasury, includes the control of all flows to and from government accounts, as well as the operational activities in the collection and payment processes. As its minimum and fundamental responsibility, the Treasury must secure complete, timely, and accurate information as well as exercise control on all the inflows and outflows in the government's accounts (Larson 2007).

Generally speaking, governments collect funds from a variety of revenue sources, including fines, fees, taxes, licenses, permits, and special assessments. For an efficient cash management, the control of cash inflows means that the interval between the time when cash is received and the time it is available for carrying out expenditure programs should be minimized. Collected revenues need to be processed promptly and made available for use. In addition, governments should

**Cash Management, Fig. 1** Cash management cycle. (Source: Adapted from Larson 2007)

not only strive to collect all the monies owned by making the payment process simple and easy for their citizens but also collect any overdue accounts. Consequently, the organization of tax administration offices may have to be reviewed and their equipment modernized. Moreover, the commercial banks are often able to collect revenues more efficiently than tax offices. As a consequence, these offices should focus on tracking taxpayers, issuing tax assessments, monitoring payments and reporting results. When revenues are collected by commercial banks, some rules about this process must be defined in order to ensure the prompt transfer of collected revenues to government accounts. Finally, an appropriate system of penalties for taxpayers should also be an important element in avoiding delays in revenue collection.

Regarding the expenditure side, the main purpose of controlling cash outflows is to pay the government's obligations in a timely and cost-effective manner. For an efficient control of cash management, an equally important objective is to ensure that there will be enough cash until the date payments are due and to minimize the costs of transactions, while keeping cash outflows compatible with cash inflows and fiscal constraints. By knowing its disbursement requirements, the finance official can make effective investment decisions. The first condition for ensuring that cash outflows fit fiscal constraints is a good budget preparation and implementation covering both cash and obligations. In addition, during budget implementation, the cash outflows must also be regulated through cash plans so as to smooth them.

Regarding the investment function, over the years, governments have been granted increased authority over how they can invest their excess funds. This expanded investment authority has allowed governments to increase their investment income. However, it is necessary to balance the desire to earn additional investment income with the need to protect the entity's funds. As a consequence, a good cash flow forecasting may determine when the government will have funds to invest, how much money the government will have to invest, and for how long the funds can be invested.

In addition, it is necessary to protect the funds during all the phases of the cash management cycle by implementing effective internal controls and funds concentration procedures, controlling public deposits over the centrally insured limits, along with establishing good working relationships with both financial institutions and any other business partners.

Finally, it should be noted that the payment methods affect the transaction costs of cash flows.

Over the past two decades, the banking industry has created new products, which have played an important role in changing cash management practices. Modern methods of payment (e.g., the payment through an electronic fund transfer or a credit card) allow the government to plan its cash flow more accurately, accelerate payments, as well as simplify administrative and accounting procedures.

However, the choice of the payment model depends on numerous factors, such as the degree of economic development of the country and the banking infrastructure. Generally speaking, good cash management is facilitated when all the government transactions take place through a modern banking system. This means that commercial banks are networked electronically with their own branches and the interbank regulation is well established and integrated with the central bank's payment system. Moreover, modern treasuries should avail themselves to such tools and use electronic revenue transmission and payment methods.

## Banking Arrangements and Centralization of Cash Balances: The Treasury Single Account

Government banking arrangements are an important factor for the efficient management and control of the government's cash resources (Modlin 2014). Such banking arrangements should be designed to minimize the cost of government borrowing, maximize the opportunity cost of cash resources, and investing temporary surpluses productively. This requires ensuring that all the cash received is available for carrying out the

government's expenditure programs and making payments in a timely fashion.

However, poor banking and technological infrastructures in some developing countries are sometimes an obstacle to establishing a unified structure of government bank accounts. Many developing countries have fragmented systems for handling government receipts and payments; as a result, the ministry of finance/treasury lacks a centralized control over the government's cash resources, with the payment transactions being made through an imprest procedure.
Geographically remote spending units can have separate bank accounts operated by imprest advances. In this model, an initial imprest advance is provided by the treasury department. Thereafter, the expenditures made from the imprest account are reimbursed by the treasury department on receipt of an account verifying the use of the previous advance. By this way, spending agencies often accumulate idle balances in their bank accounts. These idle balances increase the borrowing needs of the government, which must borrow to finance the payments of some agencies, even if other agencies have a cash surplus.

In addition, in countries with an underdeveloped banking infrastructure, sweeping bank accounts daily or managing a system of credit limit could pose problems. In fact, the existence of a large number of bank accounts can hinder the implementation of appropriate daily clearing and consolidation procedures. In these cases, the Treasury does not perform a daily clearing of the balances of the line ministries accounts with the Central Bank. Therefore, despite a positive balance with the Central Bank, the government has to borrow from the financial markets.

Establishing a unified structure of government bank accounts via a Treasury Single Account will solve these problems, promoting a good and active cash management.

Treasury Single Account (TSA) is a unified structure of government bank accounts that gives a consolidated view of government cash resources. The consolidation of the government cash resources encompasses all the government cash resources, both budgetary and extra-budgetary. This means that all public money (regardless of whether the cash flows are subject to budgetary control or not) should be brought under the control of the TSA. The cash balance in the TSA main account is maintained at a sufficient level to meet the daily operational requirements of the government.

Based on the principle of the unity of cash and the unity of treasury, a TSA is a bank account or a set of linked accounts through which the government transacts all its receipts and payments. Generally speaking, establishing a TSA usually requires a legal basis to ensure its robustness and stability. Being legally recognized is thus a precondition that is particularly important in those countries where the presumed autonomy of some institutions is an obstacle to the implementation of a TSA (Pattanayak and Fainboim 2010).

In order to gain a proper understanding of TSA, two main elements need to be investigated:

1. TSA structure (section "The Treasury Single Account Structure")
2. Centralization of payment transactions under a TSA structure (section "Centralization of Payment Transactions Under a Treasury Single Account Structure")

## The Treasury Single Account Structure

There are several variants of the TSA structure that can be broadly grouped into centralized and distributed TSA architectures. The TSA systems established in most countries fall somewhere between these two models and involve various types of bank accounts (Tommasi 2007).

(a) *Centralized TSA architectures*

The TSA consists of only one central account, through which all the payment transactions are made.

The main bank account of this TSA system is held at the central bank and is used for receiving all the government revenues and making government payments. The government payment function can be centralized, and the main operational account of the TSA at the central bank can plan all disbursements.

(b) *Distributed TSA architectures*

The TSA includes several subaccounts, and payments can be decentralized; more specifically, it is organized according to the following lines: (1) line ministries hold accounts at the central bank, which are subsidiary accounts of the treasury's account, and (2) spending agencies hold accounts either at the central bank or, for banking convenience, with commercial banks that must be authorized by the treasury.

By this way, spending agencies' accounts are zero-balance accounts due to money being transferred to these accounts if specific approved payments are made (or the banks accept the payment orders sent by spending agencies up to a certain limit defined by the treasury); as a consequence, they are automatically deleted at the end of each day (where the banking infrastructure allows for daily clearing). Finally, the central bank consolidates the government's position at the end of each day, including the balances in all the government accounts.

Sometimes, when the central bank does not have an adequate network of subbranches or lacks the capacity to handle the large volume of government payments and receipts, the retail banking operations are delegated to a fiscal agent (normally an authorized commercial bank). In this case, the fiscal agent makes payments on behalf of the treasury, the central bank regains all these payments of the government operations, and, finally, the fiscal agent makes daily deposits of all the government revenues to the TSA in the central bank. By this way, the payment processes are managed by the treasury, and the government agencies are directly responsible for authorizing any payments.

## Centralization of Payment Transactions Under a Treasury Single Account Structure

There are two primary methods of centralizing transactions and cash flows under a TSA structure.

The *first model* is based on the *centralization of payment transactions*. Under this model, requests for payments are prepared by individual budget agencies and sent to the treasury for control and execution. The treasury manages the float of outstanding invoices. In this case, the central unit processes and records all flows and cash balances to the appropriate ledger account; individual spending agencies are treated as distinct accounting entities through a treasury ledger system. In this case, the treasury (supplemented in some countries by a network of regional treasuries) provides payment services for spending agencies and has the exclusive authority to access and operate the TSA, including its regional treasury subaccounts. The budget institutions submit their payment requests to the centralized treasury before making any payments (an example of the payment via centralized Treasury is shown in Fig. 2).

This model may create a useful synergy between cash management, on the one hand, and expenditure control and transaction, on the other. However, the centralization of payment transactions can also lead to inefficiencies, including high transaction costs, and even corruption, in countries with poor governance, particularly where the treasury is responsible for selecting the suppliers to be paid.

The *second model is associated with a centralization of cash balances only*. Under this model, the budget agencies process and make payments directly to suppliers; more specifically, during

**Cash Management, Fig. 2** Payment through centralized treasury. (Source: Adapted from Tommasi 2007)

budget execution, each budget institution processes its own transactions and operates the bank account under a TSA system. The treasury, through the budget implementation plan, sets periodic cash limits (monthly or quarterly) for the total amount of disbursements to be made but does not control any individual transactions.

In this case, the TSA consists of several bank accounts. These accounts may be held only at the Central Bank or in several other banks.

The banks accept the payment orders sent by spending units up to a certain limit defined by the Treasury or the budget implementation plan. These accounts are cleared every day, and their balance is transferred to the central account of the Treasury (an example of the payment via spending agencies' bank accounts is shown in Fig. 3).

This model makes the spending agency responsible for internal management, while keeping central control of cash through the TSA. Moreover, payments can be made through banks selected on a competitive basis.

## Designing a Modern Cash Management System

Generally speaking, the efficiency of a cash management system, including its capability for immediate reporting, is dependent on the availability of revenue and expenditure information at different stages of the budget execution cycle (Allen and Tommasi 2001).

By this way, from a cash management point of view, the feasibility of the centralization of payment transactions under a TSA structure depends on several factors, such as (*a*) the quality of the country's technological and banking infrastructure and (*b*) the control functions that are assigned to the treasury department responsible for managing the TSA.

Regarding the level of technological development of the banking sector and the government (*sub a*):

- Modern technology allows for electronic links between spending agencies, the Central Bank (or the commercial banks), and the offices of the Treasury. In a computerized environment, tracking of transactions at different stages of the budget execution cycle and reporting on payments and expenditure should not be a problem regardless of whether a centralized or decentralized model is selected. The concept of a general ledger system (GLS), which is a system into which all the transactions are recorded, can fit either decentralized or centralized accounting controls and payment processing systems.
- Conversely, poor banking and technological infrastructures in some developing countries are sometimes an obstacle to combining the

**Cash Management, Fig. 3** Payment through spending agencies' bank accounts. (Source: Adapted from Tommasi 2007)

centralization of cash balances with a decentralization of payment processing. In a manual environment, information about outstanding commitments and payables (which is needed for cash planning and management) is not always available on time due to such information being maintained by respective spending agencies. Additionally, as stated above, in countries with an underdeveloped banking infrastructure, the daily clearing of accounts with various banks could be more difficult than daily settlement within a set of accounts at the Central Bank. Maintaining a large number of accounts could therefore also hinder the implementation of appropriate clearing and consolidation procedures.

Regarding the control functions assigned to the treasury department (*sub b*), centralizing cash flows allows payments to be monitored in a timely manner, but does not release spending agencies from their reporting obligations. This is because the effective supervision of budget execution requires commitments to be monitored and expenditure to be verified.

Nevertheless, experience shows that in developing countries, the Treasury centralizes its internal cash balances and global information on cash outflows and inflows, but the centralization of payment transactions is not systematic and the data are aggregated to allow for a sound analysis of budget execution. By this way, cash flow monitoring is insufficient to control budget execution, and arrangements for cash management aim implicitly at supporting ailing banks. Moreover, in several countries, entrusting the management of the government accounts to commercial banks could burden the banks with the government's cash problems, particularly if the treasury is not able to meet its obligations. Restructuring the banking system in these countries is a policy issue that should be addressed.

In addition, reform of the cash management system must take into account its possible impact on budget management within spending agencies as well as be cost effective. The centralization of cash balances within a single account is meant to optimize cash management. It avoids borrowing and paying additional interest charges to finance the expenditures of some agencies, while other agencies keep idle balances in their bank accounts.

Implementing a system that centralizes cash management does not pose major problems for the central departments of line ministries. It is generally advisable for the central departments of line ministries to replace an imprest system with a system that centralizes cash. Moreover, for regional departments, the organization of the payment system must take into account the system of public administration and banking infrastructure in the country concerned. Often, developing countries have different arrangements within their payment system according to the location of the spending agencies.

Therefore, a first step in streamlining cash management would consist of (i) the daily centralization of transactions made at the central level and, (ii) for decentralized agencies, a procedure based on imprest advances. Since most countries use the greater portion of their cash either for transactions at the central level (e.g., debt payment and expenditures managed by the central departments of line ministries) or for payments that are due on a fixed date (e.g., wage payments), such arrangements would allow most cash balances to be centralized.

## Conclusions

Cash management represents one of the most basic and fundamental activities of the Treasury, including the control of all the flows to and from the government's accounts, as well as operational activities in the collection and payment processes. The previous sections focused on the definitions and objectives of cash management as well as on the design of government banking arrangements, including some key features of the payment system for an efficient cash management.

In particular, TSA structures described in the previous sections would:

- *Allow complete and timely information on government cash resources*. In countries with advanced payment systems, the information

about the government cash resources is shared on time between the central treasury, revenue-collecting agencies, spending ministries, and/or treasury branch offices. As a minimum, complete updated balances should be available daily.

- *Improve appropriation control during budget execution*, providing the Ministry of Finance with full control over budget allocations, thus strengthening the authority of the budget appropriation. Moreover, the treasury, having all the information about the cash resources, can plan and implement the budget execution in an efficient, transparent, and reliable manner.
- *Facilitate efficient payment mechanisms as well as reduce bank fees and transaction costs*. A TSA structure ensures that there is no ambiguity regarding the volume or location of the government funds, while making it possible to monitor the payment mechanisms more accurately. Moreover, this structure allows for the elimination of the "revenue and expenditure float" in the banking and payment systems due to the TSA government bank accounts having zero balances at the end of each working day. Finally, it should be noted that the establishment of a TSA is usually combined with the reduction of the number of the bank account results; by this way, many governments have achieved substantial reductions in their administrative costs for maintaining these accounts, including banking fees as well as the cost associated with bank reconciliation.
- *Improve bank reconciliation and quality of fiscal data*. A TSA allows for the effective reconciliation between the government accounting systems and cash flow statements from the banking system. This reduces the risk of errors in the reconciliation processes and improves the timeliness and quality of the fiscal accounts.
- *Lower liquidity reserve needs*. A TSA reduces the volatility of cash flows through the treasury, thus allowing it to maintain a lower cash reserve/buffer to meet unexpected fiscal volatility. However, poor banking and technological infrastructures in some developing countries are sometimes an obstacle to establishing a unified structure of government bank accounts. Many developing countries have fragmented systems for handling government receipts and payments; by this way, the ministry of finance/treasury lacks a centralized control over the government's cash resources. As a result, spending agencies often accumulate idle balances in their bank accounts. These idle balances increase the borrowing needs of the government, which must borrow to finance the payments of some agencies, even if other agencies have excess cash.

In conclusion, establishing a unified structure of government bank accounts via a Treasury Single Account would promote a good and active cash management, it should therefore receive priority in any public financial management reform agenda.

## Cash Management in the US Accounting Systems

Steve Modlin
National Coalition of Independent Scholars, San Antonio, TX, USA

### Synonyms

Budget stabilization; Fiscal stability; Government savings; Liquidity; Public finance

### Definition

Cash management is the proper utilization and management of government funds in order to provide maximum levels of interrupted service in conjunction with the maintenance of substantial reserves which are continually accruing interests.

### Introduction

Maintaining an adequate cash flow is vital to sustaining government services at all levels of government. The most notable expected expenses are in the forms of salaries and benefits, but additional expenses in the form of facility maintenance, equipment purchase and repair, and various types of insurance including health care, lawsuits, and risk assessment liabilities are included as well. Unfunded liabilities associated with retirements are emerging as a major funding problem for many local governments.

These factor points not only illustrate the need for a sound cash management policy, but a policy which has support components that can withstand constant service demands. Effective cash management policies have six primary objectives according to Larson (2004): proper management and liquidity sustainability, maximizing the acceleration of collections, maximizing investment earnings, incorporating policies that reduce the need to borrow, maintaining high levels of efficiency in the management of disbursements or payables, and providing timely and accurate reporting. The final objective encompasses a clean audit. All six objectives can be achieved through adequate cash mobilization, exercising safe investment opportunities, and proper utilization of available bank services.

### Cash Mobilization

Effective cash mobilization consists of increasing the amount of time cash is held by a government unit in order to maximize investment opportunity and subsequently eliminate payables. In order to accomplish this goal, governments must reduce process time, or float (the time it takes to deliver and process receivables for either payment or investment). Traditional forms of payments such as hard currency or paper checks actually increase float time due to the time it takes for processing which can include reception at government offices with daily bank delivery. Alternate forms of electronic commerce have become rather prominent in reducing float time for large payments, especially intergovernmental transfers. First, governments are now allowing online payments through credit and debit card payments. Once received, the funds are immediately credited to the proper accounts. Second, the wire transfer has proven effective in reducing remittance time by days compared to traditional mail. However, governments have to determine if the service is worth the costs and, in some cases, if the remittance monies will cover

the cost of the service (Coe 2007). Third, the Automated Clearing House (ACH) system has become a popular form of electronic transfer due to its lower cost usually as a result of traditional bank service packages. The availability time for collections is also extremely valuable for governments since it can be as little as 1 day. Although more expensive, the wire transfer was found to reduce float by approximately 1 day compared to the ACH (Modlin 2014). Local governments have also used the ACH for smaller payments as well, but the continual increases in efficiency have precipitated use for virtually every type of payment.

The intermittent payments to governments can increase float time depending on the type of bill or fee and, in many cases, expanded due dates for payment. Some governments attempt to combat float by initially offering discounts on early payments, especially property taxes. To further reduce receivable time, governments may employ the use of a lockbox or a zero balance account (ZBA). The lockbox is very similar to a traditional post office box. The service is normally provided by a bank (or other third-party vendor) with payment availability 24 h a day. As part of the service, banks retrieve the payments, perform all processing, and post receivable information daily, thus substantially reducing float time for staff. The ZBA allows governments the opportunity to not only reduce processing time but place monies in various accounts according to need. At the end of each day, the ZBA is brought to zero with the funds placed in a concentration account and subsequently distributed to other accounts as directed. Extra funding may remain in the concentration account for bank service fees. With both services, it is important to determine the cost-effectiveness of the service by examining the amount of float reduced and other costs versus potential interest earned (Coe 2007).

## Cash Investments

A sound cash management policy maximizes idle cash through sound investment practices. Increasing earning potential is very important for not only meeting daily service demands and unexpected revenue shortfalls, but can also present savings opportunities for capital project construction activities. Prior to any investment endeavors, it is important for officials to determine any laws, ordinances, or policies which may restrict specific investments or any type of investment that may appear too unsafe for public funds. It is also important to ensure that investment responsibilities are performed by qualified personnel that are familiar with the securities market while simultaneously understanding the needs of the unit through cash forecasting. As a general rule, securities should be low risk with a stable net asset value per share. If possible, the portfolio should be diversified with securities that have varying maturity dates along with securities that can readily be converted into cash.

The financial position of the unit as well as available cash determines the most appropriate investment. In most cases, the local government investment pool has proven to be one of the most popular and safest options for local governments (Modlin and Stewart 2013). These pools primarily consist of multiple local governments in one state providing a minimum amount of cash for collective investment. Pools can either be state-sponsored, a mixed effort of state and private entities, or managed independently by the participants. In the United States, Standard & Poor's Rating Service provides information concerning pool capacity to maintain principle and limit losses due to credit risk exposure. Pools that are the most stable and can successfully maintain liquidity receive the highest rating of AAAm. Compared to other types of securities, investment pools provide increased flexibility for deposits and withdrawals with little or no penalty for frequent transactions.

Certificates of Deposit (CDs) are bank time deposits with a certificate stating the fixed rate of interest, the dollar amount, and the date of maturity. CDs can be negotiable and nonnegotiable and insured up to $100,000 by the Federal Deposit Insurance Corporation (FDIC) against default. CDs have a maturity range from a week to 12 months and up to 5 years for longer-term CDs. Flexibility is also enhanced if the issuer

allows redemption prior to maturity. Also, the amount of CDs vary considerably at $1,000 on up. Some financial institutions only offer CDs for a specified minimum. Depending on the interest rate and terms of maturity, nonnegotiable CDs can actually have a higher rate of return. Transactions of negotiable CDs can take place in the secondary market, but due to ownership uncertainties and collateralization issues, many local governments prohibit negotiable CD investments. Among smaller local governments, the CD's popularity is equivalent to the investment pool (Modlin and Stewart 2012).

Treasury securities (T-bills, notes, and bonds) are fully guaranteed by the US government and provide local governments the opportunity to increase liquidity upon the maturity date expiration of the security. Treasury bills usually have maturation times of a few days to 6 months with the interest and yield being the difference between the purchase price and the value at maturity. Two series of T-bills that mature in 91 days and 182 days, respectively, are offered on a weekly basis. A major advantage to T-bills is that interest is exempt from state income taxation, but not federal taxes. Treasury notes have longer maturation dates that range from 2, 3, and 5 to 10 years and usually pay interest on a 6-month basis. Unlike the treasury bill, treasury notes are issued with a specific coupon rate and a fixed face amount with coupons ranging from $5000 with longer maturities, usually more than 4 years (Coe 2007). Treasury bonds have the most extensive original maturity (30 years) with a fixed par value and a specified coupon rate of interest. The interest rate for the treasury bond is usually much higher than the T-bill due to the maturity length.

The repurchase agreement (repo) is a service provided by a bank or offered through a securities dealer in which the buyer (local government investor) actually purchases securities from a dealer or bank at market value for a specified period of time with the condition that the bank or securities dealer will repurchase the securities with interest. Repos provide an additional investment alternative that complements the investment pool and other securities. *Overnight* repos are commonly used by local governments and are based on the federal funds rate. *Term* repos offer maturity limits for several time intervals with a fixed interest rate based on the number of days invested. *Open* repos are ongoing relationships between the financial institution and the buyer until one of the parties terminates the agreement. The federal funds rate is usually higher with open repos (Coe 2007). With *reverse* repos, the local government unit owns the securities, and the financial institution or dealer exchanges cash for temporary ownership and the agreement to resell at a specified time. It is recommended that the underlying value of the securities is calculated daily if possible and not decrease below the full value of the repurchase price.

Securities issued by the federal government are agency bonds. There are two types of agency bonds – government-sponsored enterprises (GSEs) and federal government agencies that issue and guarantee these bonds. Bonds issued by GSEs provide credit for different sectors of the economy such as housing (Federal Home Loan Mortgage Corporation) and agriculture (Federal Agricultural Mortgage Corporation). Maturities are shorter and the bonds are not fully backed by the US government. Bond yield is slightly higher compared to US treasury bonds, but there is some credit and default risk. There are a limited number of government agencies that issue securities. Some examples include the Small Business Administration (SBA) and the Government National Mortgage Association (Ginnie Mae). These bonds are backed by the full faith and credit of the US government, but are slightly less liquid than treasury bonds. Securities from government agencies usually have long-term maturity rates that could preclude usefulness depending on government needs.

Additional low-risk investment alternatives include saving certificates, prime quality commercial paper, and bankers' acceptances. However, it is always important to diversify interest due to the changing market and to adhere to state guidelines and recommendations practices. Cash management policies should have goals and objectives which have detailed acceptable investment alternatives.

## Bank Services

It is important for any local government to secure bank services that can accommodate a variety of tasks required for all tasks associated with cash management operations. Government officials should determine every potential need associated with collections, disbursements, and investment practices. Most local governments will solicit bank services through the issuance of request for proposals (RFP) through various media outlets. The RFP will include terms and conditions, mandatory minimum requirements, the listing of core and secondary services of the service provider, timeline, and a pre-proposal conference meeting or other contact information for additional questions. A RFP is not required for the solicitation of bank services, but the practice is increasing (Modlin and Stewart 2012).

The use of multiple banks is usually the preference for larger local governments due to the volume of services and activities. A primary bank is used for ongoing activities such as holding money for payroll, regular payables, and some investment activity. Secondary banks can be utilized to handle transactions for additional units associated with the primary government or even for moving larger revenue sources for debt service purposes. Multiple banks can also be used to determine the best alternative for achieving the highest interest rate depending on the activity. For smaller local governments, especially rural townships, one bank will more than likely be capable of managing the necessary services required. Opportunity does exist for more services and increased interests with larger banks, but potential distance could also cause a loss of jobs outside the jurisdiction.

## Conclusion

Cash management has become a vital function for adequate dissemination of government services, but it is especially critical for local governments. Officials are continually examining the entire process in order to maximize cash amounts. The utilization of multiple bank services enables officials to expedite receivables, accrue interest, and make payables accordingly. The entire process also illustrates the importance of multifaceted personnel that have an increased understanding of services available in comparison to organizational needs. Banks are also increasingly interested in local governments as clients due to the amount of potential cash holdings and the stability of governments as employers. In general, the efficiency in cash management practices is a result of additional demand for more responsible management of public funds.

# Casuistry in Public Organizations

Martin Calkins
University of Massachusetts Boston, Boston, MA, USA

*Casuistry*, derived from the Latin *casus* meaning "case," is an inductive method of moral deliberation that uses previously settled (or resolved)

truth-bearing cases drawn from a case taxonomy in a back-and-forth fashion according to fit. Its objective is the determination of the best overall course of action in a particular and immediate situation.

## Casuistry as a Method

As a method, casuistry has descriptive and normative qualities. On the one hand, it describes the circumstances, motives, behaviors, and values that people use in moral arguments. On the other hand, it provides a normative framework for making moral judgments. From this perspective, users are provided with a framework of ordered cases (a case taxonomy) in which moral judgments have already been rendered. This order is such that each case is placed in a hierarchy according to its ability to convey moral certitude. At the foundation are paradigm cases that convey unambiguous moral certitude. Those that are more ambiguous (or marginal) are arranged in relation to the foundational cases according to their ability to convey moral certainty.

When casuistry is employed in moral problem-solving, cases are withdrawn systematically from the taxonomy according to fit – that is, in terms of the similarity between the present situation and one or more settled cases of the past. Because, however, a present situation rarely mirrors a past event, the casuist must return to the taxonomy to draw from it other more or less related cases for the purpose of gathering convincing material. Using a back-and-forth process of analogy and rebuttal, the casuist draws on cases that closely resemble the current situation. These cases are brought forward to support, nuance, or refute a position, and then they and their attendant judgments are layered upon each other as liqueurs are in a *pousse-café* (a layered cocktail). In this way, just as a glass of various liqueurs delivers a stronger punch than any single ingredient in a drink, so the aggregate of well-arranged settled cases produces a judgment that is multifaceted, practical, defensible, and more potent than any single case or argument used in isolation.

In its reliance upon reasoning by analogy and by drawing exclusively from multiple truth-bearing cases to infer general norms and specific actions, casuistry can be considered an inductive or "bottom-up" approach that begins with particulars and the concrete and proceeds upward to general judgments.

## Casuistry's Tradition

Traditional casuistry can be divided into four general sorts: Greek, Hebrew, Muslim, and Christian. Each of these casuistries reflects the morality of the respective culture or religion, with Christian casuistry being the most pervasive sort that has been parsed into Roman Catholic and Protestant varieties.

An ancient method, Greeks around the time of Plato and Aristotle practiced casuistry as did Muslims prior to the so-called closing of the gates of *ijtihad* in the tenth century that effectively abolished the practice of independent moralizing in favor of "rightful interpreters" – priests and clerics (Arabic: *ulema*) – who took it upon themselves to dictate morals for believers (Wenley argues that ancient Greeks restricted use of casuistry to those larger vital problems that accompanied the need for further definition of the ideal. See (Wenley 1911, 242; Abbas 2004). For more on this aspect of Muslim morality, see (Khare 1999).

There is also a distinct Hebrew casuistry that can be characterized by two main features: the rabbinic influence within the religion and the use of law in Judaism. Jewish casuistry can therefore be said to be the product of that religion's reliance on religious teachers (rabbis) to interpret oral law (Hebrew: *mishnah*) as well as a legal system in which ethical deliberations are heavily rule oriented and more legalistic than those of other religious traditions. Even so, laws here are not applied unquestioningly but, rather, are interpreted and contextualized through the use of casuistic narratives. As a result, the record of the rabbis' decisions in case format along with the narrative-based oral law of Judaism forms the basis of a distinctly Jewish casuistry (it should be noted that post-diaspora Judaism has no official central body or authority figure such as a pope to arbitrate religious tenets). Rabbis

therefore have had a great deal of authority in directing the practice of the faith through their instruction and guiding influence on the interpretation of scripture. Their interpretations of oral law effectively forged Jewish morality and established a trajectory for the religion in practically relevant ways. For more on Jewish law's historical roots, see (Derrett and Duncan 1974; Falk Z′e 1972).

Finally, Christian casuistry, the sort most commonly understood today, similarly grew out of oral practice. Unlike Jewish or Muslim casuistries, the oral tradition of Christian casuistry was tied to auricular confessional practices that emerged in the seventh century when priests began to hear the private confessions of individuals and refer to books that listed various sins and their appropriate penances. Here, casuistry was used to resolve problems related to the Church's authority over the consciences and social behavior (the internal and external forums) of believers (Jonsen and Toulmin 1988, 47, 52–53, 101, and 113–121).

Christian casuistry reached its peak in 1556–1656 – an era that began with the publication of the Augustinian cleric Martin Azpilcueta's *Handbook for Confessors and Penitents* and ended with Blaise Pascal's (1623–1662) *Provincial Letters* – as moralists largely abandoned confessional books in favor of taxonomies based on the Ten Commandments or the Seven Deadly Sins (Jonsen and Toulmin 1988, 142–143, 251). The chief promoters of this transition and casuistry itself were Jesuits – members of the male religious order formally known as the Society of Jesus – who were trained in disputation and logic.

## Casuistry's Slide into Disrepute

During its high point, casuistry came under attack within the Roman Catholic Church as part of a series of highly contentious theological and political disputes. Blaise Pascal's stinging critiques of the Jesuits (his chief adversary) in *The Provincial Letters* (French: *Lettres Provinciales*) were most damaging to casuistry's reputation (Jonsen 1993, 56, 59, and 62–63). Pascal – a loyal Port-Royal Jansenist – attacked the Jesuits and their casuistry on the grounds of equivocation and drawing erroneous moral judgments in a broader attempt to undermine the Jesuits' more participative view of Eucharistic practices (in essence, the Jansenist-Jesuit dispute concerned the role of grace (efficacious and sufficient) in relation to salvation (Pascal, *The Provincial Letters – Letter II January 29, 1656*, 1999b). Pascal's charges – made cleverly through humor – drew widespread public attention that led to papal decrees condemning individual casuists. While the effort was successful in damaging the reputations of the Jesuits and casuistry, Pascal's more exclusionary view of the Eucharist was rejected, and he was unable to "destroy the plausibility of "case analysis" itself as an approach to dealing with moral problems ((Jonsen and Toulmin 1988, 249). See, too, (Jonsen, "Casuistry," 1986a, 79). In the end, Pascal effectively sullied the reputations of the Jesuits and casuistry, but the Jesuits won the theological dispute against the Jansenists by discrediting and disempowering the group and its theology (Pascal's capitulation is stirring. See (Pascal, *The Provincial Letters – Fragment of a Letter XIX Addressed to Father Annat*, 1999a). See also (Jonsen and Toulmin 1988, 231–249).

With the Protestant Reformation, Roman Catholic casuistry came under further attack (Jonsen 1993, 59). Martin Luther, for one, despised the Catholic summists' casuistry because of its elaboration of the distinctions of sin, emphasis on penance, and close association with a theology of works (Jonsen and Toulmin 1988, 157). While charging Roman Catholic casuists with undermining the fundamentals of the faith, Luther nevertheless developed another sort of casuistry, one mediated by pietism (Wenley 1911, 245). Later Reformists went on to expand upon Luther's version, developing other sorts of casuistries that eventually led to a distinct Protestant casuistry (For more on the various forms of casuistry outlined here, see (Calkins 2014, 8–15).

During part of this period, casuistry suffered the growing critiques of post-Enlightenment moral philosophers who considered casuistry to be at odds with and inferior to the analytic and scientific processes being extended from the

physical sciences to the moral realm. Casuistry was viewed as old fashioned, lacking precision, and "too disorganized, cluttered with maxims and definitions and distinctions, and probabilistic and prudential" for serious use (Jonsen 1993, 59). Its methods were seen as too roundabout, antiquated, imprecise, unnecessarily fallible, and inconclusive. Unspoken but far worse, casuistry contained vestiges of religion that modern secular philosophers could not tolerate.

In the end, casuistry came to commonly be known as clever but unsound reasoning and was regularly dismissed in philosophical circles for promoting lax reasoning, sophistry, and equivocation. Even so, casuistry's long enduring and unflattering reputation has been shown to be wrongly attributed to the method per se. As Jonsen and Toulmin have explained, it has been abused rather than determined to be ineffective (Jonsen and Toulmin 1988). Today casuistry remains an excellent approach for describing, dissecting, and nuancing information about people and places so as to reach defensible moral judgments.

## Casuistry and Applied Ethics

The astute reader will recognize by now casuistry's similarity to other ethical approaches. Casuistry shares a number of features with the business case method, for example. It has also been described as a watered-down or incomplete version of reflective equilibrium. While some of the attributes of these other approaches do appear to be similar to casuistry's, a closer inspection and critique has shown them to be fundamentally different (for critiques of the comparisons of reflective equilibrium and the business case method to casuistry, see (Calkins 2001, 2014). For the assertion that casuistry is a watered-down version of reflective equilibrium, see (Sunstein 1993).

Even so, casuistry does share a great deal with one popular approach in the English-speaking world – common law practice (common law is the sort of law practiced in many of the countries that trace their legal heritage to England). In both, there is reliance upon judgments based upon an aggregate of compelling precedent cases, a dialectical back-and-forth method of argumentation, an aggregate of differing perspectives, and a synthesis of judgments.

Casuistry is also not unlike the approach typically used in clinical medicine where past cases of successful and unsuccessful diagnoses are used as legitimate references when making current judgments about the conditions of patients with indeterminate ailments (Arras 1990; Hunter 1989; Johansen 1995; Jonsen, "Casuistry and Clinical Ethics," 1986b, 1991; Tomlinson 1994). This clinical approach has been extended to other areas of applied ethics – in particular, computer ethics, the ethics of journalism, and business ethics (Boeyink 1992; Coleman 2007; McLaren 2006). In some applications such as business ethics, casuistry was simply explored in general and then left undeveloped (Brinkmann and Ims 2004; Ciulla 1994; Drucker 1981; McMahon 1986; Velasquez 1994). With time, however, the method was examined more deeply and shown to be a valuable moral decision-making tool, especially when twinned with virtue ethics (Calkins 2001, 2002, 2014).

## Examples of Casuistry Applied

In all of its applications, casuistry has helped people grapple with current vexing moral problems. It has enabled users to figure out, for example, how to deal with the ethics of an HIV medication needed by an impoverished population that cannot afford costly drugs by bringing forward prior cases such as Merck and Co.'s decision to freely distribute ivermectin to combat river blindness and Johnson & Johnson's decision to set aside profit concerns when pulling a tainted product off the shelves during the Tylenol Crisis. In both of these precedent cases, we see how private firms worked with public institutions to promote society's betterment. In the Merck case, a company worked with the public health arm of the United Nations to distribute a drug in outlying tropical settings to prevent river blindness. In the J&J case, a private firm took a popular product off the shelf at significant cost to itself to protect the public against a possibly tainted product (Calkins

2014, 317–319). For details about the Merck & Co. river blindness case, see (Reporter 1987, 78; Hanson and Weiss 1991; Donaldson and Werhane 1999, 148–153; Cavanagh 1998, 235–236). For the Johnson & Johnson Tylenol case, see (Buchholz 1989, 212–232; Cavanagh 1998, 237–238; De George 1999, 3–5).

Today, casuistry would likely be helpful in breaking the ideological stalemates associated with the ongoing health-care debate in America. Because casuistry's case-based orientation focuses on the practical details that ordinary people face, casuistry serves to sideline ideology and political-driven arguments, principle and law-based discussions, and top-down decision-making. Jonsen and Toulmin have illustrated this phenomenon with their example of a 1974 meeting with the National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research, where casuistry's concentration on practical conclusions enabled those who could not agree on the reasons or principles underlying issues to successfully focus instead upon practical recommendations (Jonsen and Toulmin 1988, 16–19). Albert Jonsen and Stephen Toulmin describe the debate within the 1974 US Congressional National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research as follows:

> The eleven commissioners had varied backgrounds and interests. They included men and women; blacks and whites; Catholics, Protestants, Jews, and atheists; medical scientists and behaviorists psychologists; philosophers; lawyers; theologians; and public interest representatives. In all, five commissioners had scientific interests and six did not; and before they started work, few onlookers expected them to have much basis for agreement, either about general moral principles or about the application of these principles to particular problems. On hearing the composition of the commission one respected commentator reportedly said, "Now we shall presumably see matters of eternal principle decided by a six-to-five vote!" All the same, things never worked out that way in practice. At no time in its activities did the commission's opinion divide cleanly along a line between scientists and laypeople; nor did the other differences of background have anything resembling their expected effect on the practical discussions. Quite the contrary: so long as the commissioners stayed on the taxonomic or casuistical level, they usually agreed in their practical conclusions. (Jonsen and Toulmin 1988, 17).

In both situations, casuistry would allow individuals to get around insurmountable foundational epistemological problems to reach defensible and operational judgments.

To illustrate, had a casuistic approach been taken in the framing of the Patient Protection and Affordable Care Act, there likely would have been less bipartisan rancor in the bill's formation and a more favorable and defensible outcome (Patient Protection and Affordable Care Act (PPACA), also known as the Affordable Care Act (ACA) and Obamacare). Tennessee's TennCare and Maine's Dirigo Care, to name just two precedent state-based cases, might have been brought in to frame the conversation and legislative process prior the federal health-care bill's approval. Had TennCare (instituted in 1994) been considered, it would have been shown to have so burdened Tennessee's budget with uncontrolled costs that by 2004 healthcare accounted for a quarter of that state's appropriations. By then (a full 7 years before ACA), the situation had gotten so bad that Governor Phil Bredesen announced, "I have set in motion a process to dissolve TennCare and replace it with a traditional Medicaid program" (Ku and Wachino 2004). Faced with onerous cost overruns, the governor asked in 2005 for a $272 M budget increase with half earmarked for TennCare (Nashville Business Journal 2005). Despite this infusion of funds, however, Bredesen faced the prospect of state bankruptcy and threw 170,000 adults out of the state health-care program, considering later that doing so was his largest mistake during his time as governor and blaming advocates for the poor for refusing to deal with him on reducing benefits for a program that was absorbing future tax growth and causing reductions of other state-supported programs (Sher 2010). As late as 2010, the subsequent Tennessee governor continued to struggle with health-care costs and ways to cover the losses attributable to them (Wilemon 2010).

In hindsight, even the state of Tennessee would have done well to take notice of the warning signs associated with another state's experience – Maine's experiment with a state-sponsored universal health-care program known as Dirigo Care (Bragdon 2005; Miller and Rosman 2004). Established in 2003, Dirigo Care presented

Maine with $155 million in added costs and dwindling program enrollments soon after its implementation such that by 2009, only 9,600 individuals remained covered by the plan (Suderman 2010). Trish Riley, the principal architect of Dirigo Health Reform, suggested ways to redeem the program (Riley 2013). After 10 years of compromise, however, the program was disbanded with, as Maine Legislature's Insurance and Financial Services Committee member Jonathan McKane noted, few real long-term goals achieved and plenty of hard lessons learned (McKane (2014). The Tennessee and Maine cases would seem to caution other states such as Massachusetts against similar costly universal state-sponsored health-care programs. Such was not the case, however, as Governor Mitt Romney instituted a health-care law in 2006 that incurred costs that precipitated cuts to state funding for transportation, public safety, and education (Editor 2013; Suderman 2010). Even now, more than 10 years later, the Commonwealth has a significant budget deficit).

With these precedent state-based cases as well as cases involving other sovereign nations as cautions, it would have been prudent to use a casuistic approach when discussing changes to federal health-care policy. Prudence, however, did not hold forth, and instead ideology and political obstinacy took hold with the result being poorly conceived legislation, an unattractive set of health-care offerings, and an escalation of government spending that contributed significantly to America's nearly 20 trillion dollars of public debt and an overturn of government (The Bureau of Fiscal Service (2017). The ACA's lack of financial stability is noted by the boards of trustees of the federal hospital insurance and federal supplementary medical insurance trust funds that report that "current-law projections indicate that Medicare still faces a substantial financial shortfall that will need to be addressed with further legislation" (Boards of Trustees of the Federal Hospital Insurance and Federal Supplemental Medical Insurance Trust Funds 2016, 4). See, too, (Office of Management and Budget 2016, 21).

While the health-care debacle in America case might be construed as nothing more than bad policy making, its waste of resources and the implementation of physical and financial burdens on the citizenry make it ethical in nature as well. A casuistic approach would have sidestepped rancorous ideology-driven discussions and led to a more thoughtfully considered, practical, and morally defensible outcome.

In sum, we have seen here how casuistry is a helpful inductive method of moral deliberation that leads to the establishment of expedient moral judgments in real settings and how casuistry's judgments are practical and defensible in various venues, including public organizations and the formation of public policy.

## Cause-Related Marketing

Cindy L. Pressley
Stephen F. Austin State University, Nacogdoches, TX, USA

### Synonyms

Cause marketing; Consumer-oriented giving; Social responsibility marketing; Societal marketing; Strategic philanthropy

### Definition

Cause marketing is a strategy that develops a mutually beneficial relationship between a firm and a nonprofit organization that involves a consumer transaction wherein the firm will provide some form of donation to the nonprofit organization as a result of the transaction.

### Introduction

It has become commonplace to see purchasable products that offer some connection to a cause or nonprofit organization. You might purchase a box of cereal and have the opportunity to mail in a portion of the box top which would provide funds for after-school programs for at-risk youth. You might purchase a scarf at a department store where a percentage of the proceeds from the purchase would be sent to a nonprofit organization fighting against heart disease. You might buy a cup of coffee, and a certain amount of the purchase price would be given to a nonprofit organization dealing with sustainable farming. These are examples of cause-related marketing. The key with cause-related marketing is that there is a consumer transaction that should benefit both the firm selling the product and the cause associated with that product. The donation to the nonprofit organization is connected to the consumer transaction made in favor of the firm's product. Cause marketing is a strategy that should be built into the overall marketing strategy of the firm and the nonprofit organization. The basic idea behind the strategy is to connect economic goals with societal goals.

There has been an increase in the use and resources devoted to cause-related marketing since the early 1990s (Bennett 2002). Cone Communications, a research firm established in the United States, has conducted consumer research on cause-related marketing since 1993 which has been heavily referenced in studies conducted on cause-related marketing. The 2010 Cone Cause Evolution Study found that 41% of Americans purchased a product that was cause related in the past year, a figure double that of the original 1993 study of 20%. The study also showed that 83% of consumers wanted more cause-related products, with similar numbers for consumers who saw increased firm/brand image when a product was cause related (85%) and for consumers who would switch brands when price and quality are similar and the product was cause related (80%). Public interest in cause-related marketing has been supported by longitudinal research (Cone LLC 2010).

### Development of Cause-Related Marketing

One of the earliest recognizable uses of cause-related marketing on a national scale was by credit

card company American Express in connection with the Statue of Liberty Foundation for the renovation of the statue in 1983. American Express developed a cause marketing campaign whereby every time their card was used, American Express would donate a penny to the foundation and when a new card was opened, they would donate one dollar to the foundation. The campaign was seen as a success in that the Statue of Liberty Foundation received over $1 million in donations and American Express saw an increase in both use of its credit cards and in new applications for credit cards. Since this time, cause-related marketing has grown rapidly and has been used by a range of firms and nonprofit organizations.

Cause marketing was originally seen as a way to differentiate firm brands from one another by breaking through the slew of advertising directed at consumers and as a way to improve the image of the firm and its brand (Liston-Heyes and Liu 2010). It is essential to note that cause-related marketing needs to provide benefits for the firm particularly in terms of increased sales and profit. While benefits accrue to both the firm and the nonprofit organization, the benefit is often viewed primarily in favor of the firm. The firm connects with the nonprofit organization in order to garner ethical good will among customers and employees. This may allow a firm to improve its image among a group of stakeholders without making internal changes to the firm or brand. The range of benefits to the firm is thus rather broad. For the nonprofit organization, they can gain visibility and awareness for their cause as well as potential new avenues of funding. The consumer, who is considered an additional stakeholder in cause-related marketing, gets to determine through their consumer choice the level of importance of support for a particular cause. In addition, the consumer may feel that their purchase has added personal and societal value due to the connection to the cause.

A debate exists regarding cause-related marketing as to whether it is just another form of corporate philanthropy. It was originally considered as such by a seminal article on cause-related marketing by Varadarajan and Menon (1988) where cause-related marketing was seen as a form of giving motivated by profit. Varadarajan and Menon note that cause-related marketing focuses on improving performance for the firm while at the same time helping a cause. However, corporate philanthropy is not based on a transaction approach and does not seek to impact consumer behavior such that cause-related marketing could be distinguished from philanthropy. This particular debate has not been settled in the literature (Gupta and Pirsch 2006).

## Benefits and Concerns of Cause-Related Marketing

A range of benefits can be accrued by the firm and the nonprofit organization who engage in cause-related marketing. Firms may receive the broadest range of benefits of any of the three stakeholder groups. Benefits to the firm can include increases in sales, product and firm visibility, customer loyalty, employee morale, and improved firm and brand image. Firms may be able to get around advertising clutter, make faster entry into a market segment, and potentially increase support for other firm brands which can provide for increased consumer choice in favor of the firm with intent to purchase. A firm may also be able to counter negative publicity it has garnered under prior circumstances.

The nonprofit organization engaged in cause-related marketing may have a smaller range of benefits accrued as compared to the firm; however, the benefits may continue to be worthy of the effort as they include the creation of additional funding streams, promoting direct contributions, becoming more marketing efficient, and increasing public awareness for the nonprofit organization and cause.

While the benefits of cause-related marketing for both the firm and nonprofit organization make it a fairly sound marketing strategy, there are a number of potential concerns surrounding the use of cause-related marketing that both the firm and nonprofit organization should be aware of.

Concerns for the firm include the financial risk involved with using portions of funds that would go toward traditional marketing tactics to cause-related marketing and the possibility of the image of the firm being tarnished by consumers seeing

the cause-related marketing as too controversial and as exploitative of the nonprofit organization where the nonprofit organization benefits little as compared to the benefits received by the firm. The concern of an exploitative relationship is especially critical for the firm where the consumer views cause-related marketing not as a strategy for giving to a social cause but rather as a strategy meant for firms to simply increase profit and thus the relationship between the firm and nonprofit organization is not considered genuine but is instead regarded as exploitative (Gupta and Pirsch 2006). When seen as exploitative, both firm and nonprofit image can be damaged, whereas if the firm is seen as providing genuine support for the cause or nonprofit organization, consumers evaluate the initiative in a more positive light.

General criticisms of cause-related marketing that may be recognized by the consumer and may raise concerns for the firm involved include that the firm may spend more on the cause-related marketing campaign than is given in donations to the nonprofit organization and that by having charitable giving made tax deductible that firms are able to have part of their marketing strategy subsidized by government.

Concerns for the nonprofit organization include the potential risk of being seen as commercialized due to the connection to the firm which could tarnish the image of the nonprofit organization as they are seen as allowing their cause or organization to be exploited and the funds received from the cause-related marketing campaign may be considered a substitute by consumers and firms such that consumers and firms provide less donations by other means.

## Mechanics of Cause-Related Marketing

In order for a cause-related marketing campaign to be successful, it must be planned out and executed by taking into account particular considerations. Not all cause-related marketing campaigns are successful. Issues such as donation form and amount, partnership fit, target audience, duration, region of promotion, and means of evaluation are essential to consider.

There are various methods by which to engage in cause-related marketing. The donation can be formulated in a number of ways including (a) a stated amount per purchase which is often seen as most positive and trustworthy in the eyes of the consumer audience, (b) a percentage of the sale amount per purchase, and (c) a percentage of the profit per purchase or can involve some other type of transaction such as consumer redemption of a cents-off coupon and the firm sending donations to the nonprofit. Firms can set a limit on how much total they will donate or can leave the amount open. It should be noted that when it is a vague amount or percentage where the firm simply states it will make a donation, this is generally seen as less positive by consumers. In addition, the size of the donation may be more of a factor for consumers than which format is used to provide the donation where smaller donations are seen with less trust and larger donations could impact consumer choice such as by the consumer choosing to switch brands based on the donation size (Human and Terblanche 2012).

There should be a connection between the product and the cause to make the cause-related marketing campaign more effective and appealing to consumers (Basil and Herr 2003). Cause marketing creates a type of relationship between the firm and the nonprofit organization. If the fit between the firm and the cause is strong, it can aid in increasing the firm brand value. A weak fit can damage not only the image of the firm but of the nonprofit organization as well. Finding fit between the customer profiles of both the firm and the nonprofit organization is a useful way to examine fit in addition to examining the fit with the product and markets. A firm may choose a single cause or multiple causes with which to connect.

An example of good fit can be seen with the "Pedigree Adoption Drive" which began in 2008 by pet food company Pedigree. The program had multiple components including raising issue awareness and encouraging individuals to adopt dogs from animal shelters. The primary financial mechanism was that Pedigree would donate to animal rescue charities for each product sold. The program was advertised in numerous ways including television, program-specific website,

social media, and marketing on products themselves. The program increased sales of Pedigree products as well as brand equity and led to $790,000 in donations from the sale of dog food products in 2008. Pedigree has since increased their cause-related marketing campaigns in addition to establishing the Pedigree Foundation in the year 2000. The firm found a successful and strong fit by connecting its product and firm brand with the profiles of its customers, those who own and have an affinity for pets.

With most marketing, it is important to know your target consumer audience of both the product and the nonprofit organization. For example, some studies have shown distinctions in consumer choice in Western and Eastern countries with consumers in Western countries preferring cause-related marketing with luxury products and those in Eastern countries with utilitarian products (Gupta and Pirsch 2006). Research indicates that women tend to be more open to cause-related marketing than men (Gupta and Pirsch 2006). The 2010 Cone Cause Evolution Study found that mothers and those of the millennial generation are more open to cause-related marketing than other groups. Human and Terblanche (2012) explain that the millennial generation has a community orientation and is seen as supportive of causes; however, they are inundated with web-based and social media announcements and charitable requests and so may not be able to differentiate between causes and nonprofit organizations and may get compassion fatigue. This is important for firms and nonprofit organizations to recognize when determining who their target audience is and how they should advertise and target that particular audience.

Other issues to consider include whether the cause marketing campaign is a short-term or long-term commitment within the overall marketing strategy. Questions include whether the campaign will end at a particular time or whether it is ongoing and how strongly will the campaign be advertised. Research suggests that consumers often prefer causes linked to disaster relief more so than continuous programs (Husted and Whitehouse Jr 2002). If the firm and nonprofit organization are able to develop a close working relationship, then the ability to develop a long-term relationship can aid with public relations for the firm and the nonprofit organization (Varadarajan and Menon 1988). Cause marketing should link the firm's brand and the cause issue in the mind of the consumer. The concern with a short-term campaign is that it can be seen as opportunistic, so the growth of more long-term campaigns has emerged.

Cause marketing can be conducted at local, regional, national, or global levels. For firms with a national reach, a national cause-related marketing campaign may be effective; however, research indicates that consumers tend to prefer local over national causes (Gupta and Pirsch 2006).

A concern for cause-related marketing is how to evaluate and determine the campaign's effectiveness (Varadarajan and Menon 1988). One argument focuses on evaluation based on revenue for the firm; however, other arguments focus on the need to expand how cause-related marketing is evaluated such as the good will brought to the firm and visibility brought to the nonprofit organization, essentially focusing the evaluation of effectiveness on intangible benefits. The mode of evaluation may depend on how managerial behavior is guided within the firm involved in that if behavior is guided by giving to society, then profit may not be the main evaluative criteria, but if charitable giving is expected to provide a return, then profit may be the main criteria used by the firm to evaluate the cause-related marketing campaign's effectiveness (Varadarajan and Menon 1988).

## Breast Cancer Causes as Long-Term Successful Cause-Related Marketing

One of the most successful cause-related marketing campaigns revolves around the issue of breast cancer, most notably involving the nonprofit organization the Susan G. Komen Breast Cancer Foundation. An examination of cause-related marketing from its inception and development over several decades can be found in the area of breast cancer. King (2006) provides an in-depth

examination of the breast cancer cause movement and a study of cause-related marketing in her text *Pink Ribbons, Inc*.

Founder of the Susan G. Komen Breast Cancer Foundation, Nancy Brinker, is considered a pioneer in the area of cause-related marketing due to the multiple corporate connections and partnerships that have developed with the Komen Foundation. The growth of breast cancer as a favorite issue can be linked to the convergence between political organizations, nonprofit organizations, and firms such as pharmaceutical and cosmetic firms who can be seen as tying in with the same group of stakeholders as breast cancer focused nonprofit organizations, state, and media action (King 2006). The development of the movement for the fight against breast cancer can be seen as corporate and consumer driven where breast cancer is considered a favorite issue of many firms when engaging in cause-related marketing campaigns.

The most ubiquitous illustration of a widespread cause-related marketing campaign can be seen in the use of colored ribbons being placed on consumer objects. The pink ribbon is now synonymous with breast cancer causes. It can be seen as representing the close connections between firms and nonprofit organizations as well as the focus on the primary target audience of much cause-related marketing, women. Charity becomes a lifestyle choice through consumer actions and has become a profitable marketing strategy for numerous firms. The success of breast cancer cause-related marketing campaigns can be seen as a way to motivate firms to take on more forms of cause-related marketing (King 2006).

Breast cancer cause-related marketing provides an example of a cause-related campaign that focused on attempts at improving the image of an organization, specifically the American National Football League's "Real Men Wear Pink" campaign where the use of various mechanisms of breast cancer cause-related marketing was put into place to repair negative images and publicity garnered by NFL players as well as to expand the market into a broader female audience.

The growth of cause-related marketing campaigns does have some criticisms. Breast cancer-related campaigns have been no exception and have been criticized by a number of groups including some nonprofit organizations associated with the cause itself. This connects with the idea of exploitation of the cause for the purpose of making a profit. For example, the nonprofit organization Breast Cancer Action created a campaign called "Think Before You Pink" that asks consumers to examine their consumer actions and consider how much is being raised in donations through the cause-related marketing campaign as compared to how much publicity and profit the firms garner through such campaigns (King 2006). Breast cancer is also an example of a cause that no longer helps to distinguish one brand from another in the advertising arena due to its prevalence as a cause in marketing campaigns.

Breast cancer-related marketing has occurred not only in the United States but has been used in countries across the globe. In the year 2000, the Komen Foundation opened chapters in other countries including Germany and Italy. Beginning in the early 2000s, firms also began to attempt to repeat their breast cancer cause-related marketing success in the United States in other countries. For example, Avon cosmetic firm, which started using breast cancer cause-related marketing in the United States in 1993, began a global campaign in 2004. Multinational firms see the potential for increasing market entry and better relations when engaging in global cause-related marketing programs (King 2006). Companies such as Avon have been able to adapt their campaigns to local markets in multiple countries while also attempting to create a global branding strategy, for example, the use of pink ribbon jewelry has been sold in multiple countries, while the particular form and style of jewelry is adapted to fit the country's market. A concern with such global campaigns however is that while the cause-related marketing campaign may prove successful in raising awareness of the issue of breast cancer, it may be seen as exploiting a cause popular in one country for profit purposes in lieu of focusing on causes that have more of an impact in the country

the campaign is being promoted in (King 2006). Essentially, the concern is that by taking a popular and successful cause-related marketing campaign in one country and using it in another country as it is seen as profitable due to its ability to connect with particular societal roles, here womanhood and femininity, rather than focusing on a cause for societal and ethical purposes, expose the role of cause-related marketing as an economic rather than philanthropic activity.

## Conclusion

Cause marketing can be considered a form of strategic philanthropy in that it makes a connection between philanthropy and profit in an efficient way. Cause marketing can also be referred to as a strategic marketing tool. However, for the marketing sector, it is seen as a marketing strategy not as philanthropy and is connected with the change in overall consumer attitudes where consumers want to see social value and meaning added to their consumer lives and are seeing firms as needing to be more ethically and socially conscious. Cause marketing allows donations to be seen as consumer oriented giving used to address social problems. The question remains however as to whether cause-related marketing is creating a form of ethical capitalism or is being used to exploit nonprofit organizations and causes for profit driven purposes.

There is a need for continued research into cause-related marketing most notably in the areas of evaluation and effectiveness. Some research has provided conflicting thoughts on issues such as brand switching where cause-related marketing may increase a consumer's attitude toward a firm's brand but may not convince a consumer to switch brands by itself. This type of behavioral research could be expanded (Hoek and Gendall 2008).

Overall, cause-related marketing has provided nonprofit organizations with new avenues of funding and new methods by which to increase cause awareness. Firms may receive a wide range of benefits from cause-related marketing including increased sales, positive brand image, and corporate good will perceived by consumers. Consumers are able to use their purchasing power to add social value to their purchase. Cause marketing, if implemented correctly by focusing on issues such as firm-nonprofit fit and target audience, may prove a successful part of the overall marketing strategy for both the nonprofit organization and the firm.

# Causes and Consequences of Crisis

Steven G. Koven
Department of Urban and Public Affairs, University of Louisville, Louisville, KY, USA

## Synonyms

Adversity; Danger; Emergency; Tragedy; Tribulation; Urgent situation

## Definition

Causes of crisis refer to precipitating events that trigger the perception of danger. These triggers are interpreted within specific social contexts.

## Introduction

Crises are grounded in both objective fact and social constructs. In the social sciences, endemic problems periodically rise to the level of what we characterize as "crisis." This elevation occurs when a precipitating event activates opinion leaders and subsequently gains attention in the general population. "Triggers" often serve as a crystallizing event that focuses attention on endemic problems. For example, mass shootings of school children may increase knowledge of the number of guns in American society, crimes by foreigners may give rise to the perception of masses of dangerous immigrants streaming over unprotected borders, violent weather may beget concern over climate change, banking failures may precipitate fear of economic peril, wealth concentration may stimulate discussion about economic injustice, and televised shootings of citizens by police may generate fears of unaccountable officers. Triggering events in turn serve as opportunities for policy entrepreneurs to promote chosen agendas.

Causes and consequences of crises can be placed on a continuum ranging from objective to subjective. Causes of so-called "Acts of God"-type crises (e.g., tsunamis) can be technically described and linked to naturally occurring phenomenon such as below ocean floor earthquakes, or a volcanic eruption. Hurricanes can be attributed to temperatures in the water and atmosphere. Consequences of these crises can be evaluated quantitatively by adding costs, such as those associated with property damage or loss of life.

Qualitatively different than these types of crises are those linked to endemic social problem such as poverty, injustice, drug abuse, crime, blocked opportunity, broken homes, and failing school systems. Causes of these socially defined crises are more speculative than "Act of God" crises that possess specific beginning and end points. Social problem types of crises are highly influenced by symbolism and imagery surrounding endemic problems. Image creation and symbolism has been widely recognized as playing a significant role in public policy (Edelman 1964). This role applies especially to socially grounded crises.

The perceived crisis of improper police behavior is reviewed in this chapter as an example of how high-profile triggering events elevate longstanding problems to the status of crisis. The chapter will discuss crisis from the perspective of image creation and the role of the media in molding such perceptions. The chapter contends that in order to secure the imprimatur of "crisis," events must be coupled with widespread attention and emotionally laden imagery.

## Social Construction of Reality

Individuals, groups, and societies place interpretations upon reality that may or may not be true in the absolute sense (Berger and Luckmann 1967; Rochefort and Cobb 1994, p. 5). These interpretations apply to social constructs such as crisis, a term that is subject to interpretation yet generally refers to danger and instability. Criteria to identify a threshold of when danger or instability reaches the "crisis" stage are, however, elusive due to the fact that different actors embrace different values

and interpret specific sets of behavior differently. Categorizations of events as crises therefore represent a confluence of "real" phenomenon with the somewhat subjective interpretation of those events.

"Causes" of crisis may be perceived as post hoc explanations of pervasive conditions. Conditions periodically capture the attention of agenda setters and become a focus of media attention. Focusing events are needed to crystallize problems, and simple slogans are generated to frame behavior. For example, the 2014 shooting of Michael Brown in Ferguson, Missouri, and the "Hands up Don't Shoot" mantra became a rallying cry against improper police behavior. Similarly protestors denounced the 2014 choking of Eric Garner in New York City; the slogan "I Can't Breathe" subsequently gained traction. In 2013, the hashtag #Black Lives Matter gained popularity after the acquittal of George Zimmerman in the shooting death of Trayvon Martin. Black Lives Matter became nationally recognized for street demonstrations following the deaths of Michael Brown and Eric Garner. These slogans fueled a perception of "crisis" in the American justice system and more specifically in methods of policing throughout the nation.

Inquiry into police behavior accelerated with the Brown and Garner deaths. Rioting commenced in Baltimore, Maryland, in April 2015 following the death of Freddie Gray, a 25-year-old African-American resident of Baltimore who appeared to be in good health at the time of his arrest by police. Gray sustained injuries to his neck and spine while in transport in a police vehicle. Protests began after Gray's funeral. These protests produced police injuries, numerous arrests, business damage, fires, and looting. Thousands of police and Maryland Army National Guard troops were deployed in response to the protests and a state of emergency was declared.

The Michael Brown and Freddie Gray incidents illustrate how "triggering mechanisms" can convert nagging conditions into pressing demands for change. Triggers helped to craft images of reckless police attacking powerless citizens. Schneider and Ingram (1993) describe how such images influence public policy. According to these authors, groups are characterized/framed in either positive or negative terms. Characterizations in turn have a powerful influence on policy makers. Policy makers are pressured to extend benefits to positively constructed target populations and to punish negatively constructed groups. Image construction therefore is perceived as a never-ending struggle over imagery with real consequences. Citizens shot by police might be perceived sympathetically as helpless victims of out of control law enforcers; they also may be perceived negatively as threats to legitimate authority. Police may be perceived alternatively as protectors against anarchy or as oppressors of the innocent.

Social constructions were not limited to the police. The 2011 slogan "We are the 99%" became synonymous with income and wealth inequality in the United States. The concentration of wealth among the top earning 1% was decried. The Occupy Wall Street movement focused attention on social and economic greed, corruption, and the perceived undue influence of corporations. The occupation of Zuccotti Park, located in New York's financial district, received global attention. Similarly, Donald Trump's "Make American Great Again" 2015 slogan resonated with disaffected citizens. Trump's slogan harkened back to Ronald Reagan who used the slogan in his 1980 campaign when he promised to cure the nation's economic ills as well as restore America's international standing. Where President Jimmy Carter constructed images of "malaise" among the American people, Reagan promised to reconstruct an image of American greatness. As Reagan demonstrated, imagery is not policy neutral but anoints specific winners and loser.

## Winners and Losers in Image Construction of Crises

Perceptions can either place problems on the back burner or elevate them to a level of danger where they demand action. If the latter is the case resources are allocated, legislation is enacted, people are fired, others hired, and organizational cultures are transformed. "Policy windows" open

if the political climate is changed due to an adjustment in sentiment (Kingdon 2011). Suddenly policy prescriptions that were "nonstarters" under one political landscape become tenable. Winners and losers emerge. The spotlight of the media discredits a group of actors and elevates another. Some groups can be empowered; others may have responsibilities restrained. For example, perceptions of police abuse can lead to changes in recruitment, adjustments in political leadership, alterations in training of police forces, more intense monitoring of police behavior, or other changes. This may have the effect of improving citizen-police relations and may result in fewer deaths of both officers and suspects. Trust in governing institutions can be enhanced and the perception of crisis can be repudiated.

Change, however, is always difficult especially if it is framed as a zero-sum game with clear winners and losers. Police may view any attempt to monitor their activity as an infringement on their prerogatives; any restraints and oversight imposed on them can be perceived as unnecessarily increasing their danger. Citizens may view failure to punish law officers as systemic ratification of illegal behavior, depriving citizens of constitutional protections, and exposing them to the injurious whims of lawless police. A crisis of police abuse then can mutate into a crisis of trust and legitimacy.

The media undoubtedly plays a role in image construction and perception creation. The media can elevate pervasive problems to the level of crisis, or they can choose to ignore issues. Problems such as police abuse, high school dropout rates, obesity, gun violence, wage inequality, immigration, and others may rise or fall in perceived salience depending on media decisions to cover or ignore stories. The role of the press therefore warrants further exploration as a major actor in the creation of socially grounded crises.

## Media Attention: Creating the Mind-set of Crisis

In 2012 a firestorm of media attention surrounded the shooting of teenager Trayvon Martin at the hands of neighborhood watch volunteer George Zimmerman. Further deaths of unarmed African-American youth followed throughout the nation. High-profile cases occurred in Ferguson, Missouri (Michael Brown), New York City (Eric Garner), Cleveland, Ohio (Tamir Rice), Baltimore, Maryland (Freddie Gray), North Charleston, South Carolina (Walter Scott), Waller County, Texas (Sandra Bland), and Cincinnati, Ohio (Samuel DuBose).

Eric Garner died after a chokehold was applied by a New York City police officer. Garner was being arrested on the suspicion of selling untaxed single cigarettes or "loosies." Brown was shot after suspicion of robbing a convenience store. Twelve-year old Rice was shot in a city park after allegedly pointing a pellet gun replica at passersby. Scott was shot in the back by a South Carolina police officer while fleeing from a traffic stop. Freddie Gray fell into a coma and later died after he was arrested and transported by police. Bland was pulled over by police for a traffic infraction, arrested, and later found dead in her jail cell. DuBose was shot by a University of Cincinnati police officer during a traffic stop when he failed to step out of his vehicle. Media coverage of Trayvon Martin and Freddie Gray received the most intense coverage.

## Trayvon Martin Coverage: Sanford, Florida

On February 26, 2012, Trayvon Martin, a 17-year-old African-American, was fatally shot by a community watch volunteer George Zimmerman in Sanford, Florida. Upon returning from a convenience store, Martin was spotted and reported to the Sanford Police. Zimmerman followed Martin on foot, engaged Martin in an altercation, and shot Martin in the chest. Zimmerman was not charged at the time of the shooting; the Sanford Police stated that there was no evidence to refute his claim of self-defense. Zimmerman was later charged with second-degree murder and manslaughter. A jury acquitted him of both charges in July 2013.

The Martin shooting and trial generated a firestorm of media attention. According to the Pew Research Center, the Trayvon Martin incident received the highest level of sustained coverage for a story with a major racial component for the period January 2007 to May 2012. The case became the number one story in the mainstream press the week of March 19–25, 2012. It accounted for 19% of the space in print, online, on radio, and on television. The shooting became the first story in 2012 to generate more coverage in a single week than the 2012 presidential campaign (Anderson 2013).

In terms of image construction many in the media portrayed Zimmerman as a neighborhood watch "wannabe cop" that racially profiled and ultimately killed an unarmed, black teenager. The storyline was amplified by a photo of a young Trayvon Martin and a mug shot of George Zimmerman from a previous arrest. Critics of the media argued that there was more to the story than that of a frustrated would-be law enforcement officer gunning down a helpless child.

Attention given to the Trayvon Martin case opened a policy window for change. Rallies, marches, and protests were held across the nation. In March 2012, students at Martin's high school held a walkout. An online petition calling for a full investigation and prosecution of Zimmerman garnered more than two million signatures. A national debate about racial profiling and stand-your-ground laws was initiated; the governor of Florida appointed a task force to examine the state's self-defense laws.

Actions that followed the 2012 Trayvon Martin shooting support the view that policy "windows" do not stay open for long. In February of 2015, the Justice Department closed its investigation of the shooting without filing hate-crime charges against Zimmerman. After interviewing 75 witnesses, reviewing the material gathered by the state of Florida, and examining prior encounters between Zimmerman and police, federal investigators concluded that there was not enough evidence to prove that Trayvon Martin's death was racially motivated (Alvarez 2015). In 2012 Florida Governor Rick Scott appointed a task force to review the state's "stand-your-ground" law. In 2013 the task force recommended that the state's controversial law not be overturned.

Researchers from the MIT Center for Civic Media concluded that news coverage about the killing of Trayvon Martin started as a short-lived, local news piece. Through traditional and nontraditional broadcast media, the Martin shooting eventually became the most widely covered story with a strong racial component in 5 years. The MIT researchers speculated that television and radio media was powerful in advancing racial issues in the national conversation. The researchers also observed that creating news icons out of selective deaths enabled journalists to write about controversial issues. Researchers contended that television may also be inclined to continue to cover a story it has already introduced. They noted that major news outlets may be susceptible to activists who have an interest in framing controversies (Graeff et al. 2014).

## Freddie Gray Coverage: Baltimore, Maryland

Freddie Gray, Jr., a 25-year-old African-American man, was arrested on April 12, 2015, by Baltimore police officers for possessing a switchblade knife. Bystanders captured the arrest on video recordings showing Gray being dragged to a police van by officers and then stepping up into the van. Official reports note that during the police transport Gray fell into a coma and was taken to a trauma center. According to Gray's family attorney, in the following week, he remained in a coma, suffered from cardiopulmonary arrest, was resuscitated without regaining consciousness, and underwent extensive surgery in an effort to save his life. His family reported that he suffered from three fractured vertebrae, injuries to his voice box, and the sorts of injuries that doctors say are usually caused by serious car accidents. Police confirmed that the spinal injury led to his death; he died 1 week after his arrest.

The Gray incident did not appear to be an anomaly. It was estimated that at least 400 people died every year while being arrested (Graham 2015). On May 1, 2015, the Baltimore Attorney Marilyn

Mosby announced that her office had filed charges against six police officers on the grounds that Gray died as a result of a "rough ride" where a victim is thrown around the interior of a police vehicle by abrupt police driving. Rough rides had been implicated in other deaths and spinal injuries. Protests and civil disorder followed Gray's death on April 27, 2015. The Gray incident continued to generate news well after his death. In December 2015, a judge declared a mistrial in the case against one of the six police officers. The Gray family expressed hope that the officer would be retried and convicted. By July of 2016, either charges were dropped or officers were acquitted in all six of the police officer cases.

Media coverage of the Freddie Gray arrest and subsequent unrest in Baltimore came under scrutiny. Baltimore's City Council President Jack Young was critical of the focus on "negativity" in the city of Baltimore rather than the "great things" that were happening (Zurawick 2015). Young claimed that the media paid inadequate attention to the young people who were protesting peacefully. He asserted that too much attention was focused on burning buildings and rioting. President Obama in a news conference noted that the network and cable television cameras only come to a place like Baltimore when there's violence. Obama observed that images of destruction are hyped; pictures of one burning building are looped on television over and over and over again, yet the thousands of peaceful demonstrators get lost in the discussion. In contrast some Baltimore residents praised the attention given to US Rep. Elijah E. Cummings who walked the streets of the city trying to get protesters to honor the curfew (Zurawick 2015).

## Conclusions

Precise causes and consequences of crises are difficult to isolate. In regard to natural disasters, objective determinants of causes can be cited with some degree of confidence. In the realm of "social disasters" (e.g., illiteracy, poverty, disregard for human rights, crime waves, poor educations, deprivation of due process, drug abuse, etc.), however, usual suspects can be rounded up but the linkage between the crisis, and the cause is more speculative.

This chapter highlights the subjective nature of social "crises" and the role the media plays in "spinning" interpretations of widespread problems. It is clear that the media can elevate or deemphasize problems in their coverage. Why, when, and how the media choose to focus on specific events is an issue that deserves further attention. The Trayvon Martin and Freddie Gray deaths illustrate the significance of triggering events as well as the power of the media to shape the public narrative.

It is important to note that media attention waxes and wanes over time. The consequences of crises can have little long-term impact as short-term hysteria dissipates and vested interests reassert themselves. Alternatively, crises may lead to institutional changes that directly address serious problems. Crises that are either real or manufactured are not policy neutral; they have the potential to alter the status quo and jar open opportunities for change that did not previously exist. This phenomenon is associated with the metaphor of "policy windows," defined as opportunities to push solutions or to promote attention to given problems. Crises research in the future should not only look at observable tragedies but also at the forces that act to promote or ignore endemic social problems.

# Causes of Organizational Conflict

Duane E. Mitchell
Management and Education, University of Pittsburgh, Bradford, PA, USA

## Synonyms

Causes of conflict between an organization and one or more of its stakeholders; Causes of intergroup conflict; Causes of interpersonal conflict

## Definition

These are the causes of organizational conflict, in the field of organizational behavior: a social phenomenon involving task interdependence, differences between values and beliefs, the absence of/or ambiguous rules, resource scarcity, ineffective communication, and incompatible goals between some combination of individuals and/or groups which lead to interpersonal conflict, intergroup conflict, or conflict between an organization and one or more of its stakeholders.

## Introduction

There are many definitions for conflict in the literature across various fields and within the field of organizational behavior. However, there is some consensus within the field of organizational behavior about what organizational conflict is. This includes the idea that organizational conflict is a social phenomenon due in part to the perception of individuals that one party is being opposed or negatively impacted by another party (Griffin and Moorhead 2007; McShane and Von Glinow 2014; Robbins 1974). Additionally, there is much in the literature distinguishing conflict from competition. Competition is not conflict but may occur as a result of conflict when the parties involved become aware of incompatible goals (Rahim 2011; Robbins 1974; Tjosvold 2006).

In organizational behavior theory, two primary views have evolved over time about the value of conflict in organizational life. In the past, classical philosophers and human relations theorists believed that conflict was harmful to organizations. However, more current theories view a moderate amount of conflict to be healthy in organizational life (Rahim 2011). Therefore, it is important for leaders and managers to understand the nature and causes of organizational conflict in order to contain conflict to a constructive level throughout their respective organizations. Organizational conflict occurs in two forms: *affective conflict* and *cognitive conflict*. The causes of conflict may either be affective or cognitive in nature or both (Jehn 1997).

Affective conflict is sometimes called relationship conflict in the scholarly literature. It is social and emotional in nature and involves people problems, personal attacks, miscommunication, and interpersonal problems between one party and another due to incompatibilities or disputes (Amason and Sapienza 1997; Cosier and Rose

1977; Jehn and Bendersky 2003). Affective conflict may result in anger, distrust, frustration, stress, low morale, withdrawal, and decreased satisfaction so it should be kept to a minimum (Jehn 1997; Gulati et al. 2014).

Cognitive conflict is sometimes called constructive conflict in the scholarly literature and involves dissonance over tasks, processes, substance, content, legalities, or realistic demands and expectations between one party and another (Jehn and Bendersky 2003). Certain levels of cognitive conflict, depending on the situation, can result in creativity, challenging of the status quo, personal development, learning, increased motivation, and greater awareness of the problem at hand (Jehn 1997; Gulati et al. 2014).

There are six causes of organizational conflict; these are task interdependence, differences between values and beliefs, the absence of/or ambiguous rules, resource scarcity, ineffective communication, and incompatible goals. Each of these causes will be discussed in the following sections, respectively.

## Cause One: Task Interdependence

Task interdependence is the degree to which organizational members must collaborate with each other in order to accomplish assignments (Van De Ven et al. 1976). The more interdependent tasks are, the more opportunity and reasons organizational members will have to engage in conflict (Jehn 1995). In other words, increased interaction leads to increased opportunities for affective and cognitive conflict. There are three degrees of task interdependence: (a) *pooled interdependence*, (b) *sequential interdependence*, and (c) *reciprocal interdependence* (Thompson 1967).

The lowest degree of task interdependence is found with pooled interdependence where individuals, or individual units, make separate contributions to the organization (Thompson 1967). There is little interaction between individuals in this situation except regarding a shared reliance on the same leader. Therefore, fewer opportunities for individuals to engage in affective and cognitive conflict exist. In this arrangement, individual or unit contributions are "pooled" at the organizational level (Thompson 1967).

A mid-level degree of task interdependence is found with sequential interdependencies where the output of one individual, or individual unit, becomes the input for the next individual, or individual unit (Thompson 1967). This sequential workflow may continue through a few or many individuals or individual units. Assembly plants are a good example. In this situation, the direction of the work flow is one way (Thompson 1967). This situation provides more opportunities for interaction between individuals and therefore more opportunities for affective and cognitive conflict than the pooled interdependence arrangement.

The highest degree of task interdependence is found with reciprocal interdependence (Thompson 1967) sometimes called mutual task dependence (Walton and Dutton 1969). It is similar to sequential interdependencies except that work flows forward and backward instead of only one direction which increases the interaction of individuals or individual units (Thompson 1967). This increased interaction and dependency results in higher levels of affective and cognitive conflict (Jehn 1995).

## Cause Two: Differences Between Values and Beliefs

Divergences in values and beliefs are due, in part, to intergenerational differences. Individuals are not only influenced by pivotal societal events experienced by their generation, but they forge an affinity with the technology of their generational cohort (McMullin et al. 2007). Individual needs are also influenced by a person's generational cohort. For example, baby boomers were found to be motivated by an increased autonomy at work and philanthropic opportunities (Hewlett et al. 2009). Whereas, generation Y was found to be motivated by opportunities for advancement and a steady rate of advancement (Hewlett et al. 2009). Additionally, an organization's values and beliefs are imbedded in its culture through (a) formal statements of philosophy, creeds, and values; (b) organizational structure; (c) reward

systems; and (d) criteria for hiring and advancement at the organization (Gulati et al. 2014). This is particularly important during the merger and acquisition process because differences in organizational culture can lead to a myriad of affective and cognitive conflicts (McShane and Von Glinow 2014).

## Cause Three: The Absence of/or Ambiguous Rules

The absence of rules or the existence of ambiguous rules leaves the door wide open for conflict. For example, it may be unclear who has the power to make certain decisions, making it difficult to ascertain who deserves credit or blame for organizational outcomes, and it may be difficult to evaluate employee performance if procedures are missing or unclear (Walton and Dutton 1969). Risberg (2001) found ten areas of organizational life that are directly impacted by the absence of rules or the existence of ambiguous rules: (a) *ambiguities of purpose* – leave employees confused about what they should be doing; (b) *ambiguities of identity* – leave employees confused about their role or position in the organization; (c) *ambiguities of power* – leave employees confused about their decision making abilities, and leadership responsibilities, (d) *ambiguities of understanding* – leave employees confused over how things should be done around here, (e) *ambiguities of experience* – leave employees confused about the usefulness of their knowledge in the future, (f) *ambiguities of success* – is when employees do not know who is responsible for designing success, or how it is defined, (g) *ambiguities of communication* – is when communication is unclear or misunderstood, (h) *ambiguities of the future* – is when employees have worries about being laid-off, (i) *Ambiguities of organizations* – is when, after a merger, changing individuals are in charge at different times, and (j) *ambiguities of negotiation* – is when, during an acquisition, employees are unclear about events. The absence of rules or the existence of ambiguous rules can lead to conflict which is affective or cognitive in nature or both.

## Cause Four: Resource Scarcity

Conflict which results from resource scarcity exists when two or more parties are vying for the same limited resources, for example, capital, human resources, equipment, and physical space (Walton and Dutton 1969). In this situation, one party's goals are undermined by another party's goals because the same resources are required to accomplish the goals of both stakeholders (McShane and Von Glinow 2014). Furthermore, in this arrangement the goals of both parties are individually attainable, and resource scarcity will not necessarily mean one party is completely denied resources, but rather some kind of compromise has to be reached. The nature of conflict due to resource scarcity can be affective or cognitive.

## Cause Five: Ineffective Communication

In their pseudo-conflict model, Rhenman et al. (1970) provided three reasons for the exchange of information to be unsuccessful: (a) semantic difficulties, (b) insufficient exchange of information, and (c) noise. Semantic difficulties are caused by the absence of a common language and the means to translate; insufficient exchange of information means that some information was not shared which would have added utility for the receiver of the information; and noise is anything that disturbs the successful transmission of information from the sender to the receiver (Rhenman et al. 1970).

Berlio (1960) described four types of noise that affect the successful transmission of information; these are (a) skills, (b) attitudes, (c) knowledge of the people involved, and (d) the social-cultural system impacting the situation. Our skills may cause noise through ineffective reading, writing, speaking, listening, or reasoning (Robbins 1974). Our attitudes may cause noise if they influence our behavior in a negative way (Robbins 1974). Our knowledge of the people involved may cause noise if it is not extensive enough or if it is too extensive for communication to be effective (Robbins 1974). Finally, the social-cultural

system impacting the situation includes our position in the organization, our values and beliefs, and the culture of the organization which impact who we listen to and how we are heard (Robbins 1974). Additionally, if a communication is rude, then a rude response may occur, or discomfort with the communication may reduce the amount of communication resulting in an escalation of affective or cognitive conflict or both (McShane and Von Glinow 2014).

## Cause Six: Incompatible Goals

The presence of incompatible goals is a perception that one party has the ability to interfere with the goals of another party (Schmidt and Kochan 1972). For example, an accounting department may wish to cut expenditures, while the marketing department wishes to increase spending on marketing activities. Conflict due to incompatible goals can be affective or cognitive in nature or both.

## Conclusion

Although there is no agreed upon definition for conflict in the scholarly literature, there is consensus within the field of organizational behavior that conflict is a social phenomenon involving a perception that one party is being opposed or negatively impacted by another party (Griffin and Moorhead 2007; McShane and Von Glinow 2014; Robbins 1974). Competition and conflict are different things (Rahim 2011; Robbins 1974; Tjosvold 2006). Further, there are six causes of organizational conflict: (a) task interdependence, (b) differences between values and beliefs, (c) the absence of/or ambiguous rules, (d) resource scarcity, (e) ineffective communication, and (f) incompatible goals. These may be affective or cognitive in nature or both. Managers and leaders should minimize affective conflict, but allow a certain amount of cognitive conflict depending on the situation (Amason and Sapienza 1997; Cosier and Rose 1977; Gulati et al. 2014; Jehn 1997; McShane and Von Glinow 2014).

# Centralization and Decentralization

Can Umut Çiner
Faculty of Political Sciences, Ankara University, Ankara, Turkey

## Synonyms

Consolidation & fragmentation; Direct rule & Indirect rule; Unite & spread (out)

## Definition

Centralization is the method and approach of administration that manages all services and power from the center. This requires the unification of control and activities under a state authority. Decentralization, on the other hand, is a method and approach by which powers and responsibilities are transferred to units away from the center. It is the transfer of authority from central administration to (state and/or) local administrations or governments.

## Introduction

There are two processes for the regulation and enforcement of public services and public power: centraliz(s)ation and decentraliz(s)ation. However, Aucoin and Bakvis (1988: 115) argues that this is a conondrum since "...in principle and in practice the proper functioning and the management complex organizations require simultaneous existence of both centralization and decentralization."

## Centralization

Centralization is the method and approach of administration that manages all services and power from the center. Through this method, public power, decision-making responsibilities, and a monopoly on enforcement are held by the center, or in other words, by the state. In this administrative system, the center acts as the determining agent and plays the primary role. All the activities are carried out from the center or at sites determined by the center. Public force is concentrated in the center or at sites determined by the center, which organizes services and shapes the structure and staff of the sites where these services will take place. Therefore, centralization leads to a high concentration of power. This power means that authority makes decisions through its organization and staff, by which public power is exercised (Grazia 1964: 81; Jan 2003: 14; Cornu 2007a: 140; Davignon 2014: 55–56).

Centralization requires the establishment of various organizational structures in order to disseminate decisions taken by the whole structure. It is essential to ensure contact between these structures and the center. Therefore, the principle of hierarchy is the most essential instrument of centralization. All the actors in general and public officials in particular are connected to each other through the principle of hierarchy in order to ensure the integral unity of the center. Furthermore, all the units within the centralized structure are under the legal personality of the state (Davignon 2014: 55–56; Örnek 1988: 84; Chapuisat 2016a).

## Concentration and Deconcentration

As a result of this organizational principle and technique, all activities required by the center are fulfilled either by the center itself or through the center. From this perspective, it is possible to say that from centralization emerges two directions or

implementation methods. The first one is concentration, which is a situation that is almost impossible to reach in practice. Accordingly, all organizational activities should be fulfilled by the center or by organs of the center. In such cases, it is not possible to talk about local administration systems (or local governments). Concentration may emerge only in the case of a crisis or in countries experiencing conflict, war, or economic depression (Van Lang et al. 1999a: 50; Davignon 2014: 55–56; Chapuisat 2016b).

The second direction is deconcentration. In this method, the deconcentration principle is used in order to make better use of the center against concentration, which is practically impossible, and extend this power all over the country. It means allocation of power stemming from the decision-making process and the implementation of power of the center to a person/public official presiding over a position or service. The center intrinsically ensures extension of all services of the state over all of its territories. To this purpose, territories of the state are necessarily divided into administrative units or zones, and one representative of the central administration is appointed in each of them. From this perspective, deconcentration means the reorganization of the decision-making process top down (Davignon 2014: 55–56; Divay 2012b; Chapuisat 2016b). Administrative units that are decentralized hold some authority, although limited in scope. The characteristics of this authority depend on the specific conditions of the state that is involved. The technical, financial, and legal relationships among them and between them and the center are fulfilled through hierarchical principles.

When we talk about centralization in modern states, states with deconcentration are implied by necessity. In other words, deconcentration today is a kind of mandatory form of organization/application of centralization (Davignon 2014: 55–56).

In centralization, the basic role of the state/government is to act as a unitary hierarchical power with a uniform perspective, without consideration of local disparities. In the administrative doctrine (administrative science and administrative law), centralization has always consisted of the organizations within the state legal personality. Apart from the state legal personality, administrations within the public legal entity are classified outside of centralization as the organizations of decentralization.

## French Model

In order to comprehend the relationship between centralization and decentralization, it is essential to analyze the French model, which is the first example that implemented the method of centralization. France is the homeland of centralization. The unitary state, being centralist and ignoring local disparities by nature, is an administrative system in which political power takes the decision from a single center and with a single legal system applied all over the country. Centralization historically started with Henry IV in France and was used as an instrument to eliminate feudality, and since then, it is regarded to be the appropriate method for ensuring national unity, public authority, equal treatment between the administration and those being administered, and development of public services (Jan 2003: 14; Debbasch 2016).

A unitary state cannot be divided, which implies that political power cannot be divided into single or varied fragmentations, and thus, all the citizens rely on the same government. Article 1 of the French Constitution of 1958 states, "France shall be an indivisible republic" (*la France est une République indivisible*). This principle has been included in all French Constitutions since 1791, meaning that previously the Kingdom and then the Republic after 1792 are indivisible.

Supporters of the decentralization movement initiated reforms during the early 1980s in France. Accordingly, plenty of power held by the central government has gradually been transferred to the municipalities (*communes*), provinces (*départements*), regions (*régions*), communities with special status (*collectivités à statut particulier*), and overseas communities (*collectivités d'outre-mer*) since 1980. In an amendment to the Constitution in 2003, decentralized organization was incorporated into the first article of the French Constitution, which constitutes the most significant result of the

decentralization reforms initiated during 1980s. However, despite all of these developments, it is highly essential to note that France is still a unitary state with a decentralized organizational structure.

What is interesting is that the French Constitutions have ignored the term decentralization until the amendment in 2003 and adopted the principle of *libre administration* (literally "free administration") instead, which holds the same meaning as decentralization (Jan 2003: 24). The French Constitution envisages legal control of the activities of the local governments in the country (Kada 2014: 132).

In addition to all of these developments, centralization has also been exposed to substantial changes in France. However, while the government carries out certain services in its regions through deconcentration, decentralization has become more significant in particular after the decentralization reforms.

The principle of deconcentration has historically evolved as a result of centralization in France, which is characterized by French statesman Odilon Barrot as follows: "It's the same hammer that strikes, but one has shortened the handle." (*C'est le même marteau qui frappe mais on en a raccourci le manche*.) (Jan 2003: 17).

Alexis de Tocqueville is one of the first individuals who come to mind when centralization is mentioned. In his book titled *Democracy in America*, he defines two distinct types of centralization: Administrative centralization and governmental centralization. This distinction has been a major topic of discussion with regard to centralization. Accordingly, there is more than one form of centralization and decentralization each. Concerning centralization, in addition to Tocqueville and foundational works on classical French administrative law, literature on American public administration should also be studied.

## Decentralization

Decentralization is a method and approach by which powers and responsibilities are transferred to units away from the center. The first distinctive definition of decentralization goes back to a system of decentralization that enables a community within certain geographical boundaries to administer itself. In other words, it means that administration takes place at the "local" level rather than at the "center" by the beneficiaries and responsible members of the administrative unit. From this perspective, the term "local administration" is attributed in daily use to this style of administration (Van Lang et al. 1999b: 93; Cornu 2007b: 265). It can also be defined as a method of administering various autonomous units from a single center. Another definition describes it as the distribution of "units accumulated on a certain center" (Trésor de la langue française informatisé – Treasure of the computerized French language 2016). It is not found within a state legal personality as centralization is, and there is no hierarchy between the different levels of administration. Each of these units constitutes a separate public legal personality (Kada 2014: 131–132).

Decentralization has two political and administrative categories with respect to the authority of the related administrations over public management. In the literature, political decentralization means distribution of executive, legislative, and judicial powers to various public legal personalities. This is an organizational structure often seen in federal states and displays a regime based on autonomous status allocated by the related constitutions to local governments without national identity. On the other hand, administrative decentralization is a regime seen in unitary states, and their local governments hold only some executive powers and duties.

## Territorial and Functional Decentralization

Administrative decentralization can classically be classified as two types based on how it is implemented: territorial (*territorial* (fr.)) and functional (*fonctionelle – technique/service* (fr.)). Decentralization by territory is usually seen as communities, provinces, and regions in different states. A key feature of decentralization

by territory is that it derives from a local government. This administration consists of persons elected by the public, and local needs are determined and met within this territory. In territorial decentralization, administrative autonomy is recognized in order to ensure that people within a certain geographical region meet their common and local needs through organs that are already elected by the same people (Cornu 2007b: 265; Kada 2014: 131–132).

The organization of the decentralized system has an impact on the limited number of public policies, and these administrative units have separate public legal personalities. They have their own properties, independent sources of income, and private budgets, and they make their own decisions. In other words, they are administratively autonomous. Furthermore, the scope (financial, political, etc.) and extent of this autonomy may vary depending on the conditions of the state.

Decentralization by service, or functional decentralization, means fulfillment of certain public services by an organization other than the center. In this case, autonomy relates to the services being provided (Kada 2014: 131–132).

Some people believe that decentralization is democratic since it allows those being administered to take part in the decision-making process of the public works. It can be considered as an indispensable element of democracy that a local community administers itself. However, the condition here is clear. The democratic relationship between the central administration and decentralized administration can be explained by their associations with each other. More clearly, a decentralized administration can be democratic as long as the central administration is democratic.

Another essential point that needs to be highlighted with regard to decentralization is that the autonomy offered by decentralization both in terms of territory and services is legally limited. This situation is often confused with deconcentration. Hierarchical power within the state legal personality emerges either as an administrative tutelage between the state legal personality and other public legal personalities (as in deconcentration) or as a legal inspection of the activities of the local government (as in decentralization).

## Decentralization Policy

It is possible to extend the scope of the definition of decentralization as a method of administration in the public policy literature. Decentralization, as a public policy, refers to the transfer of power from the center to the local level while strengthening local governments both administratively and financially. The transfer of the power implies execution of a power that was previously fulfilled by the central administration or government by a local government with elected organs (Divay 2012a; Jan 2003: 25). It also aims to increase the democratic capacities, legitimacy, and action fields of the subnational units (Lidec 2011: 128). Democracy and activism are leading motives for putting forward a local government system in this policy. From this perspective, this policy may have different results on developed and underdeveloped countries induced by a neoliberal economic order. The decentralization policy has been followed by area regulating policies in Western Europe and put forward in order to eliminate the redundancies of centralization and strengthen local government. It has played a significant role in balancing centralization and reducing regional and spatial imbalances, thus providing the basis for decentralization as a policy to create a middle level between the center and local communities (George and Verger 1996: 123). It is important to note that the rationale behind the decentralization policies in postcolonial countries can be found in the development administration discourse (Fritzen and Ongand 2015: 770)

Decentralization as a public policy means that the state recedes into the background against the market, a process that has accelerated with globalization. The development of decentralization in line with the globalization process also arises with economic and social decentralization policies. Accordingly, power is transferred by and from the central administration to the private sector through economic decentralization. In social decentralization, administrative and financial powers and responsibilities are transferred from the central administration to nongovernmental organizations. Here, the crucial point is the quality of the nongovernmental organizations. One of the

main criticisms about governance is the lack of quality of the nongovernmental organizations, as they have a low/poor capital basis.

Furthermore, decentralization policy also develops from a tendency to support civil society and privatization policies as well as the administrative structure or system. Due to this aspect, decentralization practices in underdeveloped countries in particular are carried out under the guidance of international organizations with a goal of directly strengthening the private sector. Postcolonial countries are also guided in the adoption of administrative practices imposed by international organizations such as the World Bank and the United Nations Development Programme, as a prerequisite for receiving development funds. From this aspect, decentralization policy is closely associated with development management in underdeveloped countries.

From a similar perspective in geography, decentralization is commonly used to refer to the transfer of services, industry, and industrial organizations from the center to other locations (George and Verger 1996: 122). This definition is related to the process through which production areas are reorganized and tasks are shared as a result of globalization.

It is a common mistake to present "centralization" and "decentralization" as alternatives to each other. In making this mistake, the pros and cons of "centralization" and "decentralization" are discussed within the context of administration and law. The strengths of one side constitute the weaknesses of the other. Distinctive characteristics that define centralization are that it is holding fundamental authorities and the characteristics' generality. In other words, these are various functions that cover the whole country. Units of decentralization exist in order to provide certain services or local common needs in a certain location. Countries with a unitary state model rely on a centralist organizational structure and govern based on the principles of centralization. Centralization refers to uniformity in the preparation of norms, their application, and utilization of sovereignty over the whole territory of the country. This also means that a monopoly over decision-making and use of force is held by the center. The place of decentralization in this structure is that it plays a supplementary role for the center rather than constituting an alternative to it. Therefore, it is not possible for local governments to exist without centralization, and the "local" is a category defined based on the "center." The logic behind the organization of federal states is completely different due to the intrinsic characteristics of these states. Another category of state structure in addition to these is the regional autonomous state (or regionalized state) – such as Spain – which also presents another field of study and discussion in recent years.

There is a perception in the academic literature that centralization is negative while decentralization is positive. Although this perception has historical and social reasons, it should not be forgotten that referring to one of them as superior demonstrates an ideological preference rather than the outcome of a scientific analysis (Grazia 1964: 81). Furthermore, if states choose centralization, their activities will display homogeneity and uniformity; if they choose decentralization, they reflect the different wills of various territories with regard to administration (Örnek 1988: 83).

## Conclusion

In conclusion, irrespective of an analysis of it, the relationship between the central and local levels of administration depends upon the economic, social, and political conditions of each state. It is necessary to pursue answers about the preferences of states as to why they are inclined to bring forward and be administered by centralization or decentralization through an analysis of the historical and sociological characteristics, economic relations, and position of the dominant class within a state. From this perspective, it is seen that the relationship between central and local levels is a matter of criteria. A public service/function can be handled by local governments in some countries or by central administrations in others. All the factors mentioned above play

clear roles in the application of these criteria. However, the most significant variable of these criteria is the approach of the state in this regard. In other words, the choice between centralization and decentralization is a political preference of states. Discussing these criteria certainly is and will be one of the most significant topics in the social sciences.

# Centralization and Decentralization: Balancing Organizational and Employee Expectations

Jaehee Jong[1] and Sue R. Faerman[2]

[1]Department of Public Administration, School of Public & Global Affairs, Northern Illinois University, Dekalb, IL, USA

[2]Center for Women in Government and Civil Society, University at Albany-SUNY, Albany, NY, USA

## Synonyms

Centralization: hierarchical command and control; decentralization: participative decision making, delegation of authority

## Definitions

Centralization refers to organizational structures and procedures that concentrate power and decision-making authority at the highest levels of the organizational hierarchy. Decentralization refers to organizational structures and procedures that allow for power sharing and delegation of decision-making authority to lower levels of the organizational hierarchy, including decision making by front line employees.

## Introduction

In the past few decades, much organizational literature from both the public and private sectors has argued for the benefits of reducing bureaucracy. Indeed, many public management scholars have asserted that bureaucratic characteristics such as red tape, rules, and standardized procedures negatively affect organizational effectiveness and responsiveness to constituents and lead to such negative employee work outcomes as alienation and lower levels of motivation, well-being, and creativity. These scholars also argue that centralization of power and maintaining decision-making authority at the top of the organizational hierarchy does not allow those who are closest to the work to share their knowledge and experience with those who are making the decisions. At the same time, organizations, as well as scholars, have noted the benefits of bureaucratic characteristics for employees and constituents as well as for organizations as a whole (Adler 2012). For example, some argue that public organizations cannot be accountable to the public without standardized procedures; that is, reporting mechanisms that assure legislators and constituents that government organizations are performing effectively and that public monies are being well spent require standardized procedures. Of course, in order to have standardized procedures, certain powers and decision-making authority need to be centralized.

The purpose of this entry is to explore both the positive and negative aspects of centralization and decentralization for organizations and their employees and to highlight the need for public organizations to embrace both centralization and decentralization in order to serve their constituencies most effectively. In addition, this entry explains that determining which processes, procedures, and decisions will be centralized and which will be decentralized requires organizations to consider aspects of societal culture, the nature of the work being performed, and employee characteristics. The entry concludes with several general principles that can help organizations decide how to balance organizational and employee needs and expectations with respect to centralization and decentralization.

## Defining Centralization and Decentralization

As Pollitt (2005) notes, while the term decentralization generally describes "the notion of *authority being spread out from a smaller number to a larger number of actors* (p. 373, emphasis in the original), there are different ways to spread authority, and so the term has been used to refer to several different governance approaches and organizational structures and has different meanings in different contexts. For example, decentralization has been used to describe authority spread from one level of government to another (sometimes referred to as devolution) and authority transferred to other organizations, as well as authority delegated within an organization from higher levels of management to lower levels of management and/or employees. Pollitt (2005) also notes that similar terms can have different meanings in other languages. For example, the French word "*décentralisation*" generally refers to "the giving of new powers and political responsibility to another authority, such as a local government... [and] is distinguished from *déconcentration* which is the delegation of executive tasks from a ministry to field services" (p. 376).

The focus of this entry is on decentralization that occurs within organizations, including situations where higher-level managers delegate decision-making authority to lower-level managers and where decision-making authority is delegated to employees. It is important to note that while some organizations may be described as more centralized (i.e., most, if not all, decision making occurs at higher levels of the organizational hierarchy) and other organizations may be described as more decentralized (i.e., many decisions are made at lower levels of the organizational hierarchy), most organizations would be characterized as having a mix of centralization and decentralization. Thus, rather than characterizing organizations as centralized or decentralized, it is necessary to speak of the degree of centralization or decentralization and to consider which procedures and decisions are determined at the top of hierarchy and which

involve other individuals in the organization (Meyer and Hammerschmid 2010).

## Advantages vs. Disadvantages of Centralization and Decentralization for Organizations and Employees

Given that both centralization and decentralization have advantages as well as disadvantages (benefits and costs), it is reasonable to assume that determining which processes and decisions need to be centralized and which can/should be decentralized within an organization requires careful consideration of these advantages and disadvantages. Implied here is the notion that because a process or decision can be decentralized does not necessarily mean that it should be. Moreover, determining which processes should be centralized and which can/should be decentralized also needs to take into consideration national contexts, the nature of the work, and/or employee characteristics that might affect the potential advantages and disadvantages. This issue will be examined in greater depth in the next section; here, the focus is on providing some general advantages and disadvantages of centralization and decentralization for both organizations and employees.

Most scholars note that centralization allows for greater stability and efficiency in organizations than does decentralization. First, centralized processes generally allow organizations to benefit from economies of scale; that is, every department/division within an organization does not need to have separate units for processes that can be handled centrally. Alternatively, decentralized processes require each unit to develop its own approach, which potentially reduces the resources and level of expertise available to address issues and solve problems. Second, as noted above, there are benefits that derive from standardization that can only be achieved through centralized processes. For example, public organizations are often mandated to report certain information to other entities, such as other government agencies or legislative bodies, which requires standardized reporting mechanisms. Standardization is also important to ensuring that different constituents as well as different employees receive equitable treatment. Decentralized processes, on the other hand, can increase the likelihood of special treatment for some and biased treatment toward others. Third, centralization allows for better coordination across units performing related functions (and less duplication of efforts). For example, social service agencies may have several units that deal with different aspects of child health. A centralized body can reduce overlap of effort across the units, while decentralization can lead to several units working on the same issue using different sets of assumptions and approaches.

Although there are some clear organizational advantages to centralization, there are also clear advantages to decentralization. First, because decentralization allows decisions to be made by those who are closest to the situation, decisions can be made more quickly. Alternatively, centralization slows decision making because information must travel up the chain of command to higher levels of the organizational hierarchy, which are likely also focused on other issues. Second, decentralization is more likely to be responsive to constituents' needs since those closest to the situation have more localized knowledge of issues. Alternatively, centralization can lead to decisions that do not consider differences in needs across different contexts. Finally, because employees who are closest to the situation have more knowledge of the situation, they are also more likely to develop innovative and novel solutions when given the chance, that is, when they feel that their opinions are valued.

Although decentralization has numerous organizational benefits, much that has been written about decentralization focuses on the benefits to employees. First, when decision-making authority is decentralized, employees often feel higher levels of identification with the organization because they receive more information about how the organization functions and the issues it faces and, thus, employees have a better understanding of how their work contributes to the overall organizational mission as well as greater role clarity. Moreover, when employees are involved in decision-making processes, they can

see how their ideas are being utilized to improve organizational functioning. Second, employees who are involved in decision-making processes often feel more empowered and, thus, become more highly motivated and productive. Indeed, a frequent argument against centralized decision-making processes is that they lead employees to feel alienated from the organization. Third, some scholars argue that employees have greater trust in the organizational leadership as well as better, more trusting relationships with their direct supervisors when decentralized processes provide them with more information about organizational issues.

While most literature on decentralization emphasizes its advantages to employees, some scholars have described advantages of centralization for employees. First, to the degree that organizations with centralized structures are more stable and more efficient, employees in these organizations may benefit from greater job security and more career opportunities. Second, as noted above, some centralized human resource management procedures are specifically designed to protect employees from arbitrary or subjective actions by their managers and to ensure equitable treatment across all employees. Third, some researchers have found that some employees appreciate standardized procedures that derive from centralization because the standards allow for consistency of output that is important to their work.

## Employee and Organizational Preferences and Expectations

Much that has been written about the contrasting advantages and disadvantages of centralization and decentralization assumes a certain level of similarity across organization and across employees in these organizations. Some research, however, suggests key differences in national contexts (societal cultures), the nature of work, and individual employees that can alter the degree to which these advantages and disadvantages apply.

Although reform initiatives across the globe have emphasized the advantages of decentralization, some researchers have found that societal cultures influence how these initiatives are implemented. For example, using Hofstede's (2001) dimensions of societal culture to study the degree of decentralization of human resource management practices in 27 European central governments, Meyer and Hammerschmid (2010) found that power distance (the degree to which people within the society accept inequality and that those with less power should defer to those with greater power) and uncertainty avoidance (the degree to which people within the society are uncomfortable with ambiguity and uncertainty) were negatively related to the level of decentralization; and individualism (the degree to which people within the society believe they are only responsible for themselves and their immediate family vs. collectivism, the degree to which individuals believe they are responsible for their extended family and community) was positively related to the level decentralization. They concluded that while "most EU member states report initiatives towards HR-decentralization and often these initiatives sound similar" (p. 473), the differences across these arrangements and degree of decentralization suggest that national context plays a strong role in how decentralized systems are implemented. Similarly, in a conceptual study examining contemporary public administration in South Korea, Im et al. (2013) argued that South Korea's relatively high power distance score derives from the country's Confucian heritage, which views the concepts of centralized power and decentralization differently from how they are viewed in Western cultures. Moreover, they note that "Korean culture tends to produce a highly 'bureaucratic type' that relies upon the rules and regulations of the organization... [which] reduces the chances that one would have to act in a discretionary manner... [and] opening his or herself up to censure should the discretionary action produce negative or unintended consequences" (p. 293). These examples highlight the notion that advantages and disadvantages of centralization and decentralization are influenced by their alignment with societal culture.

Interestingly, some functional domains and occupations within organizations also have

tendencies toward centralization or decentralization. Building on work of researchers who examined whether cognitive styles influence individuals' occupational choices and work environment preferences, Cools et al. (2009) hypothesized that different functional areas would be characterized by individuals with particular cognitive styles, which would lead to a particular cognitive climate. By studying individuals in a variety of different functional areas, these researchers found that finance, information technology, and research and development functions had a knowing-oriented climate (individuals preferring "a logical, rational, and impersonal way of information processing"); administrative and technical and production functions had a planning climate (individuals preferring "order. . .[and] an objective, structured, conventional, and efficient problem-solving approach"); and sales and marketing functions and general management had a creating climate (individuals "hav[ing] a preference for a creative, unconventional, and flexible way of decision making") (p. 170). While there are clearly differences among people within functional areas, this research suggests that some functions may favor centralized processes and decision-making authority, while others may favor decentralized processes and decision-making authority.

Like societies and functional areas, individuals have differing expectations, needs and preferences regarding working in centralized vs. decentralized work environments. As one approach to understanding individual expectations, needs, and preferences in the workplace, person-environment fit theory (Jansen and Kristof-Brown 2006) assumes that a mismatch between individual characteristics (needs, interests, values, preferences, abilities, and expectations) and work environment characteristics (requirements of jobs, rewards provided by jobs and organizations, etc.) will likely lead to employee dissatisfaction, which can result in decreased work effectiveness, as well as negative psychological and physical outcomes. One dimension of person-environment fit, person-job fit, focuses specifically on "the relationship between a person's abilities and the demands of a specific job or the desires of a person and the attributes of a specific job" (pp. 193-194). Thus, if employees feel constrained and/or undervalued by centralized decision-making and authority structures, their motivation, job satisfaction, and productivity may all suffer. Conversely, if employees prefer greater structure and/or see the value in standardization of work output, they may be uncomfortable with working in more decentralized environments. Thus, even if employees have the skills and abilities to perform their jobs effectively, their person-job fit may be reduced if they prefer working alone, rather than being involved in team-based decision making. Along these lines, Berings et al. (2004) examined the degree to which 12 work values – defined as "broad tendencies to prefer general job characteristics" (p. 349) – predicted individuals' vocational choices. Interestingly, while several of the values studied describe the nature of the work itself, other values – including autonomy, influence ("on participation and decision making"), structure ("a well-organized and structured workplace"), team ("accent on team-work and team spirit"), and stability ("stability and continuity in organization") (p. 356) – describe how the work is performed, and are logically related to aspects of centralized or decentralized work environments. Thus, based on differences in work values, some employees will welcome being involved in decentralized decision-making processes, while others will not.

## Balancing Organizational and Employee Expectations, Needs, and Preferences

Ultimately the organization determines which processes are centralized and which are decentralized. Such decisions need to take into consideration both organization and employee expectations, needs, and preferences, as well as the societal context and the nature of the work. In some cases, a process may have multiple aspects, phases, or stages, and it may be appropriate to centralize some aspects, phases, or stages, and to decentralize others. In doing so, it is not only important to consider whether the societal culture

and work unit climate favor centralization or decentralization, but also whether the issue would be addressed more effectively by people with specific expertise or by people with diverse experiences and backgrounds. If expertise is need, the organization needs to determine where the greatest expertise is located, for example, closest to the work being performed, which would favor a decentralized process, or at the highest level of the organization, which would favor a centralized process. In either event, depending on the societal culture, it may be important to explain to employees why a process should be centralized or decentralized. Moreover, when a decision is made to decentralize part of a process or to ask employees for input, but not give them full decision-making authority, it is important for supervisors to help employees understand and feel comfortable with their role. Alternatively, if a process is fully decentralized and work units at lower levels of the organizational hierarchy have full decision-making authority, organizations need to ensure that employees have the necessary resources to take responsibility for the process as well as know who else may have knowledge or other resources that may benefit the process. In addition, even when a decision is centralized, the organization might benefit from having input from lower levels of the organizational hierarchy. Alternatively, even when a decision is decentralized, the organization might benefit from having some coordination (centralization) in decision making.

## Conclusion

Most recent government reform initiatives have stressed the value of decentralization. Yet, there are also clear advantages for both organizations and their employees in centralizing some processes. When determining which processes should be centralized and which can/should be decentralized, organizations need to avoid thinking of centralization and decentralization as an either/or choice. Rather they need to (1) recognize the value of both centralization and decentralization as well as the expectations, needs, and preferences of the organization as a whole, of specific functional areas in the organization, and of employees, and (2) evaluate and balance differing expectations, needs, and preferences as well as consider the societal context. In some cases, it will be possible to integrate expectations, needs, and preferences of organizations and employees; in other cases, organizations will need to consider tradeoffs. In addition, they need to be aware of Pollitt's (2005) conclusion that "the 'right' balance between centralization and decentralization is usually only a temporary one" (p. 393).

# Challenges of Forest Governance

Thi Kim Phung Dang
Faculty of Social Sciences and Humanities, Ton Duc Thang University, Ho Chi Minh City, Vietnam

## Synonyms

Forest bureaucracy; Forest administration; Forest authority; Forest governance; Governance

## Definition

Challenges of forest governance refers to the problems of actors' cooperation in forestry

## Introduction

Forest governance is a widely used concept but with different definitions. Generally, it denotes "the ways in which forests are governed" (Krott et al. 2014). Specifically, it refers to the processes of making and implementing decisions that are characterized by formal and informal regulations, actors' power relations, and decision-making practices (Sinclair and Kean 2006). These do not take place in vacuum but in specific conditions of politics, organization, and culture (Meinzen-Dick and Knox 2001). Effective forest governance is considered the key to sustainable forest management (Agrawal et al. 2008).

Literatures on forest governance recognize a number of its types. Until the mid-1980s, forest management was highly centralized and primarily for economic development (Agrawal et al. 2008). The common way of governing forest resources was command and control by regulatory policies (ibid.). However, governments, especially in developing countries, often lack the capacity and resources to enforce their regulations, making many public forests an open access for exploitation (Meinzen-Dick and Knox 2001). The high rates of deforestation and severe conflicts among forest agencies and local people led to the collapse of state forestry in the late 1980s (FAO 2016).

Changing forest governance over the last two decades has involved multiple actors in forestry. This involvement takes various forms including, among others, forest decentralization, forest devolution, forest concession, and forest certification (Agrawal et al. 2008; Fisher 2000). *Forest decentralization* is the transfer of administrative functions in forest management from a central to regional or local governments (Fisher 2000; Meinzen-Dick and Knox 2001). The main justification for this transfer is that local governments are better than central governments to develop appropriate forestry policies because they have good knowledge of the local environment and local needs for forest products (ibid.). *Forest devolution* is the devolvement of decision-making power in forest management from central governments to users/user groups (public or private organizations, individuals, and households) (Fisher 2000). This transfer is expected to facilitate a more diverse set of actors in forest management (Meinzen-Dick and Knox 2001; Sikor and Tran 2007). *Forest concession* is the allocation of forest management rights between the two parties through concession agreement(FAO 2016). These include individuals, private companies, and communities responsible for managing and exploiting forest resources. Forest concession is hoped to accelerate economic development, such as employment and infrastructure (ibid.). *Forest certification* is a process of monitoring and labeling that forestry companies voluntarily comply to demonstrate that their products are from sustainably managed forests. This process is based on a set of agreed standards for monitoring and labeling of forest products. The formulation and implementation of these standards highlight the essential role of civil society organizations and market incentives, which assist significant changes in

consumer preferences for forest products (Agrawal et al. 2008).

Changing forest governance that facilitates actors' cooperation in forestry has its own problems. The purpose of this entry is to provide an overview of major challenges of forest devolution, the popular forestry reforms in developing countries, since the late 1990s (Agrawal et al. 2008; Fisher 2000; Sikor and Tran 2007). Forest devolution varies in practice across countries. It takes the form of forest land allocation in China and Vietnam, where individuals, households, and organizations engage in forestry activities through forestry contracts or land use certificates (Dang et al. 2017). Forest devolution to local communities is more common in India, Nepal, Ghana, and Nicaragua (Agrawal 2001), and there are also joint forest management agreements in India and Tanzania (Mayers and Vermeulen 2002).

This entry begins with a discussion of theoretical perspectives on forest devolution. The next section examines the major challenges arising from the involvement of multiple actors in forestry. The final section concludes with the main features of forest devolution's challenges, their linkages, and relevant policy implications.

## Theoretical Perspectives on Forest Devolution

The high advocacy for forest devolution has been inspired by theoretical perspectives on collective action, public participation, and property rights in natural resource management. Actors' cooperation has long been a major issue of forestry. This is because protecting large forests in remote areas with diverse topography is often labor-intensive (Harrison 2003). Furthermore, forest products are not only a source of income for national and local governments but also raw materials for industries and the livelihoods of millions of forest-dependent people. The spatial scale of forests and the multiple uses of resources make collective action crucial to forest management (Harrison 2003). Collective action occurs when individuals with common interests collectively make efforts to achieve their mutual benefits (Tchigio 2007). This action requires some collective rules for using/not using the resources and structures of decision-making, monitoring, punishing violators, and resolving disputes (Schlager and Ostrom 1992).

The transfer of control over forests from central actors to local users aims to facilitate collective action between the state and local people in forest management (Meinzen-Dick and Knox 2001). Local users' knowledge on forest resources gives them a theoretical advantage over state agencies in forest management (ibid.). The objectives to protect forests for the sustainable use are likely to be achieved because users have incentives to sustain forests for their livelihoods and thus are willing to mobilize their resources (cash, labor) for forest protection (Dang et al. 2017; Meinzen-Dick and Knox 2001). Different types of forest devolution (e.g., forest land allocation and forest management) use a variety of instruments (e.g., forestry contracts, land use rights certificates, agreements forest management, etc.) to regulate actors involved in using and monitoring forests (Dang et al. 2017; Meinzen-Dick and Knox 2001).

The increasing advocacy for collective action in forestry resonates very well with the growing recognition of public participation in natural resource management. It is thought that public participation makes planning and decision more effective because it brings local knowledge and alternative solutions to the table (Agrawal and Ribot 2000). Local participation in forestry is also expected to promote social equity by empowering the often-marginalized actors and allowing forest management to meet local needs. These are essential conditions to reduce conflicts between forestry agencies and local people.

Public participation in forest devolution can take place at different levels: planning, decision-making, implementation, and evaluation (Ranjit 2014). The first two levels are widely considered critical because participants can have their say in the issues affecting their life (ibid.). The more affected users are able to have their say in the process, the more likely they are to mobilize their resources for forest management (Meinzen-Dick and Knox 2001). Besides levels, the issue of

representation is also equally important to public participation. The selection of stakeholders' representation in the management of forests, like other natural sources, is mainly interest-based, and inadequate representation of affected users is believed to weaken local involvement (Kazemí 2002).

Given the necessity of collective action and public participation in forestry, the ensuing question is what facilitates and sustains local users' efforts and involvement in forest management (Tchigio 2007). Because forest devolution transfers rights and responsibilities from state agencies to local user/user groups, many authors argue that providing forest users with property rights is critical to ensure their collective action in forest management (Ranjit 2014). Property rights refer to a bundle of rights, comprising of access, withdrawal, management, alienation, and exclusion rights (Schlager and Ostrom 1992). By defining the rules, rights, and obligations of local users in forest devolution, this bundle of rights is thought to encourage/discourage actors' collective action in forest management (Meinzen-Dick and Knox 2001). The management and exclusion rights are considered the most important because they enable the holders to authorize and control over forest resources. These rights determine the sustainable use of forests because they guarantee the holders to gain future benefits of their investing in forest management and make them suffer losses if forests are degraded (Harrison 2003; Meinzen-Dick and Knox 2001). Property rights are also hoped to contribute to local livelihoods because the holders have the rights to harvest forest products and engage in business agreements (Mayer and Vermeulen, Mayers and Vermeulen 2002). Due to these reasons, property rights are considered essential to actors' cooperation in forestry (Harrison 2003).

## Challenges of Forest Governance

Despite the supposed advantages of local users in forest management and the high pressures for forest devolution (Meinzen-Dick and Knox 2001), the transfer of forest rights to local users does not go smoothly. While there are some successful examples, such as forest devolution in Indian Himalaya (Agrawal and Chhatre 2006), case studies in developing countries reveal three major challenges of forest devolution. These include gaps between forest devolution's rhetoric and practices, conflicting objectives of actors involved, and the negative impacts of property rights on actors' cooperation in forestry (Dang et al. 2017).

### Gaps Between Forest Devolution Rhetoric and Practices

Despite strong commitments to forest devolution, governments in developing countries seem reluctant to provide user groups with a complete bundle of property rights, needed for the control over the devolved forests (Dang et al. 2017; Fisher 2000; Mayers and Vermeulen 2002). Users/user groups in Asia and the Pacific region are primarily responsible for forest protection, not for decision-making and using forests (Fisher 2000). In Vietnam, for example, the majority of forest land is designated as special-use and protection forests, which must be managed by state agencies (Dang et al. 2017). Although more participants have been granted land use certificates (LUCs) since 2010, most Vietnam's forest users are forestry contractors, who have only the access and limited withdrawal rights (ibid.). Restricting user rights is also common in Africa and South America (Harrison 2003).

The limited transfer of forest use rights to users/user groups is partly justified by the concern that local users may not have the ability to protect and manage the forests in a sustainable way (Fisher 2000). Governments, who are reluctant to give users property rights, also argue that the transfer of rights to a group or individuals will restrict the management of forest resources, which are critical not only to local users but also to the people of a country as a whole (Tchigio 2007). In response to this argument, Meinzen-Dick and Knox (2001) claim that although it is legitimate to question why certain users/users group should be granted forest property rights, a public good that should be managed for public interest, this issue can be solved if the holders are offered only some

specific types of property rights, such as, long-term tenure or use rights.

### Conflicting Objectives Among Actors Involved

Forest devolution authors, who argue that property rights are key to successful forest devolution (Meinzen-Dick and Knox 2001), seem to assume local people often share common objectives on forest protection and use with the governments. Dang et al. (2017) in their case studies on Vietnam's forest land allocation, however, found that local people's expectations in forest devolution might coincide with or different from the governments' objectives in forest management. This coincidence or difference could have a significant impact on the success or failure of forest devolution (Dang et al. 2017; Harrison 2003). These authors pointed out that actors' conflicting objectives in forest devolution mainly resulted from the lack of public participation. The planning and decision-making processes in forest devolution remained top down (Dang et al. 2017; Fisher 2000). The goals of national forest devolution thus were centrally defined and government agencies still dominated forest management. Even when there was participatory decision-making, some groups that were more organized and better able to represent themselves dominated the process (Sinclair and Kean 2006). The underrepresented and sidelined groups often included forest workers, small forest owners, and small forest user groups (Kazemí 2002). Some external factors (e.g., policies to develop agriculture) may exacerbate the conflicting objectives on forest management between of the government and local users, who primarily got involved to get access to forest lands for cash crops (Dang et al. 2017).

### The Potential Negative Impacts of Property Rights on Actors' Cooperation

The transfer of property rights from central governments to users/user groups has some positive impacts on forest management. The case of forest land allocation in Vietnam showed that more local people participate in forest planting and protection because they can get either forest contracts, which allowed them to access and withdrawal rights, or land use certificates (LUCs), which provided them with a more complete bundle of rights (Dang et al. 2017). There are also evidences that forest rights helped a number of local communities in Nepal and Mexico to participate in decision-making (Meinzen-Dick and Knox 2001).

Nevertheless, two unexpected negative impacts of property rights on actors' cooperation in forest devolution were observed. *First*, the allocation of property rights to a group of users might result in enclosures to individuals outside the group, who used to informally access to the resource (Meinzen-Dick and Knox 2001). A case study on forest devolution in the Central Highland of Vietnam showed that granting local actor's ownership over forests generated conflicts among local communities when the holders of rights excluded other actors over the use and control of the resources (Sikor and Tran 2007). *Second*, the right holders may have tactical behaviors in using forest resources. Dang et al. (2017) observed "the coping involvement" of forestry contractors in Vietnam's forest land allocation. These contractors mainly focused on their agricultural cultivation on the forest lands, insufficiently investing in forest planting and protection. Due to the high profits from rubbers, some LUCs holders even used their management rights to cut down allocated natural forests to plant rubber trees. These negative behaviors were associated with the conflicting objectives between the forestry sector focusing on forest rehabilitation and local participants getting involved mainly to get access to land for agriculture. These observations demonstrate that even though a lack of property rights may prevent local people from participating in forest management (Harrison 2003), a complete bundle of rights may not fully facilitate collective action in forestry if the users do not share the common objectives of forest devolution with the government (Dang et al. 2017). Conflicting objectives thus impede the mobilization of resources by forest users to protect and conserve forests. In this situation, external factors, such as agriculture development policies and the high profits from cash crops, exacerbate the problem (ibid.).

## Conclusion

This entry provides an overview of the three major challenges of forest devolution, a popular type of changing forest governance in the developing world since the late 1990s. It begins with a discussion of theoretical perspectives on forest devolution emphasizing collective action, property rights, and public participation. The collective action thinking resonates well with the call for a greater public participation in forestry. Both point to the necessity of local users' involvement to bring local knowledge's and local needs to the planning and decision-making of forest management. Property rights are considered critical to successful collective action and meaningful public participation in forest devolution because they provide users with great incentives to sustain forests and ensure their engagement in planning and decision-making processes. The entry then presents and discusses the three challenges for the transfer of forest use rights to local users/user groups. The first challenge regards to the gaps between forest devolution's rhetoric and practices, which highlight the governments' reluctance to allocate forest rights to user groups. Besides the concern about local people's ability to protect and use forests in a sustainable way, the main justification for this reluctance is forests, as a public good, should be managed for the benefit of the people as a whole. The second challenge relates to actors' conflicting objectives over the use and control of forest resources. This tension arises from a lack of meaningful public participation, which sidelines local users in policy-making and decision-making processes. The third challenge reflects the potential negative impacts of property rights on local participation in forest devolution. Without sharing the common objectives on forest management, users/user groups may employ the newly obtained property rights to exploit the forest lands for their own purposes, which may not be conductive to the protection and sustainable use of forests. Such users' opportunistic behaviors can be accelerated by external factors, such as policies for agriculture development and high market prices of agricultural products.

These challenges underline the following policy implications for forest governance (Dang et al. 2017). The potential negative impacts of property rights show that ensuring local users' cooperation in forest devolution involves more than merely granting them property rights. Since the lack of public participation exasperates these negative impacts, greater attention should be paid to the deliberation processes of forest devolution policy- and decision-making. Because of the high competition of other land uses with forest protection and conservation, these processes should be open to actors' reconciliation in their objectives for forest management. This competition also makes the collaboration of relevant land-use sectors in planning and decision-making critical to successful forest devolution.

# Challenges of Tax Administration Reforms in Nigeria

Mohammed Abdullahi Umar
Universiti Utara Malaysia, Sintok, Malaysia

## Synonyms

Tax administration reforms; Tax compliance

## Definition

Tax administration reform refers to changes in the structure and processes of tax administration with a view to improving tax revenue generation.

## Introduction

Scholars have established the fact that effective taxation is a key determinant of national development (Burgess and Stern 1993; Moore 2013; Besley and Persson 2014). While advanced countries have done a fairly good job of their tax systems, developing countries are still grappling with underperforming tax systems. The major policy thrust in response to this challenge has been tax policy and tax administration reforms. Since taxation is a major tool for economic development, it can be argued that tax administration is a major component of public administration. It is not surprising that it is receiving a lot of attention from multilateral agencies (World Bank, IMF, United Nations, OECD, etc.). However, despite over 30 years of tax administration reforms in developing countries, the problem of tax system inefficiency and inadequate tax revenue generation has persisted. The warning signal of the problem developing countries currently face in their tax systems appears to have been flagged up by Kaldor (1963). Kaldor stated then that advanced countries raise about 25–30% of their GNP in taxation while developing countries raise between 8% and 15%. He contended that developing countries will not be able to move out of their current state of underdevelopment unless they raise 15% and above of their GNPs. More recently, taxation Scholars (Burgess and Stern 1993; Moore 2013; Besley and Persson 2014) have drawn attention to the continued dichotomy of tax to GDP ratios between the advanced and developing countries. The authors also highlighted the ineffectiveness of the tax system as a key factor that has continued to make tax revenues low and unstable in developing countries in contrast to what is obtainable in advanced countries.

Narrowed down to Nigeria, the country deserves special attention in the tax administration literature. It is the country with the largest population in Africa and constitute about one-quarter of the entire sub-Sahara African region. The country has been unable to attain 15% minimum tax to GDP ratio set by the IMF and the 20% set by the

United Nations (Okonjo-Iweala 2014). Nigeria's immediate past minister of finance, Ngozi Iweala, puts current Nigeria's tax to GDP ratio at 7% (Okonjo-Iweala 2014). Cobham (2014) stated that Nigeria's tax to GDP ratio is one of the lowest in the world. Moreover, Nigeria deserves special attention in the literature because, for about a decade (2005–2015), the country has one of the fastest growing economies worldwide, yet, it has one of the lowest tax collection to GDP ratios. This is a puzzle that makes it necessary to examine the challenges of tax administration reforms after many years of concerted efforts by multilateral agencies and the countries tax administration authorities. It is obvious that tax administration reform is yet to have the desired impact on Nigeria's tax system and there is need to determine the factors responsible for its low impact and perhaps suggest novel policy response.

## Overview of Tax Administration Reforms in Developing Countries

### Tax Policy Reforms

Before examining tax administration reforms, it is important to briefly explain tax policy reforms as it was the precursor of tax administration reform. Tax policy can be viewed from macroeconomic and microeconomic aspects. The macroeconomic aspects deal with the level and composition of taxes while the microeconomic aspect deals with the design of the individual taxes. Prior to IMF's intervention in developing countries' tax policy, these countries largely depend on tax revenues from import and export duties and taxation of natural resources exploitation. They relied less on direct income taxes as incomes were lower compared to the advanced countries. Generally, the components of IMF's policy reform prescriptions are: reduction of trade taxes, reduction of the rates of personal income and corporate income taxes, broadening of the tax base, and implementation of VAT. IMF's tax policy reform package also included upholding the principle of neutrality by curbing distortionary exemptions that were widely ingrained in the tax systems of developing countries.

### Tax Administration Reforms

Perhaps, a decade of tax policy reforms through the 1980s revealed the inadequacy of the tax administration of developing countries. It dawned on the proponents of policy reforms that, after all, good policies would need to be implemented and the lot falls on tax administration. Bird (1989) pointed out that the centrality of tax administration in driving tax policy was noted as far back as 1958 by Stanley Surrey but was not taken seriously by stakeholders. He asserted that tax administrations in developing countries in the 1980s were neglected and archaic, characterized by poor training, low status, poor salaries, and poor equipment.

Expectedly, the World Bank and IMF championed the cause of tax administration reforms in their continued quest to improve tax revenue generation in developing countries. Key elements of tax administration reforms include: creating a unique taxpayer identification numbering system, simplifying tax rates and laws, making revenue authorities autonomous, leveraging on modern information technology, and staff training. Simplifying the tax system involves fewer taxes, fewer rates for each tax, fewer exemptions, and a broader base. The underlying thinking behind simplification of the tax system is that complex and opaque tax laws make the job of the tax administration difficult. IMF also asserted that simplifying the tax system leads to reduction in compliance cost. On autonomy, it will insulate the revenue agencies from the bureaucratic obstacles of mainstream civil service thereby allowing the flexibility needed to drive reforms.

### Assessment of Tax Administration Reforms

Tax administration reforms have featured prominently as part of economic development package handed down to developing countries after the Second World War. Carl Shoup's 1949 tax mission to Japan is believed to be the pioneering effort by the advanced countries to lift developing countries out of their tax revenue challenges. Hence, it could be inferred that attempts at tax reforms have been going on for about 60 years. The basic question this section seeks to answer is: how successful has tax reforms been in

developing countries? This question does not lend itself to a simple answer such as: successful or not successful. This is because, while tax reforms were implemented generally in many developing countries, the actual implementation and results are context-specific. Hence any attempt to give a generalized verdict must be done with caution. Luckily, many country case studies abound. Moreover, recent studies have attempted an assessment of the current state of taxation in developing countries (Moore 2013; Besley and Persson 2014; Fjeldstad 2014; Mascagni et al. 2014). An analytical and integrative review of these studies will serve as a basis of assessing the success or otherwise of tax reforms in developing countries.

Furthermore, any assessment of tax reform would need to look at the objectives the program set out to achieve prior to its implementation and how much it attains such objectives at post-implementation. Some objectives of tax reforms are as follows: revenue, redistribution, promotion of economic growth, tax simplification, and resource allocation. He stated that some countries set out to achieve one or a combination of these objectives while some of the objectives are incidental in the reform process. In assessing the success or otherwise of reforms in developing countries, this study will avoid the complications of an assessment based on all the aforementioned objectives. The criteria will be tax revenue adequacy as this is a crucial factor for development.

Despite positive assessments of the reform outcomes in some countries by those who were directly involved and other researchers, the impact of tax reforms in developing countries could, at best, be described as partially successful. Several points buttressed this position:

Firstly, the countries widely acclaimed to have improved tax revenue generation (Peru, Bolivia, Uruguay, Jamaica, Indonesia and others) are still left with much gaps to cover in their tax ratios. They are still very far behind the advanced countries in terms of tax ratio.

Secondly, the successes recorded by tax reforms in some developing countries appear not to be all-encompassing. Reform-driven revenue performance revolves around a single source of revenue – VAT in most countries. Income tax which generates much revenue in the advanced countries remained resistant to reforms in developing countries. Even countries that raise some measure of income tax do so from the relatively easier corporate income tax while personal income tax remained elusive (Fjeldstad 2014). The advanced countries attain revenue adequacy by effectively taxing a wide array of taxes and not by hanging on to a seemingly life-support of a single tax. More successful tax reforms would therefore need to broaden the tax base of developing countries.

Thirdly, the partial success of tax reforms in developing countries has been difficult to sustain. Cases abound where tax revenue generation goes up drastically in response to the urgent pressure of reforms but declined sharply when they urgent tempo goes down. Everest-Phillips (2010) stated that the so-called rise in revenues attributed to reforms was actually caused by the authorities tightening their squeeze on existing taxpayers and not from a broadening tax base as anticipated.

Fourthly, many developing countries have taken doses of the prescribed tax reforms but appear to be far away from attaining adequate tax revenue generation. Ironically, some countries witnessed a decline in tax revenue generation after the reforms while other countries outrightly could not implement the reforms due to taxpayer resistance and at times resistance from within the tax administrators who benefits from the status quo.

Fifthly, on a general note, decades of tax reforms and significant improvement in tax revenue generation in developing countries still leaves much gap uncovered. Concern about domestic revenue generation remains top of the global agenda for developing countries. The 2015 Millennium Development Goals (MDGs) have passed with many developing countries failing to attain the set target. Recently, OECD classified about 50 developing countries as fragile states alluding to their inability to generate adequate tax revenue as largely responsible for their near-failure. Surprisingly, some of the countries on the fragile list have been struggling through decades of tax reforms. Moreover, taxation researchers

have continued to express concerns about the low tax ratios of developing countries (Burgess and Stern 1993; Moore 2013; Besley and Persson 2014; Fjeldstad 2014) over 50 years of after Kaldor's (1963) initial expression of concern. Based on the above points, this study argues that tax policy and administration reforms are yet to have adequate impact on the tax systems of developing countries.

## Tax Administration Reforms in Nigeria: Challenges and Possible Solutions

Similar to other developing countries, Nigeria's tax administration has passed through series of reforms in the past 20 years. Following the general principles of tax reforms, Nigeria's tax administration has been operating a computerized list of taxpayers each with a unique Taxpayer Identification Number (TIN) since 2008. The country's tax administration has also enjoyed a semiautonomous status similar to its counterparts in other developing countries. It has computerized its operations and embark on series of taxpayer services including awareness creation.

Despite these and many other reforms to tax administration in the country, tax revenue generation remains very low and challenging. The major problem facing the tax system in Nigeria could be tax compliance. For instance, the country's immediate past minister of finance, Okonjo-Iweala, stated that about 65% of registered firms in Nigeria have not been paying income tax while about 75% refused to register (Okonjo-Iweala 2014). This is a serious statement coming from the highest authority. Similarly, the immediate past Minister of Finance, Dr. Ngozi Iweala, disclosed at a World Bank forum in Washington, DC that 75% of registered firms are not in the tax net. Furthermore, the problem of tax collection in Nigeria is expressed strongly by the International Monetary Fund (IMF). IMF (2015) acknowledged the phenomenal growth in the Nigerian economy and highlighted the expanding base of services and manufacturing. It however noted that the country is yet to collect tax revenue from this growing economy and that the major problem is tax compliance. Admittedly, there are numerous problem facing tax administrations in Nigeria some of which include multiple taxation, low level of technology deployment, complexity, and outdated tax laws. However, this entry argues in line with IMF (2015) that tax noncompliance could be the major challenge. This position is supported by the tax noncompliance statistics that has been given by the country's tax authorities over the years. While tax noncompliance is present to some extent in all countries, including the advanced countries, the Nigeria case where about 90% noncompliance exist in some sectors such as the self-employed is indeed unique. Tackling this herculean challenge could pave way for higher tax revenue generation.

## Conclusion

This entry was motivated by the gross inadequacy of tax revenue generation in Nigeria despite decades of tax administration reforms. The entry argues that though developing countries generally face a lot of challenges in generating tax revenues, the Nigeria case is unique. This assertion is supported by Cobham (2014) who described the country as having one of the lowest tax to GDP ratios in the world. As noted by IMF (2015) and supported by tax noncompliance statistics from Nigerian finance authorities, this entry also argues that tax noncompliance may be the major challenge facing tax administration reforms in spite of many other challenges. The key message of this entry is that tax administration reform may not have the desired impact unless taxpayers willingly comply with their tax obligations. This message holds a very important lesson for the Nigerian government, governments of other developing countries, and multilateral agencies that support tax administration reforms. As noted by Jenkins et al. (2000), the amount of tax revenue generated by any country depends on the tax base and tax rate multiplied by the compliance rate. The implication is that, no matter how large is a country's tax base and how high its tax rate, it will not generate adequate tax revenue without a commensurate high rate of compliance.

Additionally, tax administration reforms may lead to efficiency in tax administration. However, unless the taxpayers themselves are pleased with the reforms and unless they comply, tax administration will fail to generate adequate tax revenue. The lesson for tax administration reformers is that taxpayers must be keyed into all aspects of tax administration reforms. The present system in which tax administrations are equipped with information technology tools and with well-trained staff may not translate to adequate tax revenues unless the taxpayers themselves are persuaded to buy into the reforms and willingly part with their tax monies. As noted by Umar et al. (2017), in their interviews with self-employed taxpayers in Nigeria, one of the ways to co-opt tax payers into tax administration reforms is to adequately engage them. Tax administration reforms without reforming the taxpayers may not achieve the desired impact. This is the key lesson from the Nigerian case.

# Challenges to Inter-organizational Collaboration: Examining US Stabilization Efforts

Brett C. Doyle
George Mason University,
Falls Church, Fairfax, VA, USA

## Synonyms

Conflict mitigation; Networked governance; Stabilization; Third-party governance

## Definitions

| | |
|---|---|
| Networks | are defined as consisting of multiple organizations that are legally autonomous. |
| Stabilization | is defined as are conducted to end or prevent the reoccurrence of |

violent conflict through creating the conditions for nonviolent political and economic development. This can include activities to reduce ongoing violence, as well as preventative efforts to forestall a resurgence of conflict.

## Introduction

Collaborative governance networks have become known as means for organizations to collectively address problems. However, collaborative governance approaches are not always fully successful, and a better understanding of how their challenges can frustrate success could help inform public managers about how best to approach working within them. The United States' experiences in attempting to end conflict-driven violence and bring stability in places such as Iraq and Afghanistan present themselves as areas in which to study collaboration challenges. Though collaboration does not guarantee success, insufficient collaboration can ensure failures, which was seen in numerous reviews of US activities. Hundreds of millions, if not billions, of dollars in reconstruction assistance have been described as wasted, in part due to lack of coordination.

To understand more about the collaboration challenges in efforts to reduce conflict and why they may persist, US efforts were examined as collaborative governance networks. In this context, US stabilization activities can be viewed as emergent problem-solving networks or networks that are formed to help managers set policy for a critical or emerging problem (Milward and Provan 2006). Cases of US collaborative governance networks were examined in the stabilization efforts in Iraq (2003–2011) and Afghanistan (2001–2014), the conflict-afflicted region of Mindanao in the Philippines (2002–2014), and the efforts to mitigate conflict in South Sudan (2011–2014). These cases included the largest efforts at promoting stability in recent history in Iraq and Afghanistan. The Iraq and Afghanistan cases were narrowed to focus on two subject areas: US efforts at the provincial level, which often included combined US civilian and military teams, local governments and civil society groups, and sometimes other international partners, and US efforts in the area rule of law (RoL) support, which entailed "courts, cops, and corrections" focused activities.

## Characterizing Network Collaboration

Based upon the network map and collaboration evaluation conducted as described above, the highest level to which the networks in the cases seemed to be regularly functioning was determined across the various categories of organizations. This was done through the Agranoff typology, which categorizes collaborative networks based on a hierarchy of interaction (Agranoff 2003):

- Informational networks in which participants come together exclusively to exchange agency information and any actions taken are purely voluntary.
- Developmental networks in which information exchange is combined with education and member services that increase the capacity to implement solutions.
- Outreach networks in which participants share information, build capacities, sequence activities, pool resources, and develop new implementation options.
- Action networks in which participants adopt collective courses of action.

Collaboration was examined among with the categories of organizations, including host nation governments, international organizations, international and local NGOs, and US civilian and military organizations. This involved generally characterizing collaboration between these categories of organizations. (The research did not include combat-oriented collaboration, such as military-to-military efforts to build security forces. Further, evaluating the ultimate success

of stabilization or conflict mitigation was outside the scope of this research.)

Across these cases, the only identified instance of an informational network was seen in the Afghanistan Provincial case, between the US organizations (both military and civilian) and NGOs. NGOs, particularly humanitarian NGOs, had contentious relationships with the US (and other international military partners) civilian and military organizations (Dziedzic and Seidl 2005).

Developmental networks were the most commonly observed level of network across the cases. This was consistently seen with the United States and other donor states, international and local NGOs, international organizations, NATO, and United Nations, and among those organizations collectively. The sole instance of a developmental level of collaboration between the US civilian and military was seen in the Afghanistan RoL case, where there was a general clash over who was in charge or who could do what in the area of RoL. Though not always smoothly functioning, community capacity development occurred through the sharing of best practices, pooling of some resources, and sometimes training or combined workshop events in these networks. Organizations also frequently coordinated to avoid duplication and to allocate resources more efficiently (South Sudan Interview 27 October 2013).

Collaboration between US civilian and military organizations, with the aforementioned exception of the Afghanistan RoL case, was generally at an outreach level by the end of the case periods, even if they did not initially begin there (Dempsey 2009). The US civilian and military relationships generally operated with mutually understood areas of activity, shared strategic goals and objectives, and by at least staying out of each other's way (i.e., "deconflicted"), if not actually routinely complimentary project activities, by the end of the cases. Cases of very difficult relationships were described as "not the norm," but they did exist (Afghanistan Interview 23 Jan 14; Iraq Provincial Interview 5 Mar 14; Yodsampa 2011).

## Frustrated Action Networks

In many cases, there was a clear desire for an action network level of collaboration between the US civilians and military (particularly by the latter organization). However, where US civilian and military collaboration seemed to break down was at the highest level of activity of shared decision-making, particularly regarding those decisions that involved directing resources. Inflexible funding sources proved to be a barrier for shared decisions, even when the proper motives were present (Emerson et al. 2012). Further, though shared activities were common, a firm limit to the desire to collaborate was seen where such collaboration would put an organization's own mission at risk. It was also not clear if US civilian organizations had the discretion necessary from Washington, DC, headquarters to make these kinds of decisions regarding funding (Fritsch 2012). As a result, US civilian and military collaboration predominately remained at an outreach network level.

## Insecurity Drove Collaboration Instability

The review of collaboration in conflict environments begs the question of why consistent, high-level collaboration seemed so difficult to attain and sustain. Across the cases, the pervasive risks of violence were ever present and drove protective behaviors to mitigate risks (Insecurity also created a toxic environment for accountability of partner projects and activities, as staff could not always travel to projects for site visits or to verify information coming from implementing partners.). Many of these measures, however, created challenges for developing collaborative relationships. Additionally, staff turnover, ultimately arising from the hostile environment, was seen as a challenging issue that spanned all cases. Within the case studies, substantial impacts to these enabling network features from security and turnover were identified.

### Security

With the greatest pervasiveness of violence, the impacts of security in Iraq and Afghanistan could generally be viewed as "nothing was easy," and activities seemed to take as much as two or three times as long to accomplish as they might elsewhere (Iraq Rule of Law Interview 27 Apr 14). Overall, security-related challenges to travel and communications made contacts and information sharing with partners more costly (in terms of time and energy). This delayed or outright prevented the development of relationships and fostered a reliance on indirect coordination. Moreover, the hostile environment created risks for collaboration and fostered an atmosphere of heightened tension and distrust that created barriers, delaying the creation of working relationships.

Spikes in violence could greatly impact strategic priorities, rapidly undermining plans and derailing efforts at stabilization and adding to the challenges mentioned above. This instability was particularly detrimental to senior level or "top-down" efforts to improve collaboration across organizations. In a network context, strategy and priority changes were likely to have a cascading effect; with major changes each network participant needed to not only internally rapidly re-prioritize but also immediately needed to adapt to all of the other network participant's respective changes (Table 1).

**Challenges to Inter-organizational Collaboration: Examining US Stabilization Efforts, Table 1** Security impacts

| | |
|---|---|
| Coordination and strategy | Rapid changes to priorities<br>Additional coordination requirements |
| Knowledge management | Administrative burdens to access information<br>Security risks limiting willingness to share |
| Relationships | Challenges to access and engage partners<br>Delays in forming relationships |

### Staff Turnover

Staffing turnover was most severe in the Iraq and Afghanistan cases. There, due to hostile and austere working environments, international personnel typically resided in-country for a year or less (-Fritsch 2012). Efforts were made to increase continuity across rotations; however, they did not fully mitigate transition issues. In Mindanao and South Sudan, the pace of tour rotations was somewhat less rapid, with many international staff staying for 2 or 3 years (Mindanao Interview 1 July 2015), though in Mindanao US military tours could be 6 months or a year, and in South Sudan, US civilians shared the 1-year tour practices seen in Iraq and Afghanistan (South Sudan Interview 19 October 2013). In all cases, host nation counterparts, though not bound to the frequent rotations that US and international personnel maintained, could still leave positions, either from threats, acts of violence, or through normal turnover, such as after elections (Iraq Rule of Law Interview 27 Apr 14; Meyerle et al. 2010).

Staff instability disrupted relationships, and redeveloping relationships took time and became a constant drag on the pace of conflict mitigation efforts (Linden 2002). This high turnover and regular relationship forming was exhausting for local partners as well (Iraq Interview 17 Sep 13). Further, turnover could slow the pace of efforts as new staff were commonly described as needing months of time to gain working knowledge of their environments (Afghanistan Interview 12 May 14). This was described as a pattern of learning the job for the first 2–4 months, working for 4 months, and then checking out (preparing to depart) (Naland 2011; South Sudan Interview 27 October 2013; Yodsampa 2011). Leadership turnover was seen as particularly detrimental. Common plans and goals could be reset as new leaders frequently brought new priorities (Mindanao Interview 1 Feb 2014). Multiple changes in leadership contributed to instability in vision and direction as well as leading to less-focused and inefficient efforts (Naland 2011). Frequent turnover was also seen as creating volatility in agreements between parties.

**Challenges to Inter-organizational Collaboration: Examining US Stabilization Efforts, Table 2** Turnover impacts

| | |
|---|---|
| Coordination and strategy | Difficulties in fostering mutual understanding<br>Instability in priorities<br>Negative signals to partners |
| Knowledge management | Loss of institutional knowledge<br>Productivity loss to relearning<br>Limitations to assessing trends |
| Relationships | Continually rebuilding relationships<br>Loss of productivity |

With every turnover, there was a loss, sometimes steep, of institutional knowledge (Iraq Interview 5 Mar 14). The high turnover of staff in host nation governments resulted in weak institutional memory, thus necessitating continued and costly "capacity building" with few tangible programming results (Schomerus and Allen 2010). Turnover also hindered the ability to understand and address issues with impacts longer than the typical tour cycles, such as for analyzing and interpreting performance data for programs (Afghanistan Interview Nov 2013; US Government Accountability Office 2014) (Table 2).

### Interrelated Impacts

Taken together, an interrelation between security and turnover impact on collaboration can been seen. Security challenges were seen as driving rapid staffing turnover, gaps, frequent trips abroad, and an inability to attract and retain staff. Staff instability necessitated adjustments, if not re-establishments, of collaborative patterns. Adjustments between collaborating organizations could have impacts that organizations across the network would need to adjust to, creating a ripple effect. Simultaneously, security needs created challenges and delays to relationship development and knowledge management, both of which were substantially affected by tour rotations. The security challenges to relationship building drove up the time and costs needed to build them in the face of already frequent staff changes. Both the security environment and staffing turnover were also seen as leading to instability in strategy and priorities.

## Conclusion

### Theory of Unstable Networks: Perpetual Emergence

Overall, the insecure environment acted as an engine of disruption, preventing the development of stable, higher functioning collaborative governance networks. The striking instability of these networks is consistent with a developing emergent problem-solving network. However, emergent problem-solving networks should mature into designed problem-solving networks over time (Milward and Provan 2006). Though overall collaboration generally improved, at no point did the networks "stabilize." Given that cases spanned several years or even more than a decade, these networks can effectively be described as perpetually "emergent."

Although there was collaboration and an overall trend of improvement was seen in the case studies, ultimately the perpetually emergent networks examined here failed to stabilize themselves and were frustrated in producing the levels and consistency of collaboration that participants desired. Network instability likely limited the ability of managers to identify the necessary developments as well as to make and solidify the agreements necessary to support greater collaboration. The network instability further impeded senior leaders from developing any understanding of on-the-ground realities and the urgent necessity for changes (Yodsampa 2011).

# Changes in the Model of Municipal System in Russia

Shubenkova Alexandra
Laboratory for Political Studies, National Research University Higher School of Economics, Moscow, Russia

C

## Synonyms

Local autonomy; Local governance; Local self-governance; Lowest tier of public administration; Municipalities; Russian Federation

## Definition

Local self-governance in Russia is the lowest tier of public administration, which empowers citizens to decide issues of local significance, within the limits of its authority, by local bodies of power, and through direct participation.

## Introduction

After the dissolution of the Soviet Union in 1991, Russia adopted the Constitution of the Russian Federation in 1993, ratified the European Charter of Local Self-Governance, and introduced comprehensive local legislature. Initially high level of local autonomy was progressively limited within a wide-scale local reform of the mid-2000s. Regional and federal authorities received the power to decide on the design of local political system, configuration of local political elite, and the amount of municipal responsibilities and resources. The ultimate changes were implemented by constitutional amendments in 2020, which inbuilt municipal system into the political power vertical in Russia.

## General Characteristics of Local Self-Governance

The contemporary stage of Russian local self-governance started with the dissolution of the

Soviet Union in 1991 and manifested itself in the adoption of the Constitution of the Russian Federation in 1993 and of three federal laws in 1991, 1995, and 2003 (see in References). Though Russia approved the relevant legal framework, until 2003, models of local self-governance remained weakly framed and highly diverse. The contemporary organization of local self-governance in Russia was merely formed within the municipal reforms of the mid-2000s. In 2003, the national authorities approved the cornerstone Federal Law "on the general principles of organization of the local self-governance in Russian Federation" 131-FZ (FZ – an acronym in Russian to federal law) dated October 6, 2003 (further in the text – 131-FZ 2003). This law provided a comprehensive framework for local self-governance. However, the system, initially introduced by 131-FZ, did not remain for long. Since its adoption until now, the federal law has been amended over 150 times, progressively expanding political and budget authority of the federal center and regions over local self-governance. The ultimate changes were implemented by constitutional amendments in 2020. This section aims at describing the current model of local self-governance in the Russian Federation and tracking its major changes since 1993.

At this moment, local self-governance in Russia formally occupies the lower level of the three-tier system of federalism. From the normative perspective, local self-governance in Russia is protected by the Constitution of 1993 and international obligations of Russia following the signing and ratification of the European Charter of Local Self-Government in 1998. In Article 12 of the constitution, Russia recognizes and guarantees local self-governance, claims its independence within the limits of its authority, and states that "the bodies of local self-governance shall not be part of the system of bodies of state authority." Additional emphasis on the right of citizens for local self-governance is provided in Chap. 8, Articles 130–133, of the constitution. In compliance with the principles of the independence of local self-governance, the framework of 131-FZ states that local self-governance is one of the foundations of the constitutional regime in Russia (Article 1). It comprises a form of the exercise of power by the people, which allows people to resolve problems and questions of local importance independently and take responsibility both directly and indirectly through the bodies of local governance.

From the institutional perspective, local self-governance in Russia possesses the right to establish its own legislative and executive bodies of power, have sources of income and areas of authority, decide on its budget and strategic development, and have a protected legal status. But, since the early 1990s, the extent of the full-fledged authority of, and the resources allocated to, local self-governance decreased over time. These changes seriously diminished the independence of local self-governance, which makes the expert community highly critical in the evaluation of its actual status as a separate layer of authority.

So far, Russia consists of 85 regions and totals around 155,500 settlements, with a prevailing number of rural settlements (153,100 settlements). Municipal entities are established to provide public services in all these settlements. The latest official number of municipal entities in Russia, provided by the Ministry of Justice (Ministry of Justice report 2020), states that, as of July 1, 2020, Russia comprises 20,354 municipal entities of 8 different types. Along with some international trends, the number of municipal entities in Russia has decreased over time. According to the Federal State Statistics Service Rosstat, in 2008, local self-governance systems numbered 24,151 municipal entities, with a decrease to 23,001 by 2013 and then 21,946 by 2018 and 20,846 by January 2020.

## Types of Municipal Entities and Their Development

As of 2021, federal law 131-FZ acknowledges eight types of municipal entities. The general overview of the eight types of municipal entities and their number is reported in Table 1. Hereby the translations from Russian differ from some of those used in the Council of Europe (The

[a]For municipal entities of the lower level, the number in brackets indicates which municipal entity it forms; for municipal entities of the upper level, the number in brackets indicates which municipal entities it unites
[b]The type of municipal entity was introduced into 131-FZ in 2014
[c]The type of municipal entity was introduced into 131-FZ in 2019

Congress of Local and Regional Authorities of the Council of Europe 2019). The types are as follows (Article 2, 131-FZ):

1. Rural settlement (selskoe poselenie, сельское поселение) – one or more commonly shared territory of small rural settlements, such as village, khutor, etc.
2. Urban settlement (gorodskoe poselenie, городское поселение) – a city or a town.
3. Municipal rayon (municipalnyi rayon, муниципальный район) unites several settlements with surrounding territory between them, also called an intercommunity territory (mezhselennaya territoria, межселенная территория)*.
4. Municipal district (municipalnyi okrug, муниципальный округ) unites several settlements which do not have any municipal status but share one territory.
5. Urban district (gorodskoi okrug, городской округ) is one or several settlements which do not have own municipal status, share one territory, and have a level of urbanization over two-thirds of population.
6. Urban district with intracity division (gorodskoi orkug s vnutrigorodskim deleniem, городской округ с внутригородским делением) is an urban district which contains inner-city rayons as intracity municipal entities, established by the discretion of regional law.
7. Intracity rayon (vnutrigorodskoi rayon, внутригородской район) – intracity municipal entity. A city territory is divided into intracity rayons by regional law and a statute (ustav, устав) of an urban district with intracity divisions.
8. Intracity territory of a federal city (vnutrigorodskaya territoriya goroda

federalnogo znacheniya, внутригородская территория города федерального значения) – a municipal entity organized on a part of a federal city territory.

*Intercommunity territory (mezhselennaya territoria, межселенная территория) is a territory of a municipal rayon outside boundaries of settlements, which does not form a municipality. A settlement which has less than 100 residents and decides on amalgamation with another municipality becomes an intercommunity territory within this municipal entity.

As illustrated by Table 1, the wane of the number of rural and urban settlements was a visible outcome of the wide-scale municipal reforms in Russia. Urban districts and newly established types of municipal entities (lines 4, 6, and 7 in Table 1), on the contrary, increased in number. Other four types of entities reduced in number by up to 13%. The number of all municipal entities dropped by 11%. The number of municipal settlements (poseleniya) reduced by 13%, and the number of rural municipal units (selskie poseleniya) reduced by 12%. This phenomenon is explained by the fact that rural municipal entities were actively merged into larger municipal entities, i.e., municipal rayons. Sometimes, 1 municipal rayon amalgamated up to 20 rural settlements.

Some municipal entities, on contrary, increase in number. Some municipal entities, on contrary, increase in number. Thus, the growth in the number of intra-city territories of federal cities is caused by two things. First, in 2011–2012, through an urban reform, Moscow merged 21 additional municipalities from the Moscow region. Second, since the annexation of Crimea in 2014, Sevastopol is administered as a third federal city, constituted by ten municipal entities. Despite the fact that the status of Crimea as a region of Russian Federation remains unrecognized internationally, after its annexation from the Ukraine in 2014, Russian statistics accounts the region in its official data (Federal constitutional law № 6-FKZ 2014). Another increase in number refers to municipal districts, which were introduced in 2019 (Federal Law № 87-FZ 2019) and actively merged small settlements into a one-tier municipal entity. From the economical perspective, massive reorganizations by type among municipal entities was merely driven by an intensive internal migration after the collapse of the Soviet planning economy, leading to depopulation of some areas with concentration in others. The economic downturn in depressive agricultural and industrial settlements led to depopulation, due to residents' migration for a better job market and better social services (Molyarenko 2021).

Throughout the reforms, the system of local self-governance in Russia drifted between one-tier and two-tier systems. Until the start of the local reform in 2003, Russia had a two-tier local system, with local entities of the upper level (rayons, cities, settlements, intracity municipal entities of the cities of federal distinction, and municipal entities which united rural settlements) and the lower level (intracity rayons, settlements, rural districts, etc.). Now, the local system combines the existence of both types of municipal entities. The two-tier entities are represented by urban districts with intracity divisions (introduced in Federal Law № 136-FZ 2014) and municipal districts (introduced in 2019). The two-tier municipal entities are organized as a nested "matryoshka" doll: lower-level municipal entities, located in neighboring territories, can be merged into upper-level municipal entities. However, it does not constitute an amalgamation. Within municipal boundaries, people continue executing self-governance directly and (or) through elected and other bodies. Both levels preserve their own bodies of local self-governance and own spheres of authority. The municipal entities of the upper level deal with the questions of common interest to the municipal entities that it unites and which cannot be resolved by the lower-level entities. Formally lower and upper levels are not subordinated, but pressure from the latter is possible through different instruments, primarily through budget allocation procedures.

While leaving the right to decide on the type of municipal entity for regional and local levels, 131-FZ establishes some eligibility criteria which an entity should meet. Such clarifications

are supposed to simplify decision-making regarding the organizational form of an entity for the regional and municipal levels of power: whether it should be a one- or two-tier model. For instance, urban districts should meet three criteria: the level of urbanization is higher than two-thirds of residents, the urban territory comprises not less than one-third of the municipal area, and the density of population is five or more times higher than the average Russian density.

In practice, local self-governance in Russia is highly asymmetric. Some regions have less than 20 municipal entities on its territory (such as 9 in the Magadan region and 18 in the Sakhalin region), while others have around 900 entities (895 in the Republic of Bashkortostan and 956 in the Republic of Tatarstan). Regional discrepancies also exist in the number of municipal entities of each type per region. Certain types of municipal entities do not appear at all in some regions. The number and types of municipal entities existing in a region generally depend on various factors, such as the density of population, local historical background, geographical location, level of urbanization, administrative traditions, etc.

Another asymmetry manifests itself in the significant variation of municipal entities by area and number of population. Thus, according to the Ministry of Justice [2020 for State Duma], municipal areas vary from 0.23 $km^2$ to 336,400 $km^2$ per entity. The population in the smallest Russian municipal entity counts 15 residents (rural settlement Oskoba in Krasnoyarsk Krai), with almost 1.6 mln residents in the largest municipal entity (urban district Novosibirsk). Among entities of the same type, a significant discrepancy in number of residents also exists, by up to 1,000 times. For instance, the abovementioned report from the Ministry of Justice states that the population of the largest urban district, Novosibirsk, is 939 times bigger than in the smallest municipal entity of the same type (Ostrovnoy in the Murmansk region). And the population of the intracity territory of a federal city (Maryino in Moscow) is 904 times bigger than the smallest entity of the same type (Serovo in Saint-Petersburg). The administrative status of a regional capital does not do much to equalize municipalities: the largest regional capital (Novosibirsk) has a 132 times bigger population than the smallest regional capital (Magas).

The asymmetry of municipal entities by population and area makes municipal residents seriously unequal in their representation in the bodies of local authority and citizens' access to local self-governance. Thus, despite the drastic difference in population by type of municipal entity and average quantity of deputies in a representative body, municipal entities vary from 9 deputies in a rural settlement to 45 deputies in an urban district with an inner-city division.

## Constitutional Status

Article 12 of the constitution, and the European Charter of Local Self-Governance, protects independence of local authority aside from "state power" of the Russian Federation. However, despite the constitutional guarantees, the recognition of the autonomy of local self-governance is strongly challenged nowadays.

In 2020, constitutional amendments introduced a novel placement of local self-governance in the Russian political system. The revisions to Articles 131 and 132 stipulate that local self-governance comprises a part in the "unified system of public power" (edinaya systema publichnoi vlasti, единая система публичной власти), without clarification of the broad term "public power" and how it differs from the "state power." The term "public power" is incorporated into the constitution six times (Articles 67, 71, 80, 83, 131, and 132 of the constitution), consecutively stipulating that "public power" is "under the authority of the Russian Federation" (i.e., comprises a sphere of federal responsibility); that the President provides concordant functioning and interaction of the bodies of *public power*; that peculiarities of *public power* can be defined by federal law in federal cities, regional capitals, and other territories; and finally, that local self-governance, along with the bodies of state power, organizes the *unified system of public power*. Thus, the newly amended Articles 131 and

132 insert local self-governance into the "unified system of *public power*," regulated by federal law, which can be interpreted as a loss of local autonomy (Teague 2020).

Following the constitution amendments of 2020, the notion of local self-governance in Russia is in a state of contradiction. Until further clarification of the terms, local self-governance is, de facto, located under the control of federal and regional decisions, especially in "federal cities, regional capitals, and other territories," which conflicts with Article 12 of the constitution, which announces the independence of local self-governance. Hence, to resolve the conflict on the normative level, clarification is needed on how the fundamental principle of independence of local self-governance from *state power* intersects with the novel term of *the unified system of public power*. These legal clarifications are expected in the last spring session of the seventh term of the State Duma in 2021 and the new eighth term of the State Duma, which will be elected in Russia, in September 2021.

## Functions and Responsibilities of Local Self-Governance

In 2019, the Congress of Local and Regional Authorities of the Council of Europe monitored the implementation of the European Charter of Local Self-Government in Russia. In its report, the Congress declared "a low share of public affairs under the own responsibility of local authorities, [...] and the unclear division of competences between different levels of government" (The Congress of Local and Regional Authorities of the Council of Europe 2019). The development of the Russian legal framework corresponds to this external evaluation. Chap. 3 of 131-FZ names the functions which are executed by local self-governance in Russia. Federal and regional laws provided an additional lengthening of the list of functions depending on the regional and local context. Municipal entities are responsible for issues of local significance but also might receive additional functions from the federal and regional levels of power.

The general direction of local reforms in Russia expands the powers of regional authorities in the municipal sphere, reducing the area of authority of municipal entities themselves. Initially, local self-governance of the early post-soviet period had the responsibility for a wide sector of social services. Studies reconstruct (Molyarenko 2021) that, in the 1990s, the newly organized post-soviet federal government intentionally delegated wide social responsibilities to the local level due to the lack of resources to provide these public services in a centralized manner. The 1995 law 154-FZ, in Article 6, delegated a wide authority to the local level in the provision of all key functions and policies. However, following the post-soviet centralization in Russia, many municipal entities were excluded from the main part of social policies, such as healthcare or child welfare. In some places, federal and regional levels delegated the execution of these functions to the local level, but for a short time.

The asymmetric proliferation of types of municipal entities in Russia is accompanied by significant variations in how functions are allocated to various municipal entities. The law of 1995 equally allocated 30 functions to the responsibility of municipal entities of all kinds. Then in 2003, 131-FZ differentiated the quantity of functions, depending on the type of municipal entity. Initially, in 2003, settlements were responsible for 22 questions, municipal rayons for 20, and urban districts for 22. In further amendments, 131-FZ increased the list of local responsibilities twofold to 40, 38, and 45 questions, respectively. All types of municipal entities, except the intracity territory of a federal city, are responsible for 14 general functions, such as the approval of a charter, the organization of elections, etc. Municipal rayons and urban settlements are responsible for an additional 39 local issues, rural settlements for 14, etc. The profile of obligations may vary, even in a group of entities of the same type: for instance, federal cities differ in the amount of executed responsibilities. Municipal entities in Moscow are responsible for 24 basic questions, in Saint-Petersburg for 43, and in Sevastopol for 12. Additionally, Moscow and Saint-Petersburg

have separate lists of responsibilities, delegated to only some of their constituent local entities.

The increase of the number of functions executed by municipal entities should not be treated as the expansion of their authority. The rise of the number of local functions is part of another strategy. The legal reforms of the 2000s were driven by the need to balance the drastic contrast in living standards across the country and to unify local legislation. In 1995, 154-FZ stipulated broad, non-specified functions, which were distributed to the local level, like primary education, healthcare, and communal infrastructure services. As illustrated in Molyarenko (2021), in the 1990s, economically depressive municipal entities could not provide their citizens even the lowest level of services in education, housing, or healthcare. In 131-FZ and its further amendments, the law listed more specific and narrow functions, while broad functions, such as education and healthcare issues, were progressively excluded from the local authority. Local reforms were designed to equalize the level of service provision in municipal entities and did this through reshaping and reducing their area of power. As illustrated in Molyarenko (2021), in 2011, responsibility for the healthcare system was given to the regional authorities. In 2014, responsibilities of rural settlements were delegated to the municipal rayons. Since 2019, municipal entities have progressively transferred responsibility for waste management to the regional level. Finally, the introduction of two-tier municipal entities in 2014 and 2019 led to a new wave of centralization in local budgeting, as enlarged upper-level entities tended to reserve their funds for municipal centers.

The list of functions executed by municipal entities significantly varies among regions and municipal entities, as functions can be redistributed in several ways between federal, regional, and local levels. In concordance with Articles 5 and 6 and Chap. 4 of 131-FZ, by its origins, local functions are categorized as follows: local issues (or in direct translation, "questions of local significance"); rights of bodies of local self-governance; delegation of national public functions – delegation directly or through a subdelegation by the regional authority; delegation of regional functions; redistribution of functions; and redistribution of functions through bilateral agreements of municipal entities. The number of municipal entities involved in function distribution was 3,808 in 2019 (17.6% of the sample) and increased to 4,231 in 2020 (20.3%).

Basically, local authorities are responsible for issues of local significance, i.e., the provision of services essential for daily local processes. These services include the development of local budgets; city territorial planning; decisions on local taxes; the disposal of local property; the provision of electricity, heating, gas, and water to residents; local road monitoring; parking space management; local transportation; cultural entertainment; youth policy; public order and municipal police; the improvement of public spaces, funeral services, cemeteries; etc. Local self-governance is also responsible for the housing of vulnerable social groups and for local libraries and cultural objects, the provision of fire safety, emergency management, waste management, and archives. Upper-level municipal entities are also responsible for public preschool, primary and secondary education, and healthcare. Municipal entities can establish their own municipal and intra-municipal mass media. The separate attention of local authorities is addressed to the issues which are traditionally attributed to the federal policies. Since 2005, several amendments to 131-FZ introduced additional responsibilities of local self-governance for the prevention of terrorism and extremism, national and confessional peaceful cohabitation, migration policy and migrant integration, the prevention of intranational conflicts, and the provision of energy efficiency. This list of functions covers only so-called local issues (questions of local significance).

The transfer of functions and responsibilities within the three-tier federal system is performed via the three procedures: delegation, distribution, and subdelegation. Delegation means an obligation to provide financial resources needed to implement these functions, while the distribution does not imply such obligation. Subdelegation means the delegation of the functions by the regional level to the municipal level, while the regional level itself receives them from the federal

level. There is no single scheme of deciding which functions should be delegated, distributed, or subdelegated: the decision is left up to federal and regional political actors. This mechanism increases financial discrepancies among municipal entities in terms of financial sustainability and self-sufficiency.

Among national functions that are delegated to the municipal authorities are primary military registration, civil registration, the organization of the all-Russian census, notary services, etc. The rate of local involvement in national function provision differs across the country. According to the Ministry of Justice (2020), in 2019 17,132 municipal entities executed primary military registration (82.1% of the number of municipal entities which participate in the budget process), 7,539 municipal entities provided notary services (36.1%), and 1,612 entities provided civil registration (7.6%). Additionally, the rate of involvement of municipal entities in federal services provision has changed across time. In 2019, a higher number of municipal entities provided notary functions (39.1% of all municipal entities) and the registration of births, deaths, and marriages (11.1%).

Regional freedom to subdelegate functions (i.e., to delegate the functions they received from the federal level) to the local level is wide, but not universal. Out of all regional functions, 94 out of 114 can be subdelegated to the local level. In 2020, 3,100 municipal entities executed subdelegated regional functions (15.1% of the number of municipal entities which participate in the budget process). The variety of functions delegated by regions to the local level is diverse and depends on the context. Sometimes regional authorities delegate responsibilities for healthcare, education, children's recreation, labor protection, road construction, local public transport, utility tarification, and social support to some vulnerable groups, such as orphans, the retired, and the handicapped. For instance, in 2020, 40.4% of municipal entities were involved by regional authorities in the provision of the civil law, and in three regions this function remained at the regional level.

Municipal entities do not have a voice in receiving functions from the upper levels of power. Federal law 136-FZ, dated May 27, 2014, empowers regions to redistribute responsibilities among local governments and other public authorities. Article 17 of 131-FZ stipulates that this decision is unilateral: municipal authorities cannot initiate or approve redistribution from the regional level. But municipal entities still have some opportunity to reshape the profile of their responsibilities: local bodies possess the right to sign mutual agreements on functional distribution. This right deepens discrepancies in the profiles of municipal commitments across the country.

The number of functions appointed to the local level in Russia is unevenly distributed across regions and municipal entities. It varies across the types of municipal entities and changes over time. Altogether the distribution of functions, with centers of decision-making located federally and regionally, can be used as an illustration that local self-governance in Russia is progressively being built into the federal "power vertical." The Congress of Local and Regional Authorities of the Council of Europe (2019) comments that these changes and their dynamics lead to "an erosion of the core competence of rural communities in violation of the subsidiarity principle and the degradation of quality of service they can deliver in the interest of their citizens" (p. 3–4). Asymmetric profile of local responsibilities is connected to the problem of poor financial sustainability at the local level in Russia.

## Financial Resources

Local self-governance in Russia is an independent actor in the national budget process, which has its own budget and sources of income. Initially, 154-FZ, dated 1995, and the relevant federal legislature (Federal Law № 126-FZ 1997) provided to newly established Russian municipal entities with a wide spectrum of possible income sources. However, this decision immediately led to a high diversification among municipal entities in standards of living, following the discrepancy in development of local economies. As pointed by (Molyarenko 2021), at this stage, depressive

**Changes in the Model of Municipal System in Russia, Table 2** The annual income of local entities in 2019 per type of municipal entity, in the number of municipal entities (share within a type of municipal entity). (Source: Ministry of Justice 2020)

| Type of municipal entities (according to the FZ-131, version of 2020) | Local budget income in 2019 | | | | | |
|---|---|---|---|---|---|---|
| | Less than 1 mln Rub | 1–10 mln Rub | 10–100 mln Rub | 100 mln–1 bln Rub | More than 1 bln Rub | Budget not approved |
| Rural settlement | 242 (1.4%) | 11,657 (66.9%) | 5,331 (30.6%) | 202 (1.2%) | 1 (0.006%) | 4 (0.02%) |
| Urban settlement | 2 (0.13%) | 77 (5.2%) | 1,006 (67.3%) | 398 (26.6%) | 11 (0.7%) | – |
| Municipal rayon | – | – | 44 (2.5%) | 1,194 (68.9%) | 495 (28.6%) | – |
| Urban district | – | – | 3 (0.5%) | 178 (29.2%) | 428 (70.3%) | – |
| Urban district with intracity division | – | – | – | – | 3 (100%) | – |
| Intracity rayon | – | – | – | 3 (15.8%) | 16 (84.2%) | |
| Intracity territory of a federal city | – | – | 171 (64%) | 82 (30.7%) | 6 (2.2%) | 8 (3%) |
| Total | 244 (1.1%) | 11,734 (54.5%) | 6,658 (30.4%) | 2,070 (9.6%) | 944 (4.3%) | 12 (0.06%) |

municipal economies did not have any means for economic development, while rich municipal entities were becoming economically, and thus politically, stronger. Table 2 presents the discrepancies in local economic development, depending on the type of municipal entity. The vicious cycle was broken in the 2000s through budget centralization reforms and the raise of redistributive financial efforts, which simultaneously turned municipal entities back into dependence on federal and regional financial policies.

Now, local budgets are filled through several sources: taxation, gratuitous receipts including inter-budgetary transfers from budgets of other levels, subventions, and nontax income. According to the Ministry of Finance (2020), in 2019, 65.9% of local incomes were shaped by redistribution from federal and regional budgets (through gratuitous receipts, transfers, and subventions). 28.4% of local budgets were fulfilled through taxation and 5.7% through nontax sources of income. Among federal and regional redistribution, 49.6% were provided through subventions, 27.4% through subsidies, 14.1% through donations, and 8.9% through other inter-budget transfers. Within the received taxes, 63.3% were provided by personal income tax, 12.3% by land tax, 11% by other taxes, 6.6% by taxes on comprehensive income, 3.6% by personal property tax, and 3.1% by excise taxes on petroleum products. In general, federal support to local budgets wanes: prior to 2003, local self-governance received up to 10% of the federal GDP, which diminished to 3.7% of GDP by 2016 (RANEPA 2016). In general, responsibilities of local self-governance do not correlate with its financial resources (Petukhov 2019). Local operations are frequently supported by a manual budget redistribution of federal and regional levels or inclusion of municipal level into federal projects, where municipal bodies participate only as an executor and have zero role in decision-making.

When national or regional functions are delegated for execution on the municipal level, the constitution (Article 132) obliges to provide municipal entities with additional material and financial compensation through budget redistribution. Local budgets may receive several types of gratuitous receipts and transfers: donations, subventions, subsidies, and other intra-budget

transfers. As summed up in Gilev and Shevtsova (2019), donations are designed to provide basic financial sustainability to local entities, if it falls lower a certain level. Subventions finance local execution of federal public functions, delegated downward to the local level. The amount of subsidies and other intra-budget transfers is decided by regional authorities and corresponds to the programs, implemented in a region, and to the economical profile of a municipal unit. The framework on redistributive obligations tempted to respond to the problem of "unfunded mandates." Such mandates frequently appeared when the federal or regional level announced some social commitments and delegated it, but did not provide sufficient funding to the lower levels, which become, de facto, responsible for provision of announced promises. With the increase of the rate of federal and regional transfers and subventions to local budgets, local financial and political independence is usually challenged.

Local budgets lose self-sufficiency and face deficits. Special-purpose federal subsidies are increasingly replacing local sources of funding, which strengthens misbalances in municipal budgets. As for 2019 (Ministry of Justice 2020), gratuitous receipts, including inter-budgetary transfers from budgets of other levels, comprised almost two-thirds of all local incomes, which indicates a very weak budget self-sufficiency of municipal entities. As for 2019, redistributive transfers from other level budgets in 15,900 municipal entities (73.5% of the sample) overdue their own municipal income through taxes by 5%. In 11,600 municipal entities (53.9% of the sample), this overdue comprised 20%, and in 4,900 municipal entities (22.8% of the sample), this overdue comprised 50%. The Budget Code allows to introduce additional means of control and audit over local accounts in municipal entities with high rates of deficit, when needed. So, low rates of local financial self-sufficiency pose a potential threat of a possible increase of the central government control.

In the current budget configuration, local governments do not have much incentives to contribute to their own economic development and expand their revenues. Budget centralization is the key obstacle. First, local taxes are transferred upward to the federal budget and then relocated back downward in shares decided by the federal and regional levels. Another line of centralization means that local self-governance is responsible for some upper-level functions (for instance, primary education) and receives funds to execute this function from regional authorities in the amount decided by a region, which might not correspond to real needs (Article 263, Federal Law №184-FZ 1999). The last line of centralization was implemented within the two-tier municipal entities. Upper-level entities can distribute budgets to the lower level but tend to avoid it to keep the available financial resources for themselves.

Nontax local income is provided by municipal property, lands, assets, and dealings involving the use of municipal housing stock. Municipal entities would have their own property, which is essential for the appropriate functioning of local communal facilities. Municipal entity property is received from the national and regional levels to provide local needs. Bodies of municipal entities can also purchase property for municipal disposal. The Land Code states that municipal entities may have land property and thus have income from its exploitation and land lease. The Code fixes rights to transfer land plots into municipal ownership free of charge from the federal and regional level and between municipal entities. But for the three cities of federal significance, Article 19 of the Land Code stipulates that, under certain legal conditions, municipal land plots can be transferred free of charge from municipal ownership to the federal city ownership. The Land Code does not mention any other ways how municipal entities can lose their land property. Possession of property is also distributed asymmetrically. For instance, Moscow municipalities do not have their own land.

Local self-governance in Russia also implies the right to take municipal credits and borrowings. Regional and local authorities face frequent necessity to borrow money from government and private sources, following weak economic basis and limited control over collected municipal taxes. Municipal entities may get credits from federal structures with lower interest rates than

those available on the private market. The accessibility of loans is better for municipal entities who closely cooperate in execution of federal public functions. Debt management creates another instrument of federal and regional control.

In the current financial profile, local entities face the fall of tax income with the overwhelming importance of central and regional transfers to municipal budgets. Such financial design allows qualifying it as a form of inbreeding of local self-governance into the vertical of power by the means of budget redistribution. Municipal entities work in the context of the general centralization in Russia, when regional and municipal levels of power progressively narrow down their autonomy and available instruments and lose incentives to be self-sufficient.

## Political Institutions and Public Involvement

The system of local self-governance implies that people can directly participate in decision-making and execution of local authority. Local self-governance in Russia combines instruments of direct democratic participation, institutions, and bodies to provide for local interests. Among the forms of direct participation of citizens, local self-governance implies the following instruments: local elections, local referenda, revocation vote to dismiss elected officials, "skhods" meetings, voting on changes of municipal boundaries, etc. Among the forms of citizens' involvement into institutionalized forms of local self-governance, 131-FZ provides the following possibilities: legal initiative, territorial public self-governance (territorialnoe obschestvennoe samoupravlenie, территориальное общественное самоуправление), public hearings, gatherings, conference of delegates, public polls, citizens' appeals to local authorities, orders of voters, election of rural starostas (headmen), municipal public chambers, and public discussions. Finally, following the ideology that local self-governance comprises the element of grassroots democracy, 131-FZ introduces the norm that all municipal entities in Russia must have representative bodies of power and their own executive authorities, i.e., a head of the municipal entity, a local administration, a head of the local administration, and a municipal control body. In Russian legal norms, a representative body stands for city council, composed of municipal deputies, and the head of the municipal entity and head of the local administration are official titles for the post of mayor and city-manager, respectively. Additional bodies can be organized.

The proliferation of organizational forms of power varies across the country and depends on types of municipal entity. According to the Ministry of Justice, as of March 2020, Russia had 20,792 established running representative bodies of municipal entities and 20,506 running executive heads of municipal entities. The existing discrepancy between the number of municipal entities and the number of representative bodies has technical reasons, i.e., processes of the dissolution or self-dissolution of representative bodies and running local reorganizations. Also, this statistics can be further detailed to reflect the double-headed structure of local executive power and the cases when local power executive and representative actors combine two local posts. Additionally, the smallest settlements with less than 100 residents have equivalents of local bodies of power – so-called "skhods" or a meeting of all residents, where residents decide local issues. According to the Ministry of Justice, as of March 1, 2020, only 1 urban settlement and 69 rural settlements had skhods instead of established representative bodies.

According to the Ministry of Justice (2020) and the Central Electoral Commission of the Russian Federation, the use of instruments of direct public involvement decreases along the time. Public hearings decreased in number from 95,600 events in 2016 to 85,000 in 2019. The number of citizens' meetings fell from 85,900 in 2016 to 59,400 in 2019; similarly public discussions fell from 53,900 in 2018 to 12,300 in 2019. Territorial public self-governance remains constant in number around 32,000 created organizations. The use of public polls significantly changed in number with the same decreasing trend: 5,100 events in 2016, 8,700 in 2018, and

1,100 in 2019. Local referenda are weakly applied in Russia: there were 160 events in 2012, 246 in 2014, 1555 in 2016, and 242 in 2020. Civil legal initiatives also have a low rate of application: 800 initiatives were discussed in 2018 and 200 in 2019. Apart from forming local bodies, municipal entities in Russia also apply other available instruments of local self-governance, but this activity is not very common. According to the Ministry of Justice, in 2019 local entities held 114 referenda, 111 of which referred to self-taxation of local residents to resolve some local issues.

In the political dimension, local reforms had four broad directions for innovations. First, in 1991, the law separated local administrations from the vertically integrated system of Soviets, where they played a role of local executive committees. In 1991, the law made executive heads formally independent within local self-governance, and this post had to be filled through popular elections. In 1995, 154-FZ introduced a possibility for a representative body to appoint a local executive head. In 2003, the law introduced a model of the double-headed executive branch: with an option of coexistence for a head of local administration and a head of municipal entity (equivalent to a city-manager and a mayor) within one local system. In the other direction of reform, local actors (a mayor, a city-manager, a head of city council) received a right to combine their posts in some configurations. The next stage of legal novels introduced diversification and proliferation of ways to appoint local political actors, instead of popular elections, even for deputies of local councils. Finally, the reform increased regional authority over local political systems. Table 3 gives an overview of the changes in the models of selection of authorities and embraces how various models of appointments progressively joined elective procedures and ways to appoint local officials diverse, depending on a type of a local entity. Among municipal entities, the procedures for selection executives vary for different types of entities and change along the time.

The variations in design of local executive branch imply coexistence and concurrence of the three alternatives: elections of heads (with heads-administrators elected by citizens), double-headed system (with a head – chair of representative body, selected from local deputies, and a separately appointed head of local administration = a city-manager), and appointments by the contest. The latter is more typical in more populous and economically sufficient municipal entities: i.e., municipal rayons, urban districts, urban districts with intracity division, inner-city rayons, and municipal districts. As of March 2020 (Ministry of Justice 2020) among 20,506 in 20,595 municipal entities, 8,455 local heads of municipal entities were selected from local representative bodies, 7,101 were appointed by the Contest Commissions, 4,972 were elected on direct municipal elections, and 67 heads were appointed by local skhods.

The official discourse contextualized the introduction of the double-headed model as the strive to increase efficiency of local policy implementation and to respond to the lack of trained staff to occupy local posts. According to the motivational part of these legal provisions, appointed city-managers were expected to better perform administrative processes, and the number of appointed posts increased along the time. However, studies reveal that the appointment of heads does not increase effectiveness of municipal administration; neither they provide better service provision (Kazantsev and Rumyantseva 2020). At the same time, the amendments in the local model of power introduced mechanisms that allowed to strengthen regional and federal political machines.

Political redesign of local self-governance increased regional authority over the local level by a sequence of federal laws since 2014. It progressively expanded regional authority in shaping municipal political systems and their elites. Now, regional authorities can decide when a head of municipal entity would be simultaneously a chair in a representative body or would combine the post of a head of municipal entity with the position of a head of local administration. Next, the head of a municipal entity might be appointed by the Contest Commission, formed jointly by a regional governor and a local representative body. In 2014, the share of seats in this Commission,

reserved for regional authorities, increased from 30% to 50% of seats. A governor has the right to present candidatures for the position of city-manager. With the rise of share of seats in the competition commission, selected by regional governors, to 50%, the heads of municipalities were, in fact, appointed at the governor's initiative and instruction. Also, regional authorities obtain the power in deciding a procedure to select local deputies of representative bodies in municipal entities of the upper level and to select heads of municipal entities. Regional decisions regarding procedures of selection are compulsory for introduction into municipal charters. Thus, for some types of municipal entities, regional authorities now possess the power to solely decide on the replacement of the election system by the appointment, including appointments of local deputies. According to the Council of Europe (2019), only four regions left "the opportunity to determine independently the structure and organization of local governments." This mechanism is criticized for the absence of clear criteria how regions should argue their decision on the design of the local political system and for the exclusion of residents from decision-making and selection of their local politicians.

Additional variability in municipal organizational exists in another technical dimension: the procedures of elections and appointments. Approaches to elections in representative bodies vary, as three models are simultaneously applied across the country: majority electoral system (single- and/or multimember electoral districts),

proportional electoral system, and the mixed model. According to the Ministry of Justice, as of March 2020, 19,469 of municipal entities deal with the majoritarian first-past-the-post elections (93.6% of all entities), 138 entities have proportional representation by party lists (0.7% of entities), and mixed system is applied in 509 entities (2.4% of entities). The model of appointment into representative bodies through a delegation procedure is applied in municipal entities of the upper level (which comprise 3.3% of the sample) and exists in two versions regarding the proportion of representation of the lower-level entities: with proportional delegation with an equal rate of representation and proportional delegation with an unequal rate of representation. According to the Ministry of Justice, in March 2020, delegation by equal representation was applied by 545 municipal entities (2.6% of entities) and with unequal representation – in 131 entities (0.6% of the sample).

Special peculiarities are stipulated for municipal entities of the upper level. To remind, the power to design local bodies in the upper-level entities is reserved to the regional authorities. Municipal charters just fix this regional decision. Newly introduced types of municipal entities of the upper level have appointment model for executive heads and delegation for deputies in the representative bodies. Depending on the model of selection, various local actors of the lower level get mandates in a representative body of the upper level. For instance, in the municipal rayons with the delegation model, a deputy seat is obligatorily provided to a head of lower-level municipal entity, granted that he was elected and not appointed through a contest. Meanwhile in the urban districts with inner-city division, only deputies of lower level are delegated to the urban district representative body.

In the administrative capitals of regions, only 10.5% of executive heads were elected. In general by 2020 only 24% of executive heads were directly elected (Ministry of Justice 2020). As a consequence, local-level elections are weakly competitive in terms of effective number of parties (Turovsky et al. 2020) and have low turnout as an indicator of weak political mobilization.

The double-headed executive model is not overwhelming. In the majority of cases, heads of local entities often combine the post of head of local administration and thus do not share executive power between two posts. Simultaneously, a high number of municipal executive heads also chairs in the local council, which can be treated as a serious challenge to the freedoms of local residents to select their own authorities. The Ministry of Justice monitors the trends, how municipal heads are selected. In 2019, among 21,245 selected heads of local entities, 5,136 were appointed by the competition and chaired local administration; 4,479 heads were appointed from local deputies and combined posts of Council Chair and head of local administration; 4,159 heads are appointed from deputies and chaired in local council; 3,317 were popularly elected and combine posts of Council Chair and head of local administration; 2,128 heads were popularly elected and headed local administrations; and 1,808 were appointed by the competition and also chaired local council and head of local administration. Finally, 125 heads were selected from the council deputies and head local administrations, and 25 heads were popularly elected and chaired local council. Thus, among local heads, in 8,001 cases the post of head of municipal entity is combined with another local post: a head of local administration or a chair in the local representative body.

The local reforms in Russia clarified the list of applicable designs of political institutions and helped to synchronize diverse models of municipal political organization across the country. In the beginning, by the law of 1995, the legal framework decentralized decision-making regarding models that would be applied by a municipal entity. Municipal entities decided on their organization of local bodies and declared it their local charters. Since 2003, the law stipulates exceptions for this freedom in municipal entities, by progressive changes in the federal law.

Significant variation of organizational procedures of the local bodies of power is the consequence of this diversity of the possible options. Observations reveal that appointments and delegation prevail in local entities with authority of

regional decisions over the local political model (upper-level municipal entities, administrative capitals of regions, peculiar territories). For instance, municipal entities of the upper level (municipal rayons and urban districts with inner-city division) have a right to appoint representative bodies by delegation, while in such two-tier municipal entities, the lower level may lack an executive head. Double-headed model of the executive branch of power is evaluated by experts as another way to reduce local autonomy. The capacity of local residents to select local political design and political actors narrows down along the time.

## Municipal Servants and Municipal Deputies

Municipal deputies, local heads, and municipal servants comprise a large professional community in Russia. The general number of municipal servants and workers involved in municipal self-governance accounts around 500,000 persons. According to the Ministry of Justice, altogether the corpus of deputies of the local representative bodies encounters 210,400 deputies. 73.3% of the total corpus of municipal deputies are deputies in rural settlements (150,800 deputies). Of this number 205,800 running deputies in 20,116 representative bodies were selected through direct elections. In the executive branch of power, the system numbers 20,506 municipal heads. According to the Ministry of Justice (2020), among 205,800 running deputies, 194,600 deputies (94.5% of the elected local deputies) were elected by a majoritarian system, and 11,300 deputies (5.5%) were elected by a proportional system from the political parties. 15,600 deputies were appointed through delegation from a municipal entity of the lower level to a council of the upper level.

The majority of local deputies execute this job on a voluntary basis, i.e., not as a paid job. The federal law limits the rate of professional full-time deputies by 10% of the quantity of mandates. According to the Ministry of Justice, in 2020 7,100 elected deputies (3.4% of elected deputies) and 930 delegated deputies (5.9% of delegated deputies) executed their job on a constant basis. Executive branch of power is run mostly by technocrats: among 20,595 ruling heads of administration, 17,100 (83% of the sample) have it as a full-time job. All heads who combine the post with the posts of a Council Chair and a head of municipal entity are obliged to hold the post on full paid contract.

The multiplicity of municipal servants and deputies has its pros and cons. On one hand, proliferation of local authorities provides space for citizens' initiative and participation. On the other hand, the high number of citizens involved in local self-governance raises issues of low professional expertise and weak quality of decision-making by this numerous, frequently untrained, professional strata.

Municipal servants comprise another big community, which is not equal to the public servants and has a separate status. Altogether 296,500 municipal servants provide the working capacity on a full- or part-time contract basis. Local administrations, with territorial and sectoral bodies, have up to 280,600 municipal servants, and 7,300 employees work in representative bodies, with 4,800 in other bodies and 3,900 in control and accounting bodies, as reported by the Ministry of Justice (2020).

## Control by Federal and Regional Levels of Power

Despite declared wide autonomy of local self-governance in Russia, local self-determination is limited to some extent: 131-FZ states that the sphere of application of local self-governance is defined by the Constitution and 131-FZ but also, when relevant, by regional laws and federal laws on neighbor matters. Federal government introduced several "particular" territories, which are regulated not only by 131-FZ. Chap. 11 of FZ-131 embraces ten "particular" territories in Russia where local self-governance is implemented in concordance with separate federal laws. These territories include the following:

1. Federal cities (3 cities of federal significance which have status of a region and comprise altogether 267 municipal units)
2. Closed cities (38 officially acknowledged as "ZATOs" – an acronym for Russian "closed administrative-territorial formation," supervised by the Ministry of Defense, the State Atomic Energy Corporation Rosatom and the Russian Space Corporation)
3. Scientific cities (13 "naukograds")
4. Frontier areas (424 municipal units located in the border zones across the country)
5. Regions of the Far North and equivalent areas with limited terms of delivery of products (a numerous list of municipal units in various regions (Decree of the Government 402, dated 2000))
6. Territories of the innovation center Skolkovo (which is formally located on the territory of the Kuntsevo municipal entity of Moscow, but does not represent any municipal entity itself so far)
7. Territories of advanced socioeconomic development and mono-cities (around 170 municipal entities for 111 territories which include territories created in 8 ZATOs)
8. Territories of innovative scientific-technological centers (four existing centers are located in three different regions of federation)
9. Territories of the free port Vladivostok (38 municipal entities within 5 regions)
10. Municipal units located in the Arctic zone (a numerous list of municipal units in nine Arctic regions).

The cluster of municipal entities that is regulated not only by 131-FZ expands along the time. To compare, in 154-FZ, dated 1995, the regulation by additional federal laws regarded only frontier areas, ZATOs, and federal cities. Additionally to the list of "particular" territories, embraced by the Chap. 11 of 131-FZ, federal laws establish separate rules for local self-governance in other kinds of settlements: particular economic zones (represented by 360 municipal units), historical settlements (represented by 147 municipal units), and territories of traditional natural resources use (represented by 360 municipal units). Thus, altogether Chap. 11 of 131-FZ and several additional federal laws, de facto, cover around 10% of municipal entities all over Russia, where local self-governance is designed in accordance with federal and regional decisions. A large share of "particular" territories represent the most populous (i.e., Moscow, Saint-Petersburg) or high-income local economies.

Another point of control on local self-governance is concentrated on the regional level. Along with the construction in Russia of the "power vertical" in the 2000s and the acquisition of regional autonomy into the federal sphere of responsibility, some rights of local self-governance were progressively relocated into the hands of the regional authorities. As mentioned above, within fiscal centralization, regions decide on the amount of financial transfers they relocate to local self-governance. Regions decide on the amount of responsibilities, delegated and subdelegated to municipal level, and which municipal functions would be acquired by a region. Regions shape the selection committee and suggest candidates for the post of the local head.

For certain types of municipal entities (municipal rayons, urban districts, intracity districts, particular territories, and important urban settlements which respond to certain statistical or administrative criteria), regional law may decide on a model of appointment of the local head: as illustrated in Gilev and Shevtsova (2019), governors actively applied their rights. In 2009–2011, regional authorities replaced mayoral elections with double-headed models in the regional administrative capital cities, thus gaining control over local heads. In 2010, governors received instruments of financial centralization. In 2014, with provision for regions of a right to select the local model of power and merge and enlarge municipal entities, regions replaced elections in the municipal entities of the upper level. Means of budget redistribution allows political machines of the regional and federal levels to inbreed the municipal layer into the vertical of power. Thus, studies provide some illustrations that municipal political loyalty to a region predicts more favorable budget

redistribution to a municipal entity (Gilev and Shevtsova 2019; Gasparyan 2021).

Additional motivation for regions to control local self-governance roots in the procedure of municipal filter, introduced in 2012 with the return of direct elections of governors. Since then, candidates to the post of regional governor should collect signatures from municipal deputies in a region to be nominated as a candidate. Municipal deputies should represent over 75% of municipal entities of the upper level in a region. The threshold of this filter currently varies from 5% to 10% of the number of municipal deputies in a region and might be adjusted upon regional discretion within this limit. Thus, regional incumbents have their own interest in keeping ties with local self-governance in a region.

The ruling party "United Russia" is another instrument of indirect accountability of local self-governance to the federal and regional levels. Among directly elected deputies by the majoritarian system, 75.8% were elected as "United Russia" candidates (147,600 deputies), with the second largest group elected as independent self-nominated deputies 15.4% (30,000 deputies). Among deputies elected by proportional representation and party lists, United Russia deputies hold 68.3% of local seats (7,800 deputies) with the next largest group elected from the Communist Party of the Russian Federation (17.2% or 1,900 deputies).

Apart of progressive redistribution of powers from local level, key local issues remain protected under local responsibility. They include local charter approval and amending, local property management, local budget approval and implementation, public order provision, approval of the structure of local bodies of power, etc. Regions do not get involved in these issues.

In the closed administrative territorial entities (ZATOs), the rights of the local population to decide on the candidature of its head are limited by another rule: a head of ZATO is appointed by the representative body from the list of candidates suggested by the contest commission, whereas the commission itself is appointed for one-third by the representative body of ZATO, for other one-third by the regional governor, and for the last one-third by the head of the federal corporation or the federal structure responsible for this ZATO (Ministry of Defense, Russian Nuclear Corporation or Russian Space Corporation).

Cities of the federal significance (primarily Moscow and Saint-Petersburg) practice a very limited variation of the local self-governance. Moscow City charter attributes exclusive powers to Moscow in determination of the system of local self-governance, regulation of the budget, property management, planning, and others that are typically distributed to the municipal level of authority (Article 13 of the Charter of Moscow). Key functions of lower levels and resources are concentrated in the hands of prefectures, which represent the lower level of the regional authority. Meanwhile councils of municipal deputies (Moscow municipal representative body) and local administration are responsible for a very narrow list of issues, such as local holidays. The latter however cannot contradict the federal laws adopted in the matter of joint jurisdiction with the federation. Prior to the adoption of a federal law on a matter of joint jurisdiction, the Moscow City has the right to adopt a legal act on the issue, which shall be then brought into line with the relevant federal law once it is adopted.

## Conclusion: Institutional Perspectives

Russian local self-governance changes, in accordance with the development of the Russian political regime (Gelman and Lankina 2008; Reuter et al. 2016). In the strive toward centralization within the "power vertical," areas of freedom of local self-governance are progressively diminished. The federal and regional authority over local self-governance expands, making central and regional powers more influential on local political regimes, political elites, and their area of responsibility. Despite numerous reforms, municipal system across the country remains highly asymmetric in various dimensions: by territory, population, economic sustainability, representativeness of citizens in local councils, and other indicators. Formally, institutional placement of local self-governance in Russia remains

unclear. Following the latest amendments into the constitution in 2020, municipal system was included into "the unified system of public power." Assuming that "the public power" might embrace all three tiers of public administration, autonomy of local self-governance in Russia is under severe risk. However, official clarification of this notion is expected in the nearest future.

# Changing Nature of Global Armed Conflict

Ozcan Ozkan
Turkish National Police, Ankara, Turkey

## Introduction

The nature of global armed conflict has been undergone tremendous change in the past three decades. Especially after the demise of the Soviet Union, the world entered into a new era. In this new era where the United States has remained only superpower in the globe, the unipolar trend was only challenged by emerging new threats such as global terrorism (Ferguson and Mansbach 2004). The transition period was not a peaceful one since the newly established states in Eastern Europe and some failed states in Africa and the Middle East have seriously challenged security of the developed countries both in Europe and the Americas. On the other hand, some states in Africa and elsewhere had long lacked the colonial backing as a result of the decolonization process starting in the 1960s. After the end of the Cold War, some of these states were further left without support from either bloc. In this situation, many states have failed because of lacking political, economic, and authoritative capacity to meet their people's needs, triggering intrastate wars rather than previous interstate wars.

The most important threat for both domestic and international stability came from asymmetric warfare including terrorism. Among them, the 9/11 attacks marked a new period in which transnational terrorism changed the nature of armed conflict greatly thanks to facilitating factors of globalization (Hoffman 2006). In addition, advanced technology made conventional wars obsolete, triggering a revolution in military affairs.

## The Changing Nature of War

The process of globalization has been great impacts on armed conflict. Economic interdependence and spread of democracy in some parts of the world led states to form security communities where war between them is becoming less and less likely (Ferguson and Mansbach 2004). Kantian approach that democracies will not fight with each other showed the instrumentality of democratic peace theory for the last decade. However, this does not mean that democratic countries will not go to war with nondemocratic states to spread democratic zone of peace (Viotti and Kauppi 2010). The American decision to wage war against Iraq to topple Saddam Hussein in 2003 was partly due to this argument that a democratic Iraq without a dictator would be an example for others in the region toward a peaceful democratic region.

On the other hand, in some parts of the world wars are still present. As famous nineteenth-century strategist Clausewitz said, war is a continuation of political activity by other means. And it is unlikely that it will disappear. The characteristics of war might change, but essential nature of war could not. Although the end of the Cold War and dissolution of the Soviet Union eliminated great wars between great powers, the political authority vacuum created by the demise of the Soviet Union and violent and brutal transition period of nondemocratic states toward democracy caused states disintegrate into civil wars and insurgency. In addition, temporary hegemonic control of the United States without a rival in the world together with Westernization attempts faced with cultural and political resistance that has showed itself brutally in many parts of the world.

In a globalized world where communication and transformation technologies expanded worldwide thanks to recent advanced tools like satellites, telephones, and Internet, the notion of battlefield changed to such extent that cyberspace

has become battlespace itself. While new arms technology allows states to launch long-range missiles in a far distance to the actual battlefield, this technology may also be used by terrorists to disrupt and devastate government infrastructures as well as to intimidate their enemies. Even if the great wars are not likely in the near future, a possible conflict on weapons of mass destruction (WMDs) may trigger an unprecedented warfare by using these weapons. For instance, the possibility of a nuclear confrontation is increasing as the practices of North Korea and Iran as well as terrorists attempting to acquire nuclear weapons are challenging the international peace. Mass media is also playing an important role in showing the brutality of war globally making it more understandable for the global audience and viewers (Allison 2010).

The nature of war has been shifting in recent decades under the impact of globalization, eroding the autonomy of the state. International system, international law, norms, and rules are greatly concerned with how to prevent war (Singer 2004). Formerly, after every Great War, a new international system was formed to better deal with the possible causes and consequences of wars. After the Thirty Years' Wars, the Peace of Westphalia in 1648 first set up a system among states to prevent another catastrophic war (Viotti and Kauppi 2010). After the Napoleonic Wars, the Concert of Europe was set up in 1815 and played an important role in sustaining relative peace among states with realist balance of power and diplomatic tools. When the World War I broke out, the previous system collapsed and the postwar arrangements under the umbrella of League of Nations tried to reach a consensus in order to eliminate future wars by the notion of collective security. However, this system backed by liberal thinking did not work well and consequently could not prevent the outbreak of another world war. The United Nations (UN) came into being with a distinctive authority to sustain international peace with its Security Council after the World War II. The UN system and Bretton Woods arrangements also gave priority to economic and social issues as low politics while maintaining military and security issues as high politics since both economic and social affairs are all important factors to leading to a war (Singer 2004).

Realist and neorealist approaches giving priority to states and international system under anarchy dominated the postwar environment. Their supporters criticized the naïve propositions of liberalism which encouraged states cooperate rather than compete. Liberal and idealists proved to be inadequate when cooperation and interdependence did not prevent states to wage war against each other. With the beginning of the Cold War, the USA and the Soviets started an arms race. In addition, security and military blocs between the two powers led to a bipolar international system (Waltz 1988). Neorealist thinkers like Waltz argued that a bipolar world is one of the most stable kinds of international system since such system is easy to manage, and miscalculation is minimal (Waltz 1988). On the other hand, multipolar system is complex and more prone to lead to war through miscalculation and misperception (Viotti and Kauppi 2010). However, as far as nuclear proliferation is concerned, many including Waltz argued that more nuclear-capable states may be better than fewer and multipolarity is better than bipolarity since more uncertainty causes caution, and caution means following tried and true policies of the past that avoid deviations (Allison 2010).

It is argued that in the anarchy of international system, improving the means of defense and deterrence relative to the means of offense increases the chances of peace. Weapons and strategies that make defense and deterrence easier, and offensive strikes harder to mount, are believed to decrease the likelihood of war (Viotti and Kauppi 2010). This argument is shared by most of the nuclear-capable states or states seeking nuclear technology. Since the 1962 Cuban crisis and later the period of détente came with a time when striking was believed to lead to catastrophic consequences, nuclear arms race between great powers did not end up with a hot war (Allison 2010). Rather, it led to developing smart weapons especially on the side of the United States which was known as Strategic Defense Initiative (SDI) or popularly as Star Wars.

This revolution in military affairs proved to be instrumental in the 1991 and 2003 Iraq Wars

which gave the US-led coalition effortless victory thanks to possessing these advanced weapons and satellite systems. In this environment, unconventional or asymmetric responses to great powers of superior capacity started to take place as seen in Soviet withdrawal of Afghanistan in the 1980s, Arab-Israel conflict from the beginning until today, Yugoslavia in the 1990s, and today in Afghanistan and Iraq where military and technological superiority are being challenged by insurgents and local militias with limited weapons and strategies but a novel and unstoppable weapon among others: suicide bombing. The 9/11 attacks as suicide bombing has marked the most complicated asymmetric assault to a superpower in history. This can be seen as the changing nature of armed conflict where high-tech wars between sophisticated and organized alliances were replaced by conflict of almost completely opposite character – low tech, local at planning but globally trenchant and deeply disorganized (Ferguson and Mansbach 2004).

## New Armed Conflict

Today, globalization not only causes a wide range of economic, cultural, social, and political change, it also affects the character of war. Gender started to play an important role in suicide bombings. Child soldiers are increasingly being used in African intrastate armed conflicts, in Israeli-Palestinian conflict, and in Afghanistan by Taliban forces. In some places, advanced states are willingly transferring some of its military functions to private authorities, creating a kind of "outsourcing of war" while these functions are being seized from the state by other actors like warlords in another part of the world. Indeed, more and more states are contracting out some military services to Privatized Military Firms (PMFs) which sell a great deal of war-related services to states in the logistical and security roles rather than direct combat as seen in the 2003 US-led invasion of Iraq.

The concept of total war of twentieth century which involved the mobilization of whole population, economy, and military resources of the state seems to fade away, but the total loss of both intrastate wars, civil wars, and terrorist attacks still remain very high as seen in Rwanda, Bosnia, Liberia, Somalia, and other places as well as in the 9/11 attacks.

War has long been seen as armed conflict between opposing states at least since the Westphalian state order, fought by uniformed, organized bodies of soldiers. In most cases, wars were regulated by different acts, norms, and rules. This is not the case today when intrastate armed conflicts have dominated the global agenda for the last 25 years (Singer 2004). The driving force behind these new wars is globalization process which has increasingly eroded the economic, political, and military autonomy of the state in some part of the world where disintegration of states and struggle for control of the state by conflicting groups have mostly ended up with intrastate violent armed struggle (Ferguson and Mansbach 2004). As those states lose control, privatized and paramilitary groups gain access to weapons of the state or usually via organized groups dealing with arms trade (Singer 2004).

This new armed conflict in which religion, identity, and culture play an important role is also reflected in Huntington's "clash of civilization" (Huntington 1993). As opposed to his former student Fukayama who prematurely called early postcold war era as "the end of history," Huntington never expected an emergence of a global civilization after the end of the Cold War. Even if there is increased interconnectedness between societies, the world would fragment into civilizational blocs and cultural and ethnic enclaves. According to Huntington, world politics is entering a new phase in which the fundamental source of conflict will not be primarily ideological or economic, but cultural (Ferguson and Mansbach 2004). Although he concedes that nation-states will remain the most powerful actor, he contends that the principal conflicts will occur between nations and groups of different civilizations. Particularly, the clash between the Western and Islamic states is likely to become more rather than less intense. Part of the reason is that the West is now at the peak of power in relations to other civilizations and there has been a hostile reaction to this dominance by other civilizations (Huntington 1993).

Other important reasons for the new armed struggle are poverty, overpopulation, crime, disease, and environmental degradation. In particular, the environmental degradation is increasingly becoming a major cause of conflict in certain areas of the world. One of the most prominent analysts on relations between environment and global conflict, Thomas Homer-Dixon, contends that wars and civil violence will often arise from depletion of resources such as water, cropland, forest, and fish (Homer-Dixon 1999).

Finally, long ignored issue of terrorism gained priority in global arena. Neoliberal institutionalists and realists mainly focused on nuclear weapons for a long time, and terrorism was regarded as a secondary issue that required neither attention nor analytic rigor. This was changed after 9/11. Terrorism experts such as Bruce Hoffman had long been warning of the emergence of new and more lethal forms of terrorism including emergence of religious terrorist organizations even before 9/11. His main argument was that religious motivations combined with enhanced terrorist capabilities with new technological tools could indicate an even long, bloodier, and more destructive era of violence in the history. The 9/11 attacks proved Hoffman's assessment of changing nature of terrorism to be true (Hoffman 2006).

## Conclusion

The process of globalization has greatly changed the face of armed conflict. Some elements, though, still remain the same. While in some places armed struggle is continuing for promoting political activity, in other places armed conflict is occurring due to economic and environment scarcity concerns (Homer-Dixon 1999). The asymmetric threat of terrorism is increasingly affecting state behavior, while the solutions to terrorism and armed conflict still remain inadequate. With the advanced technological capacities becoming more and more accessible to anyone including terrorists, the nature of threat has also gone global transcending boundaries. Terrorists' wish to acquire weapons of mass destruction underscores the gravity of the threat. As the character of conflict goes beyond the traditional borders of states so must the response. Multilateral arrangements by the United Nations and other supranational bodies to date have not addressed the issue adequately, but there is hope that new kinds of multilateral, regional, and international cooperation in all levels of political, economic, and cultural aspects (Viotti and Kauppi 2010) as well as law enforcement and military cooperation between individual states can emerge to reduce the risk and casualty in the face of the changing nature of armed conflict globally (Singer 2004).

## Synonyms

Administrative networks; Implementation; Multilevel governance; The European Union

## Definition

Indirect administration: a constituting administrative principle of the European Union (EU) in which member states are obliged to comply with legislation and policies adopted by supranational institutions, but where implementation is left to member states' governments and their domestic administrations. Such a dual administrative system or "administrative sovereignty" enjoyed by the national level was the intended form in the EU (Hofmann and Türk 2006).

## Introduction

The EU does not have a clearly defined and coherent administrative policy (Olsen 2007). In the implementation of EU legislation, the European Commission has relied heavily on domestic, national administrations. Such an arrangement, where the administration of common policies takes place indirectly through lower-level governments is probably the form that allows the most varied administration practices across territories.

As a response to these challenges, administrative capacities at the EU level have expanded significantly since the 1990s (Bauer and Trondal 2015; Egeberg 2006; Kassim et al. 2013). The Commission and the member states have adopted various organizational models for connecting executive policy-making across levels. Core components in this development are European-level networks and agencies, established to facilitate harmonization of policies and legislation across Europe.

Agencies and networks may vary according to their specific functions, but in general terms, they are established to gather knowledge, promote coordination, and uniform administration of EU law. Agencies tend to be more institutionalized in terms of internal organization and capacity. They are more often set up according to specific EU legislation with a formal mandate and legal status, and they have secretariats staffed with fulltime experts. European regulatory networks (ERNs) tend to be less formal, operating through collegial, nonhierarchical and open modes of coordination. Usually, networks engage participants on a part-time basis, while being primarily attached to their "home" organizations.

The dissemination of ERNs and agencies at the European scene is characterized as "a new regulatory architecture" (Levi-Faur 2011, p. 810), with transformative implications for the EU's dual administrative system. They have become arenas for new ways of administration and implementation, in which representatives from regulatory agencies at the national level connect directly with Commission representatives in their joint efforts to facilitate implementation of EU legislation. These patterns of direct governance tend to create "double-hatted administration," in the sense that national agencies become parts of two hierarchies. They continue to serve their national governments and ministries on the one hand, while simultaneously coordinating directly with the EU executive center on the other.

The "glue" in these new, direct forms of governance is found to be compatible specialization and functions across levels of governance. On this basis, existing scholarship now refer to a multilevel implementation structure based on sectoral specialization and direct coordination (Egeberg and Trondal 2016; Treib 2014). However, as policy-aims and legislation become more ambitious and complex, the European Commission seems to take on a more programmatic role in both horizontal and vertical coordination. Thus, recent research has begun to focus on the role of procedures as supplementary mechanisms that may expand coordination across organizational divides.

## The EU Water Framework Directive: A Framework for Crosscutting Water Management

An example of a complex piece of legislation is the Water Framework Directive (WFD), which is currently being executed across the European Union with the aim of bringing all water bodies up to "good ecological and chemical status" by 2027 (Directive 60/2000/EC). The WFD was adopted in October 2000, at a time when the EU and its member states were marked by a patchy regulatory framework with more than

20 directives regulating water. There was a growing consensus that water policy was fragmented in terms of objectives, means and management, and in need of a more coherent framework (Indset 2017). This prepared the ground for a directive that stands out as a pioneering piece of EU-legislation, both in terms of policy aims and orchestration of administrative measures.

The main objective of the WFD is to safeguard the aquatic ecosystem (WFD art. 1), by acquiring "good environmental status" of European waters. This may be seen as an intrasector coordination effort (environment), i.e., processes whereby actors, problems, solutions, and modes of thinking are linked closer together within a policy area. Simultaneously, the WFD intervenes in the member states' political administrative systems by inserting the principle of river basin management: administrative structures and borders must follow the natural drainage area of the water itself (river basins). All authorities with tasks affecting water are obliged to coordinate their actions "for the whole of the river basin district" (RBD) (WFD 2000: preamble (35), Art.3 §4). This is coordination per territory, to be achieved in a European context characterized by single-purpose, fragmented administrative systems (Lægreid and Verhoest 2010). Thus, the WFD combines intrasector coordination with coordination across territorial divides. Further, the river basin coordination requirements of the WFD direct attention beyond the central state level and towards the regional river basins, refocusing vertical coordination, which challenges the principle of indirect implementation. Taken together, the quest for coordination that follows from the WFD aims at concerted action across both sectors, river basins and levels of governance.

When the WFD was adopted in 2000, a range of operative provisions were unsettled. For instance, given the objective of "good ecological and chemical status," there was no coherent, intercalibrated system for measuring environmental status of European waters, i.e., water types, priority substances, hydromorphological alterations, chemical inter faces, biological diversity indexes from alga to fish stocks, net impact, etc. Thus, the WFD was adopted as an unfinished directive.

Due to the encompassing coordination challenges of the WFD and its unsettled issues, a European-level network labelled the Common Implementation Strategy (CIS) was established to facilitate its achievements. This chapter directs attention to the role of coordination mechanisms in the CIS, a network facing encompassing and partly diverging coordination challenges in policy implementation.

## Coordination and Mechanisms Fostering Connectedness

Actors and organization structures can be tightly or loosely connected (Orton and Weick 1990). They may connect horizontally across organizational divides, as well as vertically across levels of governance (Gulick 1937).

As pointed out above, direct relationships across levels have been identified as a key pattern of coordination in the emergent forms of direct governance in the EU. These direct relations are based on shared functions and compatible specialization as coupling mechanisms (Gornitzka and Sverdrup 2015). Such "like-mindedness" is seen to foster a common orientation, problem-solving and role conceptions as territories diverge.

However, in order to facilitate more encompassing and crosscutting coordination challenges, one has to take into account both the specific interplay of resources within the network, as well as how the network connects with the external environment.

Interinstitutional connectedness may also be enhanced by means of procedure-based mechanisms, i.e., instruments that pertain to *how* work is performed (March and Simon 1958). Changing or harmonizing the work process may direct administrative behavior in certain ways, foster learning and alter coordination (Borrás and Jacobsson 2004; Radaelli and Meuwese 2010). Ranging from informal to binding, procedure-based mechanisms may comprise peer-reviews, best practices, guidelines, common methods, quantitative measures and parameters, fixed

routines, standardized work processes, as well as enforcement mechanisms such as monitoring, reporting, and rule-making (Bouckaert et al. 2010).

In addition to mapping the deployment of coupling mechanisms, there are various models for how administration can be connected. One is traditional, hierarchical administration, where coordination takes place indirectly through the Government apparatus. Another is direct coordination between the Commission and parts of member states' administrations. Between these ideal-types of direct and indirect implementation there are in-between, hybrid ways of implementing EU policies.

Executive centers do not always govern targets directly. Under conditions of limited capacity, the Commission may bring in third-parties, or seek to govern through proxies in order to increase control, efficiency, or legitimacy. For instance, agency-formation at the European level has extended the Commission's indirect capacity to operate as an executive center (Egeberg 2006). The Commission also delegates to private standard setting bodies to flesh out the technical conditions of minimum requirements in the field of harmonization and mutual recognition of technical product standards (Abbott et al. 2015). These are patterns of hybrid indirect governance, as national governments do not necessarily operate as intermediaries in these indirect implementation arrangements. Instead, such arrangements serve partly as side-structures, with the Commission as the executive center. Thus, both direct relations and procedure-based mechanisms may enhance connections between certain parts of a system. If we see integration as increased connectedness between various parts of a system, a sign of increase in the level of integration in Europe is the degree to which various coordination mechanisms is institutionalized in a network.

## How the European Commission and the CIS Accommodates for Coordination

The CIS organizes work by purpose with organizing work by procedure. Building on the "robust pattern of intrasector coordination" and relations with like-minded counterparts at both the ministry and agency levels in the member states, the European Commission is able to gain legitimacy for procedures and means that in practice extend the scope of coordination and affect authorities and policy execution that is not directly represented in the CIS.

In the CIS, work has been systematically organized according to different specializations, which has facilitated coordinating relationships based on shared functions, expert-orientation and like-mindedness. Participants from the environmental policy field constitute the majority in the CIS, but they are assisted and sometimes challenged by authorities from other policy areas. This is revealed, by organizing working groups on, for instance, chemical aspects, groundwater, and agriculture.

A second finding is that the CIS structures its work rather thoroughly by means of procedural specialization. Many of its working groups have been set up according to procedural aims, such as working out joint reporting schemes, data and information sharing systems, and river basin district planning templates. These procedures are deployed at river basin district level, and/or by affected sectoral authorities. As a result, the outcome of the CIS is not only direct patterns of coordination between European level executives (European Commission, European Environment Agency, and Joint Research Centre) and national level agencies of compatible specialization. The CIS has been able to institutionalize and control the production of common procedures, methods, and work-processes with a cross-sectoral and multilevel reach. The systematic organization of work by procedure has been crucial in order to accommodate for horizontal and vertical coordination. Although actors from these parts of the administration not necessarily participate directly in the CIS, studies show that they comply with a certain degree to these work processes and procedures.

One example is the key WFD-task of carrying out an intercalibration exercise for all river basins of Europe. This exercise converges water types, metrics, and indicators previously split by countries and sectoral authorities into a coherent

classification system. This has never been done in EU law before. The process is based on scientific methods addressing the cross-functionality of threshold-values and interfaces. As CIS-members have been able to agree on intercalibration systems, these have been subsequently adopted through the Comitology procedure and added as appendixes to the WFD. The point is, this way of governing European waters by working out common methods, work processes, and measurement-systems provides for a governance scope beyond the direct relations in the network. The CIS has managed to institutionalize traditional, hierarchical measures such as rule making, reporting, monitoring, and standard operating planning procedures. Through these procedures, the network extends the scope of coordination across sectors and governance levels. When in addition, the execution of these systems in the river basin districts have to be reported back to the Commission and the CIS, a vertical, indirect governance tool is established between the Commission and the river basin districts.

As noted, as key to this crosscutting coordination are the procedure-based mechanisms. Moreover, the CIS is organized in a hierarchical manner. CIS-participation is not restricted to national level agencies organized at an arm's length from its parent ministry. On the contrary, ministry representatives participate in a superior "steering group" together with representatives of the Commission. The fact the CIS include ministry participation suggest that it does not aim to operate insulated from ongoing political processes. This is confirmed by informants (Indset 2017). The Commission seeks to build connections and common understanding with their counterparts in Environmental ministries, but in an informal way so that meetings "don't turn into the Council." The aim is to influence cross-sectoral policy coordination.

Further, key participants in the CIS are representatives from national Environment Agencies. This participation is organized as a mid-layer in a strategic coordination group, which is in charge of coordination within the CIS. These participants are the ones most involved in the CIS and commonly work full time with coordinating WFD-implementation in their home countries. Due to this position, they not only coordinate issues within the CIS, but also serve as proxies, or an intermediate level between the Commission and the river basin district level, carrying messages back and forth or up and down in the multilevel system.

Thus, the CIS mixes governance based on direct coordination with the rather systematic production of rules, metrics, methods, and work procedures to be executed by national administrations. To facilitate the execution of these procedures, they need proxies in national administrations. In this way, the CIS supplements and challenges the traditional mode of indirect administration, by redirecting indirect coordination along a new pattern. It builds on the robust pattern of intrasector coordination and supplements it with coordination by procedure-mechanisms. Through this, the network extends its scope of coordination. It builds on the robust pattern of intrasector coordination as a stepping-stone, in order to legitimize more ambitious coordination efforts in crosscutting coordination.

## Conclusion

Existing scholarship sees ERNs as a significant contribution to the emerging European administrative system, due to assets such as capacity building, empowerment of national agencies vis-à-vis their parent ministries, and the emergence of direct forms of intrasector coordination between these agencies and EU-level institutions. Although they vary in form and character, they are primarily seen to produce transformative effects along a multilevel implementation structure based on sectoral specialization. In this article, it is exposed how the CIS, an ERN established to facilitate the achievements of the WFD, has been capable of institutionalizing coordination efforts across sectoral divides and levels of governance.

These structures of coordination have advanced coordination towards indirect patterns, institutionalized in a network. This suggests that

the CIS can be regarded as a side-structure of implementation, complementing and challenging the member states' own policy coordination in the field of water policy. This complexity has made the Commission an increasingly influential hub of both vertical and horizontal coordination. As such, the Commission's coordination efforts close in on the political center and stretches down to the subnational, regional river basin district level of governance. In sum, these observations indicate a novel role for ERNs in the role of multilevel coordination.

# Chaos Theory of Organizations

Gardenia Harris
Illinois State University, Normal, IL, USA

## Synonyms

Complexity theory

## Definition

Chaos theory seeks to explain the behavior of systems that don't unfold in a linearly predictable

manner (Murphy 1996). Chaos theorists conceptualize organizations and the environments in which they exist as dynamic, nonlinear systems with complex structures (Levy 1994). Chaos theory does not define chaos and disequilibrium as abnormal (Swank 2001) recognizes the organizations and the environments in which they exist are subject to constant change. Upon initial observation, chaotic systems appear to be random, disorganized, and unstructured; however, in actuality, all chaotic systems are characterized by order, structure, and patterns (Morgan 1997; Murphy 1996). Chaotic behavior and random behavior differ in important ways. Random behavior exists when an entity, given choices, is likely to perform any one choice with equal probability. For example, a molecule is just as likely to move right as left. In contrast, chaotic behavior is more structured, stable, and deterministic, and although it may be predictable in the short term, it is always unpredictable in the long term (Marion 1999).

## Introduction

Chaos theory developed in the fields of mathematics and natural sciences, such as meteorology, (Wallace and Fertig 2007) during the 1970s (Murphy 1996). Meteorologist Edward Lorenz is widely credited with popularizing chaos theory (Cutright 2001). Lorenz discovered that despite daily, seasonal, and yearly variability, weather patterns are consistent and repeat themselves over time, in terms of temperature, precipitation, wind patterns, etc. (Morgan 1997).

Social scientists began using chaos theory as a metaphor to explain social phenomena (Dever 2001) in the 1980s (Murphy 1996), when more complex scientific models of explaining the world started to displace traditional scientific models. Not surprisingly, the use of complex scientific models impacted the types of theories used to describe organizations (Barnetson 2001). Organizational theorists who utilize chaos theory to understand organizational functioning accept that its mathematically – and scientifically – derived principles can be translated and applied to the more multifaceted world of people and organizations (Wallace and Fertig 2007).

## Nature of Causality

Traditional and chaotic systems differ with respect to the type of causality that influences the dynamics of the system. Traditional systems are governed by simple linear causality, in which A causes B, B causes C, and so on. In contrast, chaotic systems are ruled by nonlinear causality, in which an effect becomes part of the cause in future iterations of the pattern (Morgan 1997). In other words, causes and effects recursively feedback upon themselves and each other, further modifying effects and behavior patterns (Barnetson 2001; Cutright 2001).

As a result of this unique nature of causation, chaotic dynamics are extremely sensitive to initial conditions and flux (Morgan 1997). In linear systems, causes and effects have a proportional relationship, where inputs or errors result in effects that are similar in proportion and magnitude (Anderla et al. 1997). Thus, small changes lead to small effects, and large changes result in large effects. Because the relationship between causes and effects is proportional in linear systems, these systems unfold predictably from their original conditions (Murphy 1996).

In contrast, in chaotic systems, the relationship between inputs and errors is not proportional to their effects (Anderla et al. 1997). Small, often random, disturbances can produce large effects that reverberate throughout the system, creating unpredictable or novel effects (Morgan 1997). Even very small changes or errors can amplify exponentially (Anderla et al. 1997), making it virtually impossible to predict the final system configuration (Murphy 1996).

## The Butterfly Effect

The metaphor of the "butterfly effect," the principle that the flapping of a butterfly's wings in Peking, China, can influence weather patterns across the world in the Gulf of Mexico, illustrates the nature of change in chaotic systems.

According to this principle, an initial small change triggers a small change, which triggers another small change, and so on, ultimately resulting in a major change in the system. Chaologists, persons who study chaos theory (Marion 1999), contend that the old notion of "cause and effect" in which the butterfly *causes* a weather change in another part of the world should be abandoned in favor of the concept that the sum total of a large number of small changes converge to shift the system from the influence of one pattern to the influence of another pattern (Morgan 1997).

## Attractors

Order emerges from chaotic systems as a result of the influence of "attractors." Attractors are patterns or trajectories toward which the system gravitates (Marion 1999) and are the few elements in chaotic systems that have drawing or organizing power (Barnetson 2001). Attractors constrain chaos and create patterns (Cutright 2001), as well as establish the boundaries of the system and its general future direction (Swank 2001). The shape of the attractor limits the movement of the system (Stacey 2010), preventing it from spiraling completely out of control. Attractors represent the predictable aspects of the system to which it will return; since they are stable, when they are perturbed, attractors return to their original motion or shape (Marion 1999). Culture (Swank 2001), the environment, values, and resource availability (Barnetson 2001) have been identified as important attractors. Complex systems can fall under the influence of attractors that pull it into equilibrium or near equilibrium, or others that flip them into a new configuration (Morgan 1997), and may also cycle between two attractors. For example, the system may shift from periods of very high information flow to periods of very low informational flow (Stacey 2010).

## Bifurcation

When a system is pushed too far from its state of equilibrium, it nears the "edge of chaos" where it encounters bifurcation points (Morgan 1997). Bifurcations are points of tension between the status quo and alternative future states, which Morgan describes as "forks in the road (Morgan 1997, 264)," where there is potential for new development or for the system to rearrange itself around a latent or new order. At this point in its evolution, the system can come under the influence of either old or new dominant attractors (Morgan 1997) that can change the system's direction, character, or structure (Murphy 1996). Chaotic systems have the ability to self-organize in that they are able to recreate order and patterns despite continuous reaction to internal and external shocks to the system (Morgan 1997). They also organize around the principle of self-similarity; although everything else in the system may change, some aspects of the system remain the same (Swank 2001). This new order that results emerges naturally (Marion 1999), and its outcome cannot be predicted (Murphy 1996). Although the system will self-organize in unpredictable ways, its structure is limited by dominant attractors (Morgan 1997), so pandemonium does not result (Swank 2001).

## Applicability

Wallace and Fertig (2007) observe that chaos theory has a strong appeal to those who intuitively relate to the real-life messy nature of organizational functioning and change. However, Wallace and Fertig note there are major problems with the application of chaos theory to social systems, such as the lack of strong empirical evidence supporting the application of chaos theory to organizations and interventions derived from it. Also, the application of chaos theory, which is strongly deductive and theoretical at this point, is plagued by logical and conceptual flaws.

One of the major conceptual flaws in applying chaos theory to social system concerns the fundamental differences between physical and social systems. In contrast to physical systems (Barnetson 2001; Levy 1994), which are shaped by unchangeable natural phenomena, social systems are subject to human intervention (Levy 1994), as well as the intervention of external forces such as economic conditions, policies,

laws, etc. In contrasts to natural systems, human systems have distinctly human ends in mind, and their behavior is influenced by factors such as human will, intellect, and emotion (Dever 2001). Human agency can alter the parameters and structures of social systems (Levy 1994), but not those of natural systems. Furthermore, social systems possess information about themselves and the environment that they consciously or unconsciously act on it (Marion 1999).

As a result of these dissimilarities, some theorists argue that chaos theory cannot be applied directly to social systems and human interactions (Marion 1999; Stacey 2010). Marion (1999) argues the mechanistic nature of chaos theory renders it more appropriate for describing physical systems such as the weather, than for explaining or dealing with the intelligent behavior of humans. On the other hand, the same critics recognize its insights regarding the unpredictable nature of complex systems that can be useful as a metaphor to explain organizational functioning (Marion 1999; Stacey 2010).

## Implications

Levy (1994) and others maintain that chaos theory can provide guidance for interventions to help organizations achieve their goals. However, change agents must accept that in chaotic systems, doing the obvious thing does not produce the obvious desired outcomes because of their nonlinear dynamics (Swank 2001). Chaos theory implies observers should shift their understanding of organizations to realize that order does not emerge because someone or something devotes energy or takes action to bring it about. Instead, order emerges as a natural consequence of human interaction (Marion 1999). Finally, due to the unique dynamics of chaotic systems, intervention is likely to result in unintended consequences. For example, organizations that bring in consultants to obtain a specific result must accept the consultant's impact may be drastically different than expected (Swank 2001).

Those who study chaos theory highlight the futility of top-down approaches to managing change. They believe the idea of planning to predict and control the change effort and the notion of implementing specific goals and objectives is unrealistic (Swank 2001). Chaos theory implies that leaders can never know enough about a system to control it in any particular way (Morgan 1997), so long-term planning in chaotic organizations is very difficult, if not impossible (Levy 1994). Leaders should shed the belief that the future can be predicted if enough research is conducted (Marion 1999). Chaos theorists believe assessment efforts to more accurately measure initial conditions as a way of developing better intervention models will not yield better results (Levy 1994). They suggest that instead of spending large amounts of resources on forecasting and strategic planning, organizations are better served by developing strategic plans that take into account a multiple possible scenarios (Levy 1994).

Managers of change must become comfortable with the lack of control they are able to exercise over the system (Morgan 1997). One of the major contributions of chaos theory is its ability to organizational actors become comfortable with uncertainty and realize that "chaos may not be as bad as it seems" (Mossberg 2001, 206). Because of the complexity of chaotic systems, leaders will not always be able to determine why a specific strategy does or does not work. The dynamic nature of chaotic systems mandates that change strategies be adaptable. As the organization and environment evolve, it will be necessary to change guidelines and decision rules. As a result, leaders are advised to promulgate general guidelines to influence decisions and behavior, rather than specifying exact courses of action (Levy 1994).

Despite its unpredictable nature, chaologists maintain that change and chaos can be leveraged to the organization's advantage. In fact, incremental changes that might seem insignificant can be leveraged to bring about large effects that may trigger major transformations. These small incremental changes can build together to create an overpowering force. Leaders should focus their efforts on identifying a few high-leverage initiatives that are likely to have a major impact (Morgan 1997). For example, the small addition of one new computer or other technological

innovation can lead to substantial or even unexpectedly large changes (Levy 1994).

## Conclusion

Chaos theorists stress the chaos model does not infer leaders should be passive. Instead, it points to areas where strong leadership is essential (Barnetson 2001), such as identifying "forks in the road" where systems are particularly amenable to change (Morgan 1997). Recognizing that too much structure leads to stability, but too little leads to chaos, leaders should attempt to strike a balance between the two, in order to produce a dynamic that pushes a system toward "the edge of chaos" where their organization can undergo significant change (Stacey 2010). Leaders can also create new contexts that break the hold of the dominant attractor patterns in favor of new ones, so that appropriate forms of self-organization can occur. New contexts can be created via new understandings or specifying new or different reference points or minimal specifications (Morgan 1997). It is also the leaders' role to identify changes that require minimal effort, but have the potential to yield maximum outcomes (Swank 2001). Finally, leaders should serve as exemplars of maintaining a sense of purpose and direction, while remaining flexible and open to accommodation and adaption when responding to constant flux (Dever 2001).

# Charters of Budget Honesty

Usman W. Chohan
UNSW Canberra, Business School, University of New South Wales, Canberra, ACT, Australia

## Synonyms

Accountability in the budget process; Budget discipline; Budget documentation; Budget reform; Fiscal rules

## Definition

A "Charter of Budget Honesty" is a document that outlines the goals of a budget process, suggests constraints and rules for budget discipline, and sets the general practice of preparing and presenting budgetary information.

## Introduction

Many countries are riddled with a set of fiscal problems that appear to be worsening over time, including a long-term reliance on borrowing, a difficulty in managing shocks to their economic systems, and a high degree of opaqueness in the conduct of the fiscal process. Different countries have sought different remedies for these three problems, and one possible approach that has gained increasing attention around the world is the enshrinement of *fiscal rules*, such as debt limits and balanced-budget requirements, sometimes in a sort of fiscal constitution or abiding document, which is an instrument referred to here as a "Charter of Budget Honesty."

A Charter of Budget Honesty is a document that lays out the manner in which the budget system of a country should be managed. It may include suggestions for constraints and rules that encourage fiscal discipline, as well as for the general practice of preparing and presenting budget information, and may even outline the broader goals and objectives of the budget process. The most well-known, and most well-established, among such documents is the Australian *Charter of Budget Honesty* (1998), which over two decades has come to form a cornerstone of the country's budget process and has driven its budgetary culture both in terms of belief and practice.

This entry discusses the reasons for the charter's creation, provides a general outline of its moving parts, and then considers its strengths and weaknesses as noted by various budget scholars (see also Robinson 1996; Kopits 2001; Wanna 2010; Kirchner 2011; Chohan 2017). This leads to the question of whether other countries might not gain from such an instrument and then to a consideration of the circumstances in which a charter may prove useful in different country-contexts.

## The Australian Charter of Budget Honesty

Australian states have a long history of fiscal rules dating back to the nineteenth century, and some of those provisions are still in place today. However, it was in the latter part of the twentieth century that a national consensus arose for fostering budget discipline through fiscal rules. This change was driven by wider reforms occurring throughout the Anglosphere during the 1980s, as part of Reagan-Thatcherite moves to "roll back the state." In particular, it was neighboring New Zealand, which had passed the *Fiscal Responsibility Act* (1994) to consolidate government finances that incited both the Australia and the UK to pass similar budget responsibility laws. The common threads between these laws were: an emphasis on long-term fiscal objectives, statement of fiscal goals, a demanding set of requirements for fiscal reporting to the public, and guidelines for managing fiscal policy. At the time that it was enshrined, the Australian charter was thought to represent the highest standard of fiscal policy legislation in the world (Wanna 2010), both in terms of its rigorous requirements and in terms of its far-reaching scope.

The emphasis of the Australian charter is on "sound fiscal management," with a view to moderating economic fluctuations, ensuring adequate national saving, and pursuing government revenue and expenditure strategies that allow for reasonable stability, while also maintaining the integrity of the tax system, all with regard to the impact of these fiscal decisions on future generations (Chohan 2017). The charter contains several moving parts that work in concert to fulfill the requirements stipulated in the document. They also require several branches of government to work together, including the legislature, the Treasury, and the Department of Finance. The component parts are listed in Table 1.

In 2011, the Australian charter was amended to incorporate the newly created Parliamentary

**Charters of Budget Honesty, Table 1** Component parts of the Charter of Budget Honesty (Source: Chohan 2017)

| Component | Month | Department | Objectives |
|---|---|---|---|
| Fiscal strategy statement (FSS) | May | Treasury | To increase public awareness of the Government's fiscal strategy and to establish a benchmark for evaluating the Government's conduct of fiscal policy |
| Mid-year economic and fiscal outlook report (MYEFO) | November | Treasury | To apprise the public, the legislature, and the executive branch of any outstanding events or changes that may affect the budget's trajectory |
| Budget outcomes report (BOR) | August | Department of Finance | Summarizes the postbudget financial statements |
| Intergenerational report (IR) | March (every 5 years) | Treasury | To show how changes to Australia's population size and age profile may impact its economic growth, its workforce, and its public finances over the next 40-year period |
| Pre-election fiscal outlook (PEFO) | 2 months before an election | Treasury and Department of Finance | To update budget estimates and divulges to the public any decision of government since the last economic update was published |

Budget Office (PBO) as well. The PBO is mandated to cost proposed budget policies for the opposition and thus help to level the playing field between political parties occupying the government and the opposition.

The proponents of the charter's efficacy argue that these moving parts together form a more cohesive framework for budgeting, and also assert that the charter creates a more demographic space for practicing "sound fiscal management," which is the guiding principle of the charter itself. They further argue that the charter is one of the reasons that public debt in Australia has remained at manageable levels since its instatement in 1998 (Australia has low public debt but very high private household debt). Indeed, Australia has not experienced a proper recession in the past 25 years. Yet despite these laudatory arguments, the charter has come to face several types of criticism from various budget scholars as well.

## Criticisms

In the nearly 20 years since its promulgation, the charter has been criticized for several reasons, by budget scholars, government officials, and parliamentarians alike. In the first instance, the very definition of "sound fiscal management" that the charter claims to adhere to is highly ambiguous and open to "interpretive approaches" (Wanna 2010), with a subjective element in the term "budget honesty" itself. Second, some scholars assert that there are not sufficient benchmarks by which to gauge the adherence of budget policy in Australia to the abstract values stipulated in the charter (see Kirchner 2011). Such benchmarks are often referred to as fiscal rules (see Kopits 2001), mentioned in the introductory portion of this chapter, and tend to be more commonly found in European countries. But there is an inherent tradeoff between imposing exacting rules in the budget process for the sake of discipline, versus the flexibility that governments may require to respond to economic shocks. If fiscal rules are too stringent, they detract from the maneuverability of governments that require flexible fiscal strategies during shocks and crises. To this point, the charter can only encourage fiscal discipline, but it cannot *compel* governments to do so. In order for the charter to be able to compel governments towards budget discipline, certain additional requirements would need to be met, including clear and unambiguous fiscal targets, strong internal and external oversight of budgets to assess levels of compliance, and a strong coherence between the letter of the law and the spirit. For those who argue that stronger benchmarks and rules should be set, it must be remembered that there is no consensus on what an ideal fiscal target is (Chohan 2017) and that political parties can differ in their fiscal philosophy, with some preferring strictly balanced

budgets, while others treating reasonable borrowing and planned deficits as normal fiscal policy.

A third criticism emerges from the logic that "less is more," because on several occasions, parliamentarians, government officials, and scholars have found that the charter requires copious amounts of budget data that actually cloud policy judgement. This is because the enormous quantities of budget data can overwhelm policy makers and thus nullify the original intent of the charter as a document that would support clearer fiscal thinking. In this sense, the charter is seen to have devolved more into a series of rituals that conforms more to the letter than the spirit of transparency. Even as this has been found to be true by several commissions and enquiries on the budget process, detractors of this argument insist that it is better to have too much information than too little and to omit data from budget presentation would itself require subjective judgement-calls.

Fourth, despite the stipulations of the charter, the actual budgetary architecture of the country is bound by constitutionally defined parameters. For example, the Australian constitution sets rules on what the Senate and the House of Representatives must do with respect to spending bills and annual appropriations, and the charter cannot override such constitutional rules. However, in liberal democracies, the constitution holds primacy and should only amend after considerable deliberation and after a very broad legislative consensus is reached.

A fifth criticism emerges from the experience of other countries regarding fiscal rules, which shows that regulation for balanced budgets or fiscal discipline does not necessarily guarantee sound fiscal management. This is seen in states that have had balanced-budget rules but have still ended up defaulting on their debts, as for example the state of New York did in 1974 despite its constitutional balanced-budget requirements. However, this argument is not as robust because it relies on a counterfactual fiscal consideration: how many more countries *would have* defaulted if

**Charters of Budget Honesty, Table 2** Preponderant criticisms of the Australian Charter of Budget Honesty (Sources: Wanna 2010; Kirchner 2011; Chohan 2017)

| Criticism | Explanation | Counterarguments |
|---|---|---|
| Vagueness and ambiguity | The charter adheres to vague principles such as "sound fiscal management" and "budget honesty," which are open to interpretive approaches and subjectivity | It is difficult to concretize or assess ideas such as "sound management" and "honesty" without subjectivity |
| Lack of specific benchmarks | Concrete benchmarks in the charter might help to relieve some of the ambiguity | Imposing stringent fiscal rules in the charter detracts from the flexibility that governments may need in crises. There are also no ideal fiscal targets that would themselves not be free from subjectivity |
| Less is more | The charter produces excess amounts of data that actually make it more difficult to think clearly about budgets. The charter has devolved into a set of rituals of paperwork | It is better for transparency to have too much information than too little, and striking the balance would require subjective judgements in terms of materials to omit |
| Limited by existing architecture | The actual impact of the charter is limited because it cannot override the principle pillars of budgeting, such as the national constitution | In liberal democracies, the constitution holds primacy and should only amend after considerable deliberation and after a very broad legislative consensus is reached |
| Does not prevent problems such as defaults | Countries and states with fiscal rules such as balanced-budget requirements can and do still default and thus violate those rules (e.g., New York 1974) | Fiscal rules are not guarantors, but how many more countries and states *might have defaulted*, if they *had not had* fiscal rules? Relies on the unprovable counterfactual |
| Stalls substantial reform | The charter has actually stalled meaningful reform by providing a cover to politicians for the exhortation of rhetoric such as "fiscal discipline" in lieu of actual policy initiative | N/A |

they *had not had* fiscal rules? As it is not possible to prove the counterfactual, fiscal rules and other fiscal discipline measures continue to warrant attention.

A final criticism of the charter is that it has actually helped to stall meaningful fiscal reform by creating a mechanism that relies excessively on political rhetoric but which muddles substantive policy effort (see Wanna 2010). Indeed, although Australia was considered a pioneer in budget reform in the late twentieth century, many scholars argue that today it has ended up as a laggard in reform, while at the same time, Australian politicians regularly exhort the importance of fiscal discipline and careful fiscal planning, without engaging in any substantial fiscal effort (Wanna 2010). This implies that the rhetoric of the charter, through vague terms such as "sound fiscal management," misdirects the impetus of budget reform by couching political energies into regular exhortations in lieu of policy initiative.

These criticisms, along with their main counterarguments, are listed in Table 2.

## Conclusion

Despite the aforementioned criticisms of the Charter of Budget Honesty, the difficulty persists that many countries face a host of fiscal pressures that only appear to be getting worse. Most notably, they are continuing a long-term reliance on deficit borrowing, they continue to struggle to manage economic shocks, and they generally seem to conduct the fiscal process with varying degrees of opaqueness. The charter is touted as an example of a measure towards addressing, at least in part, the compounding pressures generated by those problems. However, a Charter of Budget Honesty, or any other document for that matter, alone is not sufficient to confront such deep-seated issues. That is why, if a charter is introduced as a stand-alone document in other countries, it is unlikely to make a substantial contribution, given the aforementioned criticisms that even a fairly robust budget system such as Australia's now incur. However, if the charter is introduced as part of a broader remit of substantial reform, with wider implications for fiscal discipline that aim to bring greater shifts in fiscal practice, then such a charter might prove of substantial benefit within a larger and more cohesive framework.

# Child Welfare Agency Management: Accountability Relationships and Systemic Change

Ariel Alvarez
Political Science and Law, Montclair State University, Montclair, NJ, USA

## Synonyms

Responsibility, answerability, and liability

## Definitions

Child Welfare Agency Management
Is the management and supervision. Resources to assist child welfare managers, supervisors, and administrators provide effective leadership and build and maintain a skilled workforce. Effective management and supervision enhances agency and staff performance and can lead to improved outcomes for children, youth, and families.

Accountability
The fact or condition of being accountable; responsibility.

Systemic Change
Is "change" that pervades all parts of a system, taking into account the interrelationships and interdependencies among those parts

Child welfare agency (CWA) public administrators (PAs) are responsible for managing multiple accountability requirements and implementing institutional change to improve agency performance (Johnston and Romzek 1999; Lu 2015). Using Romzek and Dubnick's (1987) conceptual foundation of accountability relationships, the purpose of this essay is to explore within a real-world context factors affecting CWA PA management of accountability relationships during periods of implemented systemic change.

State CWAs are complex bureaucratic systems with PAs holding autonomous sources of authority and control over internal decision-making and actions while simultaneously being held accountable for agency compliance with performance standards set and monitored by external state and federal governing bodies (Johnston and Romzek 1999; Kloby 2012). PAs often manage accountability relationships within the context of a state CWA that is underfunded, understaffed, and under resourced with frequent leadership changes, ineffective quality assurance mechanisms in place, and an overwhelmed capacity to perform tasks at mandated levels (Shookhoff 2012). To meet accountability performance standards within required reporting mechanisms, CWA PAs engage in an ongoing process of assessing agency functioning and implementing systemic change to address inefficient and ineffective system policies and practices (Bertelli 2004; Blome and Steib 2007; Vincent 2012). This essay begins with the conceptual foundation based on Romzek and Dubnick's (1987) four dimensions of accountability followed by a discussion of factors facing PAs during periods of CWA institutional change.

## Four Dimensions of Accountability

Accountability plays an integral role in directing and shaping publically administered agency operations, assessment mechanisms, and performance reporting (Romzek 2000; Romzek and Dubnick 1987). Romzek and Dubnick developed and Johnston and Romzek (1999) later expanded on a framework for understanding accountability relationships within the context of bureaucratic, legal, professional, and political sources of authority and control over agency performance expectations, decision-making, and actions (see Table 1).

### Accountability Sources of Authority and Control

Accountability relationships can be loosely coupled, competing, and contradictory (Johnston and Romzek 1999; Romzek and Dubnick 1987). Managing accountability relationships involve identifying and matching the accountability standard with the appropriate personnel, assessment measures, and reporting mechanisms (Romzek and Dubnick 1987). PA power to direct institutional decision-making and action varies dependent on the degree of internal and external sources of authority and control shared between the agency and an internal or external accountability agent (Romzek and Dubnick 1987).

Internal sources of authority arise from bureaucratic and informal social relationships and rely heavily on professional judgment and quality assurance systems embedded in internalized forms of practice (Blome and Steib 2007; Romzek 2000; Romzek and Dubnick 1987). External sources of authority rest in legal and formal sources of power external to the agency typically derived from state and federal legislative mandated policies and reporting mechanisms that

**Child Welfare Agency Management: Accountability Relationships and Systemic Change, Table 1** Four forms of accountability

Dashed grid lines indicate permeable boundaries between different accountability relationships

Source: Romzek and Dubnick 1987, pp. 229, 230; Romzek 2000, p. 418; Kloby 2012, p. 30

influence agency functioning (Romzek and Dubnick 1987). A high degree of control provides PAs with considerable autonomy in decision-making and directing activities; a low degree of control arises when an external agent controls the range and depth of administrative choices and activities (Romzek and Dubnick 1987). In highly bureaucratic agencies, PAs generally retain the ultimate control and authority over daily operations while relinquishing authority and control to an internal or external agent linked to specific accountability relationship and performance expectations (Romzek and Dubnick 1987).

## Accountability and the State Child Welfare Agency

Highly bureaucratized CWAs operate under a division of labor, decentralization of functions, and compartmentalization of authority and control based on agency position (Romzek and Dubnick 1987). Internal and external accountability requirements are linked broadly to tasks performed, strategies used by PAs and supervisors, and the governmental and political environment in which the CWA functions (Romzek and Dubnick 1987). Managing CWAs involves identifying practice-based outcomes that balance the interests of accountability entities while allowing PAs' autonomy to implement policies and strategies to achieve accountability performance standards (Vincent 2012).

In CWAs, the process of accountability becomes muddled as PAs work to manage multiple performance expectations with differing sets of standards, assessment mechanisms, reporting procedures, and sometimes competing interests (Kloby 2012; Romzek 2000). PAs and CWA personnel often experience confusion, frustration, and stress in dealing with cross pressures from multiple or conflicting accountability expectations within existing bureaucratic rules, policies, and procedures (Shookhoff 2012).

## Four Sources of Accountability in the Context of CWA Administration

Based on Romzek and Dubnick's (1987) four dimensions of accountability, CWA PAs' ability to achieve accountability compliance with performance expectations is dependent on their ability to manage bureaucratic, legal, professional, and political accountability relationships that typically co-occur (Romzek 2000). Agency leaders, supervisors, and front-line personnel operate under different levels of autonomy, authority, and control with PAs focused primarily on legal and political accountability and supervisors and case workers

generally focused on bureaucratic and professional accountability requirements (Romzek 2000; Shookhoff 2012).

**Bureaucratic accountability and the CWA.** A primary role of the CWA PA is to identify and prioritize accountability expectations and performance requirements and organize superior-subordinate relationships across the wide-range of activities and personnel linked to clearly stated rules and regulations dictating daily tasks and performance requirements (Romzek and Dubnick 1987). Bureaucratic accountability involves supervisor-subordinate relationships in which the bureaucratic structure of the CWAs provides the PA with a high degree and source of internal control over policy decision-making and actions to direct, asses, and enforce compliance with internal norms, rule, policies, and actions by those at subordinate agency levels (Kloby 2012; Romzek and Dubnick 1987). Autonomous sources of authority and control for decision-making, defining performance standards, and taking action decrease with movement down the CWA bureaucratic hierarchy from high-level leaders to front-line workers (Romzek 2000; Romzek and Dubnick 1987). However, PA sources of authority and control linked to accountability expectations often are filtered through accountability entity appraisal and oversight mechanisms that can contribute to decision delays and slow implementation of corrective policies and procedures to identified system problems (Romzek and Dubnick 1987).

**Legal accountability and the CWA.** The legal accountability relationship involves two autonomous entities engaged in a formal lawmaker (accountability entity)-law executor (CWA) relationship (Romzek and Dubnick 1987). The legal accountability entity holds considerable sources of control and authority to define performance expectations, dictate the creation and application of assessment mechanisms, set timelines for performance outcome compliance, and impose legal sanctions for noncompliance (Romzek 2000; Romzek and Dubnick 1987; Shookhoff 2012). With legal compliance the key driver of legal accountability, the lawmaker (e.g., federal agency, state legislature, or the court) possesses a high degree of external agency control over internal accountability actions and expectations that reduces CWA PA bureaucratic decision-making discretion and autonomy in key areas of agency operations and functioning (Romzek and Dubnick 1987).

CWA PAs manage legal accountability relationships within an environment that provides a high degree of accountability with a low degree of internal agency decision-making and action autonomy in key areas of agency operations and functioning (Romzek and Dubnick 1987). Operating within the bounded obligations of legal accountability relationships, CWA PAs face increased complexity and decreased authority and control over implementing systemic change processes that align with state and federal policy and funding mandates while engaged in oversight of CWA operations.

**Professional accountability and the CWA**. CWA PAs rely on a professional core of experts trained with a specific set of knowledge and skill necessary to provide the appropriate level of clientele services (Romzek and Dubnick 1987). Trained workers rely on professional standards, norms, and values to guide decision-making and practice within agency policy and procedural rules (Romzek 2000). The professional accountability relationship is marked by PA deference in a - layperson-expert relationship with some agency internal sources of authority and control shifted from agency leaders to the subordinate skilled professional's expertise in the application of best practice standards (Johnston and Romzek 1999; Romzek 2000; Romzek and Dubnick 1987).

The management of multiple accountability relationships simultaneously can affect the professional accountability relationship by decreasing the level of decision-making autonomy and discretion provided the professional core (Bertelli 2004; Romzek and Dubnick 1987). CWAs are highly bureaucratic and the professional core often is subject to considerable supervisory control resulting in relatively low degrees of autonomy in work arrangements and decision-making (Romzek 2000; Romzek and Dubnick 1987). Constrained decision-making autonomy of the professional core arise when some sources of authority and control that encompass professional child welfare practice standards, principles, and

values are transferred to the accountability entity through required operational and performance policies and procedures (Bertelli 2004; Romzek 2000; Romzek and Dubnick 1987). Political, governmental, and bureaucratic pressures arising out of accountability relationships often weaken professional autonomy and lose some of the beneficial aspects of professional expertise and service (Blome and Steib 2007).

**Political accountability and the CWA.** Political accountability typically arises from accountability relationships with external political or governmental agents that pass laws and/or provide budgetary funding and engage in external institutional oversight (Blome and Steib 2007). The political accountability relationship involves a high degree of PA autonomy and discretion over internal decision-making and operations with the external agent holding high sources of authority and control over defining performance expectations that influence agency operations (Romzek 2000). State and federal political accountability relationships can facilitate or hamper the ability of CWA PAs to implement or sustain policies and procedures that maintain an agency structure supporting programs, services, and a trained professional staff (Blome and Steib 2007).

Important to the political accountability relationship is identifying the constituent and the policy priorities and programmatic needs to which the PA is expected to be responsive (Johnston and Romzek 1999; Romzek and Dubnick 1987). PA responsibilities involve identifying programmatic needs, clientele and policy priorities, and accountability responsibility for addressing CWA deficiencies (Blome and Steib 2007; Johnston and Romzek 1999; Kloby 2012; Romzek and Dubnick 1987). The key driver is responsiveness to contractual responsibilities to CWA clientele in an administrator representative-constituent relationship (Romzek and Dubnick 1987).

## CWA Systemic Change and Managing Accountability Relationships

In managing CWAs, PAs frequently are confronted with seven common factors that can affect accountability relationships, performance compliance, and systemic change that include: (a) incomplete diffusion of agency policies and procedures, (b) agency capacity to support diffusion of systemic change, (c) funding/budget to support institutional operations and change processes, (d) leadership instability, (e) data management, (f) assessment and quality assurance, and (g) managing performance-based contractors.

### Incomplete Diffusion of Agency Policies and Procedures

Translating new policy, procedure, and professional practice changes into consistent and sustained performance improvements take multiple interventions, systemic commitment, and time. Within the context of accountability relationships, CWA PAs must examine and develop an in-depth understanding of systemic functioning, policy effectiveness, practice weaknesses, and working relationships with internal personnel and external stakeholders across the state child welfare system. Poor diffusion of new policies and procedures across the bureaucratic hierarchy within the CWA system contribute to the incomplete utilization of strategies, policies, and procedures that match performance-linked accountability requirements (Kloby 2012; Romzek and Dubnick 1987; Shackelford et al. 2007; Shookhoff 2012).

Developing a plan for systemic change to improve agency functioning involves a complex process of defining performance outcomes matched to measurable action steps. A significant contributor to inadequate performance improvements following change implementation is a plan with insufficient detail and unclear strategies linked to action step implementation and performance assessment mechanisms (Romzek and Dubnick 1987; Shookhoff 2012; Vincent 2012). The change process also can be affected by decisions and actions to ensure compliance with multiple state and federal child welfare program and service mandates that contribute to a shifting of resources and focus away from implementation of a systemic agency change plan toward meeting federal and state legal accountability requirements (Kloby 2012).

### Agency Capacity to Support Diffusion of Institutional Change

CWAs must demonstrate compliance with multiple accountability relationships and performance expectations (Vincent 2012). A significant contributor to CWA operations at mandated performance levels is agency capacity to support institutional change. PAs instituting agency change in response to accountability performance deficiencies often are confronted with a bureaucratic system that lacks sufficient institutional capacity to support strategic planning, change implementation, quality review, data acquisition, and reporting requirements related to performance outcomes (Shookhoff 2012). Poor diffusion of new CWA policies and procedures to bring agency performance in compliance with accountability standards often is associated with an overwhelmed agency marked by financial constraints, limited resources, transitory leadership, an insufficient workforce, inadequate quality assessment mechanisms, poor personnel understanding of new policies and procedures, and problems managing external PBC service providers (Vincent 2012).

The bureaucratic organizational structure of CWAs can create overlapping and unclear levels of authority and control that contribute to delays in strategic decision-making and confusion about accountability relationship responsibilities along the bureaucratic hierarchy (Bertelli 2004; Shookhoff 2012; Vincent 2012). Agency capacity for change is affected by clarity of PA authority and control within the bureaucratic hierarchy for strategic decision-making, clarifying worker role delineations and responsibilities, and diffusing new policies and procedures throughout the CWA system (Kloby 2012; Romzek 2000; Shookhoff 2012). The top-down bureaucratic structure typical of CWAs often leads to the implementation of policies and procedures with little communication and input from field-level supervisors and frontline workers. Systemic diffusion of new policies and procedures is inhibited by poor communication that contributes to low morale and disengagement in the change process among workers who feel alienated, confused, anxious, and resistant to change (Kloby 2012; Shookhoff 2012).

**Iterative and incremental change process.** Successfully managing multiple accountability relationships requires CWA PAs to engage in an iterative process of identifying critical agency tasks, defining professional standards, clarifying personnel role and responsibility expectations, and implementing policy and procedural action plans linked to measurable accountability performance requirements (Kloby 2012; Romzek 2000; Shookhoff 2012). A significant contributor to CWA PA faltering early in efforts at systemic change and the diffusion of policies and procedures arises from a mismatch between accountability requirements, performance outcome compliance timelines, and agency capacity to support change-related action steps (Kloby 2012; Shookhoff 2012; Vincent 2012).

Managing multiple accountability relationship while facilitating systemic change is most successful through the incremental implementation of a change plan that is comprehensive, communicated at all levels of the agency system, delineates agency personnel roles and responsibilities, and provides specific action-oriented steps that are linked clearly to new policies and procedures (Kloby 2012; Romzek and Dubnick 1987). An iterative and incremental process provides CWA PAs with greater flexibility in responding to system changes, identifies needed adjustment, implements more focused strategies to reduce identified performance gaps, engages agency personnel and external service providers more fully in the change process, and allows time for the system to adjust to policy and procedural changes (Romzek and Dubnick 1987).

### Funding/Budget to Support Institutional Operations and Change Processes

State legislatures play a critical role in CWA operations by allocating funding and enacting child welfare statutes that facilitate or inhibit agency management and implementation of changes to address performance deficiencies (Shookhoff

2012). State CWAs are reliant on state governmental and federal funding that is affected by fluctuating economic conditions, state revenue shortfalls, budget cuts, and shifting of funding allocations across the CWA system (Shookhoff 2012). This reliance on government fiscal support for agency funding places CWAs in a dependent political accountability relationship with the state that affect CWA programs and services directly addressed in accountability requirements (Kloby 2012; Shookhoff 2012).

Accountability relationship can provide CWA PAs sources of authority and control that can be leveraged to compel state leaders and legislatures to address funding decisions and current laws related to legal and political accountability expectations. For example, through litigation by child advocacy groups over severe CWA deficiencies leading to poor agency performance and child endangerment, an accountability relationship is established with the court that provides CWA PAs with sources of authority to compel state governments and legislatures to increase funding or enact child welfare legislation to support CWAs operations and system change plans (Kloby 2012; Shookhoff 2012).

### Accountability, Leadership Instability, and Change

CWA leader transitions can alter accountability relationships and PA sources of authority and control for policy and practice decisions and management of daily agency operations (Bertelli 2004; Vincent 2012). Leadership stability promotes continuity of agency knowledge in relation to specific accountability relationships, reduced systemic uncertainty, anxiety, and confusion about sources of authority and control, and facilitates personnel, stakeholder, and community trust, confidence, and engagement (Bertelli 2004; Vincent 2012). Unfortunately, CWAs often experience leadership instability from frequent mid-level and high-level leadership transitions in key decision-making and management positions. Leadership instability can impede the diffusion of new policies and procedures with the loss of agency knowledge and experience linked to accountability expectations (Bertelli 2004; Vincent 2012). The diffusion process is slowed as PAs spend time understanding their role and responsibilities, create a plan for prioritizing and sequencing the implementation of new policies and procedures, and becoming acclimated to the agency structure, norms, and culture (Bertelli 2004; Vincent 2012).

CWA PAs serve as the main sources of authority and control over resource allocation, decision-making, prioritizing, clarifying, and assigning to agency personnel responsibility for implementing agency policies and procedures to achieve compliance with accountability expectations (Kloby 2012; Romzek 2000; Shookhoff 2012). Frequent leader transitions result in a loss of familiarity with agency personnel and operations that contributes to decision-making delays as new leaders establish accountability relationships, assess performance, and implement systemic changes in policies and procedures. Leader transitions often bring different ways of managing and uncertainty among agency personnel about roles and responsibilities linked to policies, strategies, and actions (Bertelli 2004; Vincent 2012). Frequently, the result is heightened anxiety, low morale, and poor engagement among workers attempting to adjust to differences in leader expectations, decision delays, unclear delineation of leader and worker roles and responsibilities, inconsistent application of new policies and procedures, and skepticism about new policies and procedures due to past CWA failures to improve agency performance (Bertelli 2004; Kloby 2012; Shookhoff 2012; Vincent 2012). CWA personnel can become overwhelmed and frustrated by a pace of change with too many new policies and procedures imposed at one time in a system lacking sufficient resources and support for field-level supervisors and front-line workers to handle several changes simultaneously (Shookhoff 2012; Vincent 2012).

### Accountability, Data Management, and Change

A bureaucratic accountability factor that takes prominence with PA management of CWA accountability relationships and implementing systemic change is the ability to track a variety of agency performance indicators specific to accountability performance requirements using data that is accurate, timely, accessible, and reliable. CWA data management and reporting for state and federal accountability agents is provided through the State Automated Child Welfare Information System (SACWIS) (Shackelford et al. 2007). The SACWIS data management system is used to link agency administrative, case management, and financial operations with external provider activities. SACWIS is intended to support decision-making, communication across the agency system, information exchange, case management, quality assurance assessment, and performance reporting through a centralized system (Shackelford et al. 2007).

CWA PAs are responsible for ensuring the effective utilization of SACWIS for agency operations and meeting accountability reporting requirements (Shackelford et al. 2007; Shookhoff 2012; Vincent 2012). Inadequate training and understanding of SACWIS across the agency system (especially field-level supervisors and front-line workers) and outside agents that conduct CWA-related business (e.g., performance-based contractor service providers, educational institutions, and the court system) contribute to missing or inconsistent documentation (Kloby 2012; Shackelford et al. 2007). SACWIS data deficiencies weaken case management, agency assessment, data derivation in a form that provides relevant information to support institutional processes, and performance tracking and reporting (Kloby 2012; Shackelford et al. 2007).

Ineffective utilization of SACWIS for data management and performance tracking often is attributed to data management problems, extra time needed to train internal personnel and external program and service providers, and slow diffusion of SACWIS system use across the entire agency system that experiences a high turnover rate among front-line workers. Factors that contribute to the inability to track systemic change and demonstrating compliance with accountability requirements often are attributed to SACWIS upgrade interruptions, inadequate training and technical support, redundancy of data input requirements, inaccessible and unreliable data, and data input and extraction difficulties that affect agency capacity to complete tasks and conduct quality assessment (Kloby 2012; Shackelford et al. 2007).

### Accountability, Assessment, Quality Assurance, and Systemic Change

Quality assessment is critical to providing CWA PAs with information about agency functioning that support decision-making and action linked to meeting accountability performance standards and reporting requirements (Kloby 2012; Shackelford et al. 2007). CWA PAs generally engage in identifying, defining, and developing measurable assessment standards for specific accountability expectations and linking them to the appropriate responsible personnel and sources of authority and control (Romzek and Dubnick 1987; Shackelford et al. 2007; Shookhoff 2012; Vincent 2012). It can take several years for CWA PAs to develop and have in place a quality assurance program that produces credible and reliable internal audits sufficient to identify and assess strategy and policy change affects on agency functioning.

SACWIS data management weaknesses, time spent by CWA PAs aligning quality review strategies and procedures with accountability performance outcome standards, and a prolonged learning curve for new personnel to become proficient using the system contribute to PA ability to conduct comprehensive and reliable internal quality assurance reviews (Kloby 2012; Shackelford et al. 2007; Shookhoff 2012; Vincent 2012). Absent or inadequate quality assessment mechanisms across the CWA system coupled with the inability to acquire consistent and reliable

assessment data from external service providers contribute to a weakened ability to track agency performance and identify problem areas causing delays in decision-making, expedient adjustment to policies and procedures to improve agency performance, and demonstrate performance compliance (Kloby 2012; Johnston and Romzek 1999; Shackelford et al. 2007).

### Accountability, Managing PBCs, and Change

With the intent of reducing operational costs and improving CWA service provision, many state legislatures now mandate the privatization of some CWA programs and services through performance-based contractors (PBCs) (Lu 2015). A bureaucratic supervisory-subordinate accountability relationship is established between the CWA and PBC with PAs responsible for ensuring compliance with multiple accountability expectations of the PBC provider carrying out agency-specific activities (Johnston and Romzek 1999; Lu 2015).

The utilization of PBCs changes the scope and nature of accountability relationships with service provision, funding, and accountability responsibilities split between the private contracting agency and the CWA (Johnston and Romzek 1999; Lu 2015). The complexity of the contract-management relationship requires explicitly defined divisions of responsibility, outcomes, and assessments linked to performance expectations and accountability requirements (Johnston and Romzek 1999).

Oversight of PBCs by CWA PAs often is hampered by inadequate performance assessment mechanisms; lack of timely, accurate, and reliable data aligned with accountability performance requirements; and ongoing ambiguity and uncertainty about accountability responsibilities and sources of authority and control between the CWA and the PBC (Johnston and Romzek 1999; Kloby 2012; Lu 2015; Shackelford et al. 2007). Limited CWA PA authority and control over private agency operations and service provision often contributes to performance compliance failures to meet performance outcomes due to difficulty managing accountability mechanisms with the PBC system (Johnston and Romzek 1999; Lu 2015).

CWA PA management of accountability expectations connected to PBC programs and services are weakened, especially during periods of agency change. PAs frequently encounter inadequate monitoring due to systemic problems with oversight processes and lack of expertise by the PBC agency to integrate new policies and procedures into their institutional process and to conduct effective data acquisition and evaluation of PBC programs and services linked to CWA accountability requirements (Johnston and Romzek 1999).

## Conclusion

CWA PAs' focus on accountability requirement compliance can lead to a degrading in service quality due to increased attention given to specific accountability relationships and requirements rather than on creating a learning organization with service quality based on professional best practice standards and an emphasis on an iterative process of assessment, reflection, change, and performance standards integrated into agency strategies, culture, and daily operations. In managing multiple accountability relationship expectations, PAs work to identify the internal and external accountability agents, clarify the sources of authority and control linked to expectations across multiple accountability relationships, assess and make policy and procedural changes linked to specific performance expectations, and develop appropriate assessment mechanisms to demonstrate compliance with accountability requirements (Romzek and Dubnick 1987).

During systemic change to address agency deficiencies, greater transparency about the new changes and open communication can help reduce accountability ambiguity and improved awareness, understanding, and application of policy and procedural responsibilities linked to

accountability requirements (Kloby 2012; Shookhoff 2012; Romzek 2000; Romzek and Dubnick 1987). Success achieving performance outcomes is facilitated through greater emphasis placed on understanding accountability relationships and engaging system-wide involvement in the diffusion of systemic changes to meet accountability expectations, especially among governmental leaders, state legislatures, judges, attorneys, and external service providers (Kloby 2012; Romzek 2000; Shookhoff 2012).

# Chile's Political Party System

Marcelo Mella-Polanco
Department of History, Universidad de Santiago de Chile, Santiago, Chile

## Synonyms

System of government by political parties in Chile

## Definition

The historical evolution of the party system in Chile, questions the theoretical conditions that favor the institutionalization of parties and democracy. Persistent conditions that seem unfavorable, are compensated by lessons learned by the elites and the parties, which currently allow the Chilean system to be recognized as one of the most politically developed in the Region.

## Introduction

At the Latin American level, the party system in Chile stands out due to its institutionalization and stability in a context of high fragmentation and polarization. This unusual combination stems from a historical process of State formation based on the strengthening of presidential power over the endemic conflict of the Chilean political elite. This tendency allowed for a limitation of the autonomy of the State on behalf of the elites and was facilitated by a culture prone to compliance and order, which was referred to as "the weight of the night" by Diego Portales, forefather of the Republic and the Presidential System in Chile. (Jocelyn-Holt 1997).

This institutionalization and stability has been an adaptive response from party organizations in the face of the deep conflicts that marked Chilean history during the nineteenth and twentieth centuries, which has allowed the party system to function as a stabilizing agent between social change and the strategic capacity of the elites

(Scully 1992). The intensity of these conflicts or critical conjunctures prompted the reordering of the system, the change of its logic in terms of commitment and competition, as well as the formation (or decline) of party organizations. This role of political conflict along with the adaptations of the party system has allowed Chile to be among the most stable and consolidated democracies in the continent.

The historical evolution of the party system and its rendering in institutional stability have sparked from conditions such as divisions in Chilean society (Lipset and Rokkan 1967) and institutional opportunities/restrictions at each of these junctures (Przeworski and Sprague 1986; Cox 1997; Duverger 1954). However, the decisive condition that explains this development has been the parties' complex strategic game, which generates balance between the supply and demand of the system (Boix and Stokes 2007; Mainwaring and Scully 1996; Moulian 2009; Valenzuela 1995).

## Origin and Evolution of the Party System

A basic condition to the existence of a party system in the full sense of the term is that its functioning result from the decisions and the interaction of its components and not from "mechanical" effects, either due to sociocultural factors or of institutional conditions. The consolidation of a party system occurs when the system works, non-mechanically, based on its internal conditions rather than heteronomous factors. In this sense, the system develops when certain social divisions become fissures or cleavages for party competition in the mid term, in the context of game rules and institutions that establish a framework of opportunities and restrictions for competition. (Kitschelt 2007: 532).

The first critical conjuncture was based on a clerical-anticlerical axis that divided the elite between 1857 and 1861, sparking the "Big Bang" of the Chilean party system (Valenzuela 1995). This conflict generated the groundwork for the origin of the system, supplied with beliefs and ideological divisions that structured party competition and political game; although it was limited by the control exerted by the presidential power until 1874. The parties that emerged from this conflict were aligned in three positions, based on the relationship, spaces of autonomy, and control between the Church and the State. Among them are those in the clerical pole, such as the Conservative Party (1857); those positioned in the political center, such as the Liberal Party (1867) and the National Party (1857); and those in the anticlerical pole, like the Radicals (1861). Some relevant points to understanding the functioning of the system in this context were the existence of a cumulative vote under the presidential power from 1974 until 1891 and under the power of the party machines from 1891 to 1925; the proliferation of fraud and bribery practices in electoral mobilization; and finally, the fragmentation of liberals into several parties. This last division took place in the second half of the nineteenth century, resulting in two parties: the Doctrinaire Liberal and the Liberal Democratic. Likewise, the Conservatives fragmented upon the events of 1857 into the Conservative party and The National or Monttvarista party. This shows that the party system was not only shaped by social divisions but that these also molded the strategic decisions of its actors.

The second critical juncture was the emergence of the social issue between 1920 and 1932 as the main conflicting axis of Chilean politics (urban class fissure). New class parties at the left of the spectrum originated from this conflict, such as the Communist Party in 1912 and the Socialist Party in 1933. Likewise, the system shifted its ideological repertoires and means of competition towards the left, displacing the Radicals to the political center, acting as the middleman between both poles, while Conservatives and Liberals represented the right wing. The 1925 Constitution established new mechanisms that modified the functioning of the electoral and party systems, such as the direct election of the President of the Republic and Parliamentarians, the creation of an administrative body in charge of managing and controlling the electoral process (Electoral

Registry) and the implementation of a proportional plurinominal electoral formula (d'Hondt) for parliamentary elections. It is worth noting that during the time this cleavage organized partisan competition, the electorate expanded with the incorporation of women in municipal elections in 1934 and in the following presidential and parliamentary elections of 1949.

The third critical conjuncture that reorganized the Chilean party system was generated during 1952 and 1958, pushing a new shift to the left. At this juncture, the Christian Democratic Party and the Popular Action Front (FRAP) emerged simultaneously in 1957 as a coalition that brought together left-wing Marxist-oriented organizations between 1956 and 1969. One of the relevant events during this period was the triumph of Carlos Ibañez in the presidential elections of 1952 and in the parliamentary elections of the following year, which caused the reordering of the party system and the electoral fall of the right. The rural vote obtained by Ibañez and the Labor Agrarian Party crumbled the conservative hegemony over the peasant electorate. Likewise, the convergence of the Christian reform parties, the National Falange and the Social Christian Party which had garnered poor electoral results until then, became a complementary factor for the decline of the conservative vote in the years 1952 and 1953. The Christian Democratic Party emerged in 1957 resulting from the union of these groups. The increasing levels of polarization in competition in the following years were derived from international events like the Cuban Revolution in 1959 that strategically radicalized the left. They were also the result of reforms in the final years of Ibáñez's government, such as the lift of the ban on the Communist Party established during Gabriel González Videla's administration and the prohibition of subnational electoral pacts.

The transition from authoritarianism to democracy between 1988 and 1990, which divided Chilean society in supporters of Pinochet's Authoritarian Regime and its opponents, added an additional fissure to the aforementioned conflicting conjunctures. This cleavage lasted for 20 years during the Concertación governments supported by the effect of the binominal majority electoral system, which produced incentives for the subsistence of the two coalitions that led the transition and systematic ties at the parliamentary level, given the characteristics of the electoral formula and the district. The four Concertación governments, with Presidents Aylwin (1990–1993), Frei RT (1993–1999), Lagos (2000–2006), and Bachelet (2006–2010), progressively declined in support and in discipline as a coalition. As the cleavage of authoritarianism–anti-authoritarianism was losing strength, the conflict of organizing political competition was replaced by a debate over the overcoming of Pinochet's inherited model and the depth of its possible reforms (Garretón 2012; Siavelis 1999, 2004).

Following the right wing positioning in power with Sebastián Piñera's election in 2010, the authoritarianism/anti-authoritarian cleavage declined and new tensions emerged, reorienting competition and political conflict. A set of sectoral conflicts that have since multiplied after Piñera's first period in office generated opportunities for a second transition, aiming at overcoming the development model inherited from Pinochet's regime. The main conflict was the student movement for the reform of higher education under the slogan of "Free, public and quality education"; a collective action that prompted a rapid erosion of the right-wing administration and the return of Michelle Bachellet to office, addressing part of the demands of the movement in her program. The replacement of the Concertación by Nueva Mayoría as a supporting coalition for the second Bachelet period and the emergence of Frente Amplio as the left pole of the system, with new leadership from student organizations, were symptoms of the new displacement of the party system.

## Multiparty System, Participatory Division and Legislative Cohesion

The exceptional Chilean party system development is the result of a combination of multiparty and institutional stability in the context of the

Presidential System (Chasquetti 2001, 2008). During the twentieth century, multiparty elections occurred for most of the period, with three exceptions: Carlos Ibáñez del Campo's first turn (1927–1931); Gabriel González Videla's administration, and Carlos Ibáñez's second time in office, during which the Communist Party was banned by means of the Permanent Defense of Democracy Act (Law 8987, September 1948, known as "Ley Maldita" (Cursed Law)), and finally, during the Pinochet Authoritarian Regime between 1973 and 1988. In other words, two out of the three reactionary moments in the Chilean multiparty movement during the 1900–2017 period were authoritarian interruptions that caused a break in the democratic system (late 1920s and 1973–1988) and the other had a strong antiparty propensity in a context of extreme division and weakness of the party system (1950s) (Graph 1).

The electoral results between 1925 and 2017 at the legislative level indicate that there was a wide distribution of seats in the Chamber of Deputies among the competing parties in the electoral process in this extended period, except during the 1964–1966, with a strong predominance of the Christian Democracy (PDC) in the Lower Chamber for the 1996–1998 period under the predominance of the Independent Democratic Union (UDI) and the PDC; and during the 2004–2007 period, with predominance of UDI, PDC, and Party for Democracy (PPD).

In these three moments (1964–1966, 1996–1998, and 2004–2007), the party division decreased at the legislative level due to an increase in the representation of the PDC in one case and due to the effects of the majority binomial system in the other two cases. This shows that there was a high level of party splitting for the period despite Chile's strong presidentialism, the need to create alliances to enhance the government's management or the opposition's veto capacity.

Although the party system was characterized by a high degree of division during most of this period, the stability that followed challenges Duverger and Sartori's theory on the problems associated with extreme or polarized multiparty systems (Graph 2).

Another relevant trend during the 1900–2017 period was the growing legislative cohesion. During the first decades of the twentieth century, many members of Congress were elected as independent and party discipline was weak; but after 1990, most legislators began voting aligned with their respective parties. The trend suffers a

**Chile's Political Party System, Graph 1** Multiparty elections in Chile. (Source: Varieties of Democracy Version 8. Q. Was the national election multiparty? The cuts on the trend represent to the dictatorships of Ibáñez (1928–1930) and Pinochet (1973–1989). The graph considers statistical treatment of results)

**Chile's Political Party System, Graph 2** Party division in the Chilean Lower Chamber (1925–2017). (Source: Varieties of Democracy Version 8. To complete the data we used Rae's formula, 1971. $F = 1 - \sum_{i=1}^{n} P_i^2$. Where p is the percentage of votes or seats (calculated on 1) that each match gets. The result is indicated as either 0–1, where 0 indicates that a single party obtains the totality of votes or seats and 1 indicates that each competing party obtained the same number of votes or seats)

regression in two moments, between 2004 and 2011, due to the emergence of centrifugal forces within the Concertación, and following the reform of the electoral system in 2013 with the end of the Concertación, the birth of Nueva Mayoría and the emergence of Revolución Democrática (RD), Izquierda Autónoma (IA), EVOPOLI, among other new party organizations. These two moments, which are regressive from the legislative cohesion perspective, allowed for the transformation of competition methods, replacing contention between two great coalitions for a much more complex, multipolar and multidimensional competition based on opposing views on public policy issues (Graph 3).

At first glance, these tendencies towards a high partisan fractionation and the growing legislative cohesion seem contradictory evolutions; however, the gradual learning of the Chilean political class has allowed these processes to contribute to the development of a multiparty case of high institutionalization (Lomnitz and Melnick 1998). That is to say, a strongly institutionalized party system, in that it has stable rules of competition, parties have a strong roots in society, and parties have legitimacy as central actors in the democratic process (Mainwaring and Scully 1996; Boeninger 1997).

## Coalition Governments and Party System

The difficult combination of presidentialism and multiparty system has been described as a mix that endangers the stability of democracies. The Chilean case contradicts this belief given that it is a multiparty system with high institutional stability in the Latin American Region.

A longitudinal look at the relationship between parties and coalition governments explains the contingent conditions on which the exceptionality of this party system is built, starting in the 1930s. Until that moment, the Chilean party system did not reach autonomy either by the intervention of the presidential power until 1891 or by the intervention of Parliament, between 1891 and 1925.

Out of the 14 presidents elected in the period starting from the second government of Arturo

**Chile's Political Party System, Graph 3** Indicator of legislative cohesion. (Source: Varieties of Democracy Version 8. The graph considers statistical treatment of results)

Alessandri Palma (1932–1938) to the second government of Michelle Bachelet (2014–2018), only six presidents had the status of majority governments and eight have had minority support, the latter having being elected by agreement of Congress (until 1973) or by a second electoral round (starting 1990). In this long period, there was only one case of "monochromatic" government (of a single party) during the Christian Democrat administration of Eduardo Frei Montalva, in 1964. Minority governments have been predominant and therefore, the stability of the party system and the Chilean democracy is the result of precarious balances between presidential power and a generally self-regulated veto capacity on behalf of the divided parliamentary elite as a result of the multiparty system.

Chilean political history shows that the coalitional processes emerged as compensatory strategies to avoid undesired effects of minority presidencies or high parliamentary division in the system (Boeninger 1997; Chaisty et al. 2012; Cheibub 2002; Moulian 2009). From this perspective, the need for coalition was greater when the risk of vulnerability of a government increased. This, along with division, occurred when the percentage of parliamentary seats that belonged to the president's party decreased. As shown in the following graph, the need for coalitions as a means of support for presidents, estimated through the Coalition Necessity Index (INC), behaves inversely to the percentage of seats controlled by the President's party (Chaisty et al. 2012: 7) (Graph 4).

This way, the percentage of seats taken by the president's party helps estimate the required parliamentary support to ensure the legislative management capacity of a government and, in extreme cases, guarantee minimum conditions for its viability. Although during most of the period between 1937 and 1973 the support of the president's party bordered on 20% of the total seats in the Chamber of Deputies, a situation that confirms that the restrictions for the exertion of presidential power during these years, the INC increase in 1953 due to the increase in the effective number of parties (NEP) was resolved at this juncture through the authoritarian antiparty formula established by Carlos Ibáñez del Campo on his second term (1952–1958). The decrease in the percentage of seats controlled by the Socialist Party in 1969 (10% of the Chamber of Deputies) determined a set of complexities for president Salvador Allende (1969–1973) in terms of the

**Chile's Political Party System, Graph 4** Coalitional Need Index (INC) and seats of the president's party. (Source: Own elaboration from Siavelis (1999), Valenzuela (2003) and Gallagher and Mitchell (2008) for the 1925–1973 period and web with historical information on the Chilean Electoral Service from 1989 to 2009, available at: http://historico.servel.cl/)

management of his governing coalition (Unidad Popular) and for the maintenance of the relationship with the legislative power, with tragic consequences for the Chilean democratic system.

Naturally, the need for this support varies depending on multiple institutional or historical factors, even with the same number of seats controlled by the government, when it comes to approving a certain policy or stopping an accusation from legislators against the executive power. In general, since 1900 there has been a predominance of the multiparty system under the legislative control of the president's party, with two exceptions; the PDC government elected in 1964 and the two initial governments of the Concertación (Aylwin, in 1990 and Frei RT, in 1994). In all other cases there was a high dependence on the supporting coalition at the parliamentary level (Carey 2002).

However, throughout the political process of the last century, only three coalitional processes have allowed the formation of lasting government coalitions, albeit with different political results: the Frente Popular (1936–1941), the Unidad Popular (1969–1973), and the Concertación de Partidos por la Democracia (1989–2010). Subsequently, there have been two government coalitions with a capacity for sustenance and a certain level of self-regulation: Coalición por el Cambio during the first Sebastián Piñera's first term (2009–2013) and Nueva Mayoría during the second government of Michelle Bachelet (2013–2018).

Frente Popular (1936–1941) was an electoral and government coalition in Chile from May 1936 to February 1941, replicating the European frontier experience that brought broad center-left alliances to power (Angell 1974). This coalition was involved the Radical, Radical Socialist, Communist, Socialist, and Democratic parties, as well as other social organizations such as the Confederation of Chilean Workers (CTCH), the Student Federation of Chile (FECH), the Pro-Emancipation Movement of the Women of Chile (MEMCH), and the Frente Arauco Unico (Urzúa-Valenzuela 1984: 76 and 77).

From a programmatic point of view, the Frente Popular promoted a platform oriented to generating deep transformations, but at the same time, it was defined as a "moderate" alliance. The three axes that prioritized the Front's program were the defense of the democratic system, national

economic planning as an instrument to stimulate industrial production and educational reform with an emphasis on public education (Milos 2008).

The Unidad Popular (1969–1973) was an electoral and government coalition formed in October1969 by the Socialist and the Communist Parties, as well as various political and social actors committed to the construction of socialism through democratic means. During the presidential elections of 1970, this political-electoral coalition was formalized, replacing Frente de Acción Popular (FRAP), an alliance of left parties during the period of 1956–1969 (Alvarez 2010).

Other members of Unidad Popular (UP) since December 1969 were the Unitary Popular Action Movement (MAPU), Independent Popular Action (API), the Social Democratic Party, and since 1971, the Radical Left Party and the Christian Left. All these actors came together as a result of criticism of the Christian Democratic government of Eduardo Frei Montalva and, on a more general level, as a result of questioning of the developmental and import substitution industrialization strategies applied by previous governments since the late 1930s.

The strategic internal conflict of the UP, between supporters of the "institutional way" and supporters of the "insurrectional path," contributed to hardening the stances within the Coalition: the official stance represented by Allende and the Communist Party and the dissident one from MIR, MAPU, and the Socialist Party since 1972. During the entire UP government period, the "institutional path" was not dominant, which increased the difficulties for the functioning of the Coalition and limited the effectiveness of the presidential leadership. On the other hand, the persistence of the insurrectional strategy on top of the sum of the aforementioned factors contributed to multiplying the actors with veto capacity against the UP government.

The Concertación de Partidos por la Democracia (1989–2010) was a government coalition for four consecutive periods, from 1990 to 2010. Its origin can be traced to the organic transformations of the reformist opposition to the Pinochet Authoritarian Regime during the 1980s. The strategic division between a revolutionary opposition (represented by the Popular Democratic Movement, MDP), promoter of a political exit through insurgency and another opposition of the reformist type (represented by the Democratic Alliance, AD and then by the Concertación), which promoted the overcoming of authoritarianism through negotiations and transactions, defined the original model of the Concertación as a coalition with an adaptive propensity. (Mella 2008)

This political alliance was developed in two stages, namely, one that was electoral in character and another where the coalition maintained power in government. The first stage began in 1988 in the context of the organized Plebiscite to decide whether Pinochet would continue in power until 1997 or elections were to be held. This alliance, Concertación de Partidos por el NO, brought together a range of seventeen center-left parties and social organizations opposed to Pinochet (Mella 2011a, b). The second stage, from March 1990 to March 2010, included four subsequent coalition governments under presidents Patricio Aylwin (1990–1993), Eduardo Frei Ruiz-Tagle (1994–1999), Ricardo Lagos (2000–2005), and Michelle Bachelet (2006–2010).

## Conclusions

The Chilean system is characterized by a remarkable capacity of its actors to generate political development that is growing and sustained over time, based on a combination of theoretically unfavorable conditions, such as the combination of presidentialism with multipartism, the reiteration of minority governments, and the trend to party fractionation.

The political history of this country shows that, in compensation to these conditions, the actors of the party system promoted adaptations that transformed the restrictions into capacities, for example: political learnings that contributed to a

strong legislative discipline, formation of government coalitions to compensate the restrictions of minority presidencies, and the strategic use of the "presidential toolbox" aimed at maintaining governmental coalitions and enabling relevant public policies.

This strategic relationship between the government and the parliament also allowed the adaptation of the party system to the different divisions that affected Chilean society, stabilizing the matrix of parties in an exceptional way in the Latin American context. Exceptionally, the personalist or autocratic solution interrupted this development three times during the twentieth century (1927–1931, 1949–1957, 1973–1988), resolving these involutions with new balances among the actors that made possible a trajectory of institutionalization of the matrix of Chilean parties.

# Chile's Trade Policy Based on Export Promotion

Alfonso Dingemans
University of Santiago de Chile, Santiago, Chile

## Synonyms

Commercial policy

## Definition

Trade policy refers to any form of governmental intervention that affects the environment in which a country's international trade takes place. These interventions can be policy instruments, institutions, and/or agencies – behind, at, and beyond the border – in a uni-, bi-, pluri-, or multilateral setting. Microeconomic theory and specifically trade theory have had a large influence over how trade policy is understood and prescribed. Tariffs and trade liberalization are at the center of the scholarly and policy debate, although in practice trade policy encompasses nontariff measures such as export facilitation and promotion, and trade protection is historically more pervasive than standard microeconomic theory suggests, especially in lesser-developed regions such as Latin America.

## Standard Economic Approach on Export Promotion

Pro-market reforms of the 1980s and 1990s in Latin America implied a change from autarchic, inward-looking, developmentalist, if not statist, policies – as a whole better known as import-substituting industrialization (ISI) – toward trade liberalization within the broader framework of the Washington Consensus (Williamson 1990). According to this school of thought, exports are deemed essential to economic growth. Inspired by standard trade theory, free trade – i.e., the absence of any state intervention, specifically trade barriers – is supposed to create maximum benefits for an economy, following the comparative advantages resulting from the international division of labor. The international competition would push domestic companies toward efficiency or force them to close, thus giving markets the appropriate incentives for technological change. Both forces point in the direction of more efficiency and productivity, suggesting that export growth ultimately spawns economic (i.e., GDP) growth.

Trade policy – and specifically trade liberalization – was therefore put at the heart of Latin America's development policies (Edwards 1995), as the data in Figs. 1 and 2 show. This shift toward free trade marks a major shift in Latin American trade policy, traditionally rather protectionist, even in the heyday of liberalism in the nineteenth century (Coatsworth and Williamson 2004). Note that at a regional level export growth and GDP growth are highly correlated (with a Pearson correlation coefficient of 0.97), as standard economic theory suggests.

**Chile's Trade Policy Based on Export Promotion, Fig. 1** Latin American exports, 1989–2014. (Source: World Bank)

**Chile's Trade Policy Based on Export Promotion, Fig. 2** Latin American exports as a percentage of GDP, 1989–2014. (Source: World Bank)

Moreover, Latin American countries have indeed advanced, albeit sometimes haphazardly, toward trade liberalization since the 1990s and until at least the early 2000s (Lengyel and Ventura-Dias 2004), on a multilateral (in the context of the General Agreement on Tariffs and Trade – GATT – and since 1995 the World Trade Organization, WTO), plurilateral (e.g., initiatives like the North American Free Trade Agreement – NAFTA – and Mercosur), and bilateral level (especially free trade agreements proliferated since the stalling of the Doha Round).

Although the Washington Consensus experienced a backlash of sorts in the late 1990s, a process better known as the "left turn," which challenged virtually all Latin American neoliberal economic orthodoxy (Flores-Macias 2012), and although the so-called BRIC countries (Brazil, Russia, India, and China) amassed sufficient negotiating power to prevent mainly the

European Union and the United States from imposing tariff reductions for their manufactures in the rest of the world without liberalizing their own economies for foreign agriculture, the need for exports remained unscathed in this region. Initiatives like ALBA (*Alianza Bolivariana para los Pueblos de Nuestra América*), aimed at creating local alternatives to neoliberalism (or capitalism), still seek to expand access to international markets for their goods and services, but under more favorable conditions for poorer countries. Finally, even though China could be regarded by many Latin American countries as a direct threat for local manufactures (Gallagher and Porzecanski 2010), virtually all of them have signed FTAs with China. In sum, tariff reductions remain the basic principle of Latin American trade policy.

The available data sustains this view. The effective rate of protection has, on average, declined sharply since the 1990s (see Fig. 3). Additionally, Lora's (2012) updated Structural Reform Index for the 1985–2009 period shows that the regional average for the Trade Reform Subindex, which ranges from 0 to 1 (numbers closer to 1 indicate freer trade), increased significantly in the early 1990s, after which it plateaued around 0.87.

However, free trade should not – at least from a theoretical standpoint – be regarded as an end in itself. Contrary to the belief that "chips are chips" (Gilpin 2001), the quality of export growth matters (Agosín 2000). If export growth is not accompanied by an increase in added value, for instance, by means of export diversification, the chances to achieve long-term economic growth are limited. This challenges the common sense belief, introduced by Adam Smith's argument against mercantilism, that specialization – i.e., export *concentration* – through comparative advantages created by free trade and the unhampered international division of labor will create efficiency gains that will sustain long-term economic growth. If long-term economic growth depends on export *diversification*, it means that comparative advantages should be challenged to some extent. This raises the question when, how, and who should challenge them, spawning a host of political economy questions that reassess the role of the state in economic development (Amsden 2001; Chang 2002; Jacobs and Mazzucato 2016). An approach of *dynamic* comparative advantages appears as a middle way between market-led and state-led development (Lin and Chang 2009).

The question is, however, to what extent this debate has affected Latin American trade policy. On the one hand, trade-related reforms were characterized by tariff reductions, reduction of non-tariff barriers (red tape), reduction of tariff dispersion, and reduction or elimination of export taxes. In a broader sense, there was also an acknowledgment that macroeconomic policies would have to be "export friendly," although the

exchange rate has remained Latin America's Achilles' heel (Edwards 2010). In a sense, the focus of trade policy broadened somewhat. It was acknowledged that state intervention is not necessarily limited to tariff reductions or increases (at-the-border interventions), but entailed also behind-the-border (subsidies, industrial policies, macroeconomic policies, i.e., all activities that affect the competitiveness and added value of exports before reaching the border) and beyond-the-border interventions as well (transportation costs, country branding, sectorial branding, international marketing, i.e., all activities that affect the competitiveness and added value of exports once they crossed the border).

Nevertheless, in practice, as already mentioned, free trade agreements – i.e., negotiated, bilateral tariff reductions – remain the preferred instrument of their trade policies. On the other hand, Latin American governments have also implemented organizations that promote exports – which in some cases extend to investment promotion within the same organization, as can be seen in Table 1 – and move therefore beyond their traditional at-the-border role (i.e., tariffs and red tape). Additionally, export promotion agencies tend to have close ties to ministries (or departments), as can be seen in Table 2.

The foregoing suggests that the challenge is not so much explaining the tariff level, but rather mapping their varieties of trade liberalization. In spite of the usefulness of theoretical frameworks like Krugman's concept of strategic trade policy (Krugman 1986), endogenous tariff theory or virtually any other model developed by political scientist and (international) political economists (see for an extensive review McGillivray 2001; Mitra 2008), they tend to have a reductionist view of trade policies. By overemphasizing tariffs, they ignore the complexities and varieties of trade policies. Similarly, standard economic theory assesses the effects of trade policy in terms of the effect that tariffs have on economic growth

(Neary 2001), which is – once again – a reductionist view of both trade policy and its objectives.

The extent to which Latin American trade policies rely on market-led or state-led governance of the export sector is unclear. Given the fact that Chile is one of the first Latin American countries to have reformed its trade policy toward free trade (indeed, it is one of the few cases in history that implemented a unilateral tariff reduction) and is widely regarded as a role model because of the success of its export promotion agency ProChile, the latter question will be tackled on the basis of their experience.

## Chile's Export Promotion Strategy

ProChile is Latin America's oldest export promotion agency and is probably best known because of its prominent role in the successful introduction of Chilean wine (a nontraditional export) in the United Kingdom and in the promotion of Chile as a wine-exporting country (Agosín and Bravo-Ortega 2009). As such, it has been regarded as a blueprint for other Latin American export promotion agencies.

In 1973, a military dictatorship had seized power in the midst of a profound institutional crisis, triggered by the Marxist policies implemented by Salvador Allende's administration that basically curtailed private ownership. This radicalization of economic policies, in turn, could be regarded as the final, desperate stage of Chile's failed industrialization (Pinto Santa Cruz 1959). Although the economic direction that the military Junta would follow wasn't clear from the start, a group of Chicago-trained economists would occupy key positions in government, and they would use this position to implement sweeping neoliberal reforms (Fontaine Aldunate 1988). In terms of Chile's trade policy, in 1975 unilateral tariff reforms were implemented, which caused that many Chilean firms and even complete industries disappeared (Meller 1996). International competition had weeded out the inefficient companies and those that could not keep up with technological change. The institutions created during this period still determine Chile's export performance. Their

impact – and their success – probably explains why a renowned Chilean economist concluded in 2001 that no more institutional reforms were needed in Chile's trade sector (Hachette 2001).

ProChile was founded in 1974, just before Chile's economic trade liberalization. This could be regarded as a remnant of economic nationalism, traditionally popular within Latin American military doctrine, before the neoliberal reforms of the Chicago Boys. On the other hand, within in the context of pro-market reforms and especially one that relies heavily on exports, it makes sense to centralize efforts in order to increase exports. Note that fostering exports does not necessarily entail state-led promotion or a full-fledged defiance of comparative advantages and can be limited to supplying public goods (for instance, market research and other economic information). This would respond to a standard, neoclassical approach to certain market failures, according to which state interventions should restore the price mechanism and not alter its "optimal" allocation efficiency. Essentially, it does not defy an economy's comparative advantage (which dynamics are still market led). A different approach would be "picking winners" and reallocate resources in such a way that specific (nontraditional) sectors are being favored. Comparative advantages are, under this perspective, most likely to be defied (which dynamics can be state led). Complexities and singularities aside, the former describes best the Latin American (and Chilean) case and the latter the East Asian case. For the sake of argument, we will define the former as export facilitation and the latter as export promotion.

Of course, the predominance of one type does not preclude instances of the other. In the particular case of Chile, two examples come to mind. The first is the forestry industry, which has been promoted by different governments since the 1960s. Even the military dictatorship issued an Executive Order No. 701 that would subsidize reforestation, a "horizontal" policy that clearly contradicts the expected neutrality of government policies. The second is the salmon industry, another nontraditional export, which was promoted by Fundación Chile, a public-private partnership, in the early 1990s. Although both industries are not a full-fledged defiance of Chile's comparative advantage (both are natural resources without much added value), the policies used to promote them are more an example of state-led than of market-led policies.

ProChile, however, fits better in the category of export facilitation than of export promotion, even though it is concentrated on behind-the-border activities. Specifically, it was founded to help Chilean companies to internationalize their activities. Later on, the objectives of increasing and diversifying nontraditional exports were added. Contrary to the belief that institutional reforms are no longer needed in Chile, ProChile has known five different organization charts in the last 5 years. Nevertheless, its activities have consolidated around three main strands: (1) diffusion, (2) training, and (3) promotion and consolidation.

Among the first, ProChile provides (prospective) exporters with trade information and market surveys. The organization also coaches individuals and organizes workshops to explain to firms how to export. In the same fashion, it also provides them with pre-internationalization missions. Finally, the third strand is ProChile's most important one (almost 80% of its budget is dedicated to these activities, as opposed to 13% and 7% of the other two). This includes the organization of international fairs abroad and presidential tours – the best known are *Sabores de Chile* (Flavors of Chile) and the Chilean Wine Tour. It also provides a meeting space with others exporters, and it supports communication and marketing campaigns (to increase and diversify the export mix) of which the strengthening of "sectoral brands" (like Chile: Potencia Alimentaria, *Chile: Food Power*) and Chile's country branding (together with the public-private partnership called Fundación Imagen de Chile) are the most important ones. Probably the largest item of ProChile's budget goes to competitive funds (sectorial brands are

**Chile's Trade Policy Based on Export Promotion, Table 3** ProChile's annual budget

| 2013 | 33,941,405 |
| 2014 | 34,051,409 |
| 2015 | 34,616,336 |

Source: Budget Office (2015)

funded like this). Private companies can apply to state co-funding of a myriad of activities, provided that their objectives coincide with ProChile's. The key to this fund's success is the shared financial burden: in order to weed out projects with questionable returns, private actors are supposed to disburse 20% of the project's total budget. Finally, ProChile provides exporters with tools and know-how regarding customer management (Table 3).

All these activities – including the contestable funds – can be summarized as the provision of public goods, specifically aimed at improving the quality and quantity of information at the disposal of both exporters and foreign consumers (Volpe Martincus 2010). These activities do not quite challenge the comparative advantage of Chile's economy. They rather help to identify them more accurately.

ProChile's most recent reforms – under the Piñera administration – aimed at forging a closer relationship with incipient innovation policies. Unfortunately, no precise policy or objective has been defined – beyond this mission statement, that is – and it's not clear whether ProChile is now expected to embark on coordinating industrial policies, for instance. What is clear, however, is that ProChile is now active in all three stages of export: behind, at and beyond the border.

In terms of its target "customers," ProChile is increasingly expected to support small and medium enterprises (SME), which underlines its market-complementing character. Its activities are not supposed to alter relative prices, thereby altering resource allocation, but rather overcome traditional market failures through the provision of specific public goods and services. The latter can be observed in many instances of ProChile's behavior.

First, according to ProChile, Chile's major asset – in terms of trade liberalization – is its complete and complex (rivaled by no other country in the world) network of FTAs. Diversification has not happened because Chilean companies have barely tapped into the enormous potential that they offer. Consequently, it is believed that tariff reductions will spawn a change in Chile's production structure.

Secondly, although ProChile embarks on behind- and beyond-the-border activities, they are highly standardized with hardly any impact assessment. In spite of the importance of the Japanese and Chinese market for Chile, no special services are provided to respond to the peculiarities and singularities of the Asian consumers and businessmen. The objective is to provide them with information, not to design strategies that could violate the principle of policy neutrality. This would explain, too, why the awarded subsidies from ProChile's competitive fund are not evaluated in terms of impact or coherence with other winning projects. It is merely a demand-side subsidy, not a reflection of state priorities as in the East Asian case. This lack of strategic vision – for whatever reason – is best seen with Chile's country branding campaign. Probably a low-point was the slogan – a pun that fell flat – *Chile: All Ways Surprising* (Felzensztein 2008).

## Conclusion

Trade policy in Latin America has moved toward free trade. Although the "left turn" posed a challenge to neoliberal economic orthodoxy, the critical role that exports play in modern economies has remained unquestioned. At the same time, trade policy moved from at-the-border activities to include also behind- and beyond-the-border activities, without affecting the centrality of tariff changes (FTAs are still the preferred policy

instrument). Hence, Latin American trade policies – in spite of searching a more diversified export mix, with higher added value – still hinge on the idea that export growth implies to a large extent long-run economic growth. The potential that more active trade policies offer – defined here as export promotion – have been nevertheless largely ignored, as the case study of Chile suggests. ProChile, in spite of all its notable successes, views its role more as a facilitator that contributes to improving the information at the disposal of consumers and traders, than as a guide that articulates a trade strategy to challenge coherently the economy's comparative advantages.

## Introduction

Between 1990 and 2013, there were more than 25 attempts in the Chilean legislature to put an end to the electoral system regulating the election of parliamentarians that had been established by Pinochet's authoritarian regime. Known as the binomial system, it had been criticized on various grounds (Chasquetti 2017). On the one hand, its legitimacy was questioned: because it was established by Pinochet, it was considered to be an "authoritarian legacy" (Garretón 2006). On the other hand, critics argued that the distribution of electoral districts led to pronounced inequalities in the vote (malapportionment), that it generated a marked disproportionality in representation, that it excluded important groups from the assembly, and that it did not encourage interparty competition (Auth 2006). Public opinion polls showed that a large part of the population supported electoral reform (Segovia and Laroze 2009). Nevertheless, no reform attempt prospered.

Following the 2013 elections, the political and parliamentary scenario changed significantly. This encouraged the government of Michelle Bachelet (2014–2018) to make a further attempt at reform of the electoral system. Thus, at the beginning of her administration, she presented a reform bill whose main objectives were to reduce the levels of malapportionment, promote greater interparty competition, increase the representativeness of the system by establishing greater opportunities for other groups to reach Congress (Gamboa and Morales 2016), and change "the current unequal gender representation in the National Congress" (Bachelet 2014). After a year of debate and negotiation, in 2015 a large enough parliamentary majority was finally assembled to replace the binomial system with a (so-called) moderate proportional system. The new rules were applied for the first time in the 2017 elections.

This contribution describes and examines the main components of the new Chilean electoral system and analyzes the results of the first elections held under these new rules. The first section describes the main features of the electoral system for parliamentary elections in Chile and explains, with an illustrative example, how the seat distribution system works. The second section analyzes the effects of the electoral system using data from the 2017 election. We refer to the system's results in terms of proportionality, fragmentation, and the effect of the quota law. We conclude with some final observations.

## The Electoral Rules for Parliamentary Elections

Conceptualized in its simplest form, an electoral system is the mechanism by which votes are converted into seats (Herron et al. 2018: 2). A fuller definition adds three other elements: rules on the distribution of districts, the form of candidacies, and voting rules (Nohlen 1995). Considering these four elements, the new Chilean electoral system is characterized by (a) division of the territory into plurinominal districts of variable magnitude (M), (b) open lists, (c) a secret ballot and a single ballot paper, and (d) use of the D'Hondt rule as a mechanism for seat allocation.

The Chilean parliament consists of two chambers, the Senate and the Chamber of Deputies (CD). Under the binomial system, the Senate was composed of 38 senators and the CD of 120 deputies. This system established that two parliamentarians ($M = 2$) were to be elected for each electoral district both for the Senate and the CD, so there were 19 senatorial constituencies for the Senate and 60 electoral districts for the CD. The parties could compete alone or as part of apparentments formed with other parties. Each party or apparentment could present up to two candidates for each electoral territory. Voters had

to vote for a single candidate only, never for a list. Seats were distributed according to the D'Hondt rule. Thus, to determine which candidates were elected, the first point considered was the sum of the votes obtained by the candidates on a list. If a list obtained more than twice as many votes as the runner-up list, both its candidates won seats. Failing this, seats went to the two candidates who had the most votes of the two lists with the most votes (Gamboa and Morales 2016).

The new system is different. First, the number of seats to be elected increased for both chambers: from 120 to 155 for the CD and from 38 to 50 for the Senate. At the same time, in the case of the CD, the number of districts was reduced from 60 to 28, while their magnitude varied between 3 and 8 (5.5, on average). The new districts were created mainly from mergers of pre-existing districts. Moreover, a new rule was introduced for the CD: every 10 years the electoral authority (SERVEL) must recalculate the number of seats corresponding to each district according to variations of its population, but the number must never be less than three or greater than eight in any district. Deputies' term in office is 4 years, so that in each election, the CD is renewed in its entirety (Gamboa and Morales 2016).

Meanwhile, the number of senatorial districts was reduced from 19 to 15. Again, these were based on the pre-existing districts. The M is also variable but only between 2 and 5. Consequently, the binomial system was essentially left unchanged for five senatorial districts (Gamboa and Morales 2016). Senators' term in office lasts for 8 years, so that the Senate is partially renewed every 4 years (depending on whether the senatorial districts are even or odd).

As a result of these changes, malapportionment was reduced. Indeed, at CD level malapportionment fell considerably, from a ratio of 17.8% to 10.6% (using the Loosemore and Hanby index). However, at Senate level, the result was negative: malapportionment increased from 30.7% under the previous system to 32.6% in the new one (Gamboa and Morales 2016).

Second, parties can compete by themselves and form a list on their own or join an apparentment. These are permitted at the national level, but sub-apparentments are not. In this way, parties can join forces by combining their votes to gain more seats. As a consequence, as explained below, the seat distribution system is carried out in two steps. In the first, according to the D'Hondt rule, the seats corresponding to each list are calculated. In a second step, following the same rule, the seats won by an apparentment are distributed to each of its component parties (Gamboa and Morales 2018a).

Also, the law established that, whether of a party or an apparentment, each list may propose one extra candidate in addition to the number of seats up for election in each district (the "M + 1" rule). It imposes no obligation on parties or apparentments in their choice of candidates. The only substantive limitation, in the case of candidates being chosen in state-regulated primaries, is that only up to 40% of a party's candidates may be chosen by this method, given the quota system (see below).

Third, for the first time in Chile, party lists are subject to gender quotas: no party may present candidates of either sex in excess of 60% of its total number of candidates. In addition, to boost women's participation, state reimbursements to women for votes obtained were increased, surpassing by 20% those received by men. Finally, a benefit for parties was established: for each woman elected, their party would receive a bonus of about US $20,000. Since these rules apply only to four elections (2017, 2021, 2025, and 2029), they are transitional. In short, this is a system of candidacy quotas and does not establish any priority for female candidates in the distribution of seats. In this way, the Chilean formula is one of "aspirant quotas" and not of "reserved seats" that guarantees a certain number of seats for women (Dahlerup 2007).

Lastly, as before, the lists are open, with voters having to mark a preference for one of the candidates. There is no list vote. The vote is voluntary.

The rules for seat distribution work as follows: first, the total number of votes obtained by each list (the sum of the votes obtained by each of its candidates) is calculated. Then, how many seats each list gets is determined according to the D'Hondt rule. The following example explains

the procedure: consider the case of a district that elects five seats (M = 5), and four competing lists each obtain the following number of votes: List A, 45,000; List B, 8000; List C, 27,000; and List D, 20,000. Applying the D'Hondt rule to this distribution, List A gets three seats, Lists C and D get one each, and List B gets nothing.

Second, once the number of seats corresponding to each list has been decided, which candidates get the seats can be determined. There are two possibilities. The first applies to a list composed of a single party, in which case seats are distributed according to the number of votes obtained by each candidate. In our example, if List C is composed of a single party, the candidate with the most votes is elected. The second possibility involves a list composed of several parties and includes candidates from different parties. Returning to the above example, let us suppose that List A (which obtained three seats) was composed of candidates from three parties. In this case, to distribute the seats between the parties, a calculation similar to the one described above is made, but this time considering that the number of positions to be distributed is three, and that there are three lists (corresponding to each of the three parties). Thus, the first step is to add the votes of the candidates of each of the parties. Supposing the result is Party A, 22,500; Party B, 10,800; and Party C, 11,700. Applying the D'Hondt rule again, Party A ends up with two seats and Party C with one. Party B gets nothing. So defined, the seats go to the candidates in each list with the most votes. Thus, in the example given, the two candidates of Party A with the most votes and the candidate of Party C with the most votes are elected. Thus, as in many PR systems, the candidates of each list with the most votes are not necessarily elected.

## The New Rules in Operation: Proportionality, Fragmentation, and Quotas

Electoral systems have effects on different characteristics of the party system, such as parties' level of fragmentation, the proportionality of representation, or indirectly on the polarization of the political system (Cox 1990; Lijphart 1994). In this section we analyze the results of the first elections in which this new open list proportional system was used, comparing its results with those of the previous electoral system. We focus, in particular, on three main issues: (dis)proportionality of representation, fragmentation of the party system, and the result of the gender quota rules. We concentrate on the results of the election of deputies, since it is the only one at the national level in which all the seats were up for election, as the Senate was only partially renewed, and therefore data for that election are limited. We also acknowledge that no definitive conclusions can be drawn about the effects of the new rules from the results of a single election. Yet they do allow trends to be identified, such as those we highlight below.

For the 2017 election of deputies, the 25 competing parties formed a total of nine lists. Of these, individual parties made up two, and apparentments made up the remainder. There were also 11 independent candidates. Each apparentment included between two and five parties. Of a maximum of 183 candidates that each list could include, more than 160 candidates were presented by three apparentments alone: the Frente Amplio, Fuerza de Mayoría, and Chile Vamos (Gamboa and Morales 2018a).

### Disproportionality

The first aspect to consider is the effect of the new rules on the proportionality of representation, understood as the difference between each coalition or party's percentage of seats and its percentage of votes. A positive difference indicates that the party in question has a "favorable disproportion," while a negative one indicates that a party has an "unfavorable disproportion" (Gamboa and Morales 2018a). As we pointed out above, a main criticism of the binomial system was that it generated very disproportionate results, favoring some parties while prejudicing others (Gamboa and Morales 2016). Therefore, according to the reform bill's backers, one of its objectives was to address and solve this problem.

Here we show the data on disproportionality from two perspectives. On the one hand, we

present the data at a general level, comparing them with data from the binomial system period. According to Gamboa and Morales (2018a), whether the Loosmore and Hanby index or the Gallagher index is used, disproportionality was variable between 1989 and 2013. According to the former index, and considering the results by coalition, disproportionality reached its lowest point in the 2001 elections, in which it scored 7 points, while its highest point was in 2013 with 12.2 points. If we use the Gallagher index, the lowest and highest points are found in these same years, with disproportionality figures of 5.2 and 7.8 points, respectively (in both indices, higher figures indicate less correspondence between votes and seats). Second, if we compare the figures for 2013 and 2017, the new electoral system can be seen to have not reduced disproportionality significantly. According to Loosmore and Hanby's index, it dropped only to 12.1 in 2017, while if we use Gallagher's, it fell only to 7.3. Third, if we apply the same exercise to individual parties, we see a similar phenomenon occurring: according to the Gallagher index, disproportionality reached 6.2 points in 2013 and 6 in 2017. In principle, then, the reform did not produce a substantial reduction of disproportionality in party representation.

On the other hand, it is interesting to observe what happens within apparentments, i.e., to examine who wins and who loses within the electoral alliances. Considering the three largest apparentments (which together obtained 87% of the seats in 2017), the evidence points to two main facts. First, within each of them, the largest parties were the most favored, each obtaining a favorable disproportion. For example, within the Chile Vamos apparentment, the party with the most votes (Renovación Nacional) notched up 5 points of favorable disproportion. In the Fuerza de Mayoría coalition, the result was similar: the party with the most votes, the Socialist Party, had a favorable disproportion of 2.5 points (Gamboa and Morales 2018a). Yet the other parties' distribution of seats was not proportional to their electoral weight either. Thus, for example, in the Fuerza de Mayoría pact, parties of different electoral weight obtained the same number of seats (Gamboa and Morales 2018a). This is a relevant point, insofar as it warns of how a particular feature of the system can affect the distribution of seats in a PR system.

### Fragmentation

A second important aspect is how many parties the political system is divided into. Given that the system changed from one of M = 2 for all districts to a higher and variable magnitude, barriers to entry to parliament were reduced, especially to the Chamber of Deputies (where the average M is higher). Thus, by lowering that barrier, an increase in the number of parties represented in parliament is to be expected. In the case of the 2013 elections, eight parties won parliamentary representation, while in 2017 15 did so. Between one election and another, in other words, the number of parties in parliament practically doubled. Undoubtedly, at first sight, the effect of the reform was to facilitate the entry of new parties. However, in political science there is consensus that measuring the fragmentation of the party system based only on how many parties are represented in parliament can lead to wrong conclusions, since not all parties have the same *weight*. In this way, to better understand the point, we need to consider other types of measurement, such as one that measures the number of effective parties (NEP) (Laakso and Taagepera 1979). In simple terms, this index of party fragmentation quantifies the significant parties that comprise a system. In the case of Chile, on average, the number of effective parties between 1989 and 2013 was 7.17. The highest figure for the period was in 2013, when the number of effective parties was 8.7. In 2017, under the new system, the NEP rose to 10.7, the top score since the return to democracy. Yet it should be noted that this metric had shown an upward trend before the electoral reform, particularly in the elections of 2009 (7.3) and 2013 (8.7). Thus, the increase in the NEP in the new elections is not necessarily dramatic. However, it is relevant that in 2017, there was a significant decrease in the combined electoral weight of the two traditional coalitions, the Alianza por Chile (which groups together the right-wing parties) and the Nueva Mayoría

(center-left, the successor of the Concertación). While in 2013 they accumulated 84% of the votes, in 2017 their combined votes dropped to 73.5%. In large part, this is explained by the emergence of a new left-wing coalition, the Frente Amplio, and the success of other small parties in gaining access to parliament.

### Gender Quotas

As explained above, for the first time in its history, Chile incorporated a gender quota system in its electoral rules. This is an "aspirants' quota" that does not ensure the election of women. Additionally, financial incentives were introduced to encourage women's participation in party lists.

What do the data tell us about the effects of the reform in this first election? First, that the number of female candidates obviously increased considerably. In the case of the elections for the CD, there was an increase from 19.4% in 2013 to 41.4% in 2017. Second, that the percentage of women elected to the Chamber of Deputies also increased: while in the 2013 elections 15.8% of the seats were occupied by women, in 2017 the percentage increased to 22.6%. Third, despite the above, it was also the case that there was no rise in women's rate of electability. Indeed, while in 2013 21.5% of the candidates won a seat, in 2017 this figure fell to 8.9%. Men's electability rate, on the other hand, remained intact. Finally, and unlike what happened before when the average votes of male and female candidates were much alike, in 2017 the average votes for female candidates fell to 1.9%, while that for men was 3.5%. What is the reason for this? The available evidence does not allow a definite answer. However, preliminary data show that female candidates (especially challengers) face greater difficulties than men in collecting campaign resources and therefore tend to be disadvantaged in elections (Gamboa and Morales 2018b).

## Final Remarks

Electoral systems play a fundamental role in the functioning of democratic systems by establishing the playing field for party competition. In this context, study of the Chilean case is particularly interesting since it analyzes the characteristics and (preliminary) effects of a recent electoral reform. On the first point, institutional design, we showed how the 2015 reform substantially changed the conditions of political competition in relation to those under the previous binomial system. As noted, the reform sought to achieve certain central objectives: to reduce malapportionment (by redrawing electoral district boundaries), to lower the entry barriers to the legislature (by increasing the average magnitude), to favor greater proportionality in the representation of parties, and to reduce inequity in women' access to the legislature. On the issue of proportionality, the literature suggests that greater proportionality would be achieved with a moderate increase in district magnitude (between three and eight for the CD and between two and five for the Senate). In turn, this increase would not have a very profound effect on fragmentation (Carey and Hix 2011). Finally, the D'Hondt rule was maintained as a mechanism for distributing seats, and the formation of electoral apparentments between parties is permitted (but sub-apparentments are not).

The results of a single election are insufficient to draw conclusions about whether or not the new electoral system achieved its proposed objectives. Given that the operation of the binomial electoral system that preceded the new formula for more than two decades served as the "driving force in party system change" (Scully 2017, 23), it is unrealistic to assume that the parties will adjust their expectations and strategies mechanically and automatically to the new rules. However, some trends can be observed. First, malapportionment was indeed significantly reduced in the districts to elect deputies, but not in the Senate. Second, the proportionality of representation was not substantially increased when the results disaggregated by party are considered. Third, in terms of fragmentation, there is an increase, although not a dramatic one, in the actual number of parties with parliamentary representation. However, it is difficult to attribute this effect exclusively to the electoral change, since trends suggesting increasing fragmentation of the party system were already observed before the reform. Finally, with regard to

equity in women's access to the legislature, the results of the 2017 elections are double-edged: on the one hand, an increase in the percentage of women candidates and women elected, but on the other, a substantial reduction in their electability.

## Synonyms

Policy advice; Recommendations

## Definition

Trade policy is a set of rules and regulations intended to change trade between countries.

Development policy refers to activities that aim to reduce poverty and inequality and to promote economic growth and sustainable development.

Foreign policy is a policy pursued by a state in view of promoting national objectives.

## Introduction

China's increasingly visible presence in the Caribbean will have a significant impact on governance in the region. First, Caribbean states will need to provide appropriate public policy responses to the serious challenges represented by Chinese

industrial competition and huge bilateral trade deficit. This might involve major efforts from national public administrations. Second, an important political factor is also at work that relates to the China-Taiwan competition for diplomatic recognition. This influences the development policies of Caribbean states that benefit from development aid provided by the two countries. Third, China is sometimes perceived – and welcomed – as balancing the US influence in the Caribbean. However, the prospect of increased Chinese-American rivalry will affect the economic and geopolitical situation of the region. It might compel Caribbean states to adapt their policies to a less stable, possibly bipolar regional environment.

## China's Relations with the Caribbean

Chinese migrants first arrived in the Caribbean more than two centuries ago. However, except for Cuba, it was only in 1972 – after the People's Republic of China was admitted into the United Nations – that Caribbean states began to establish diplomatic relations with the communist government in Beijing. Initially, exchanges were very limited, but a fundamental change became visible after 2003. During the following decade, Chinese exports to the region increased almost ten times, reaching $4.21 billion in 2013 (Campbell 2014). These exports are mainly finished manufactured products that have substituted more expensive goods from traditional trading partners, especially the United States. For their part, China's top ten imports from CARICOM are represented by raw materials. Different from the case of Latin America, there are no significant Caribbean agricultural exports to China (Montoute 2013: 117; Bernal 2015: 1409). The comparison with the neighboring region is useful in that it exposes a potentially serious consequence of China's economic presence. Indeed, while Latin American exporters of raw materials and agricultural products have greatly benefited from their access to the huge Chinese market, the massive growth of Latin American imports from China has had a deeply disruptive effect on local economies. Because Chinese laborers are satisfied with wages four times smaller than Latin American ones and accept worse working conditions, China has become a major threat to Latin American fashion products, low technology goods, and engineering and electronics products. Chinese textiles and footwear, for example, are three or four times cheaper than Latin American ones. Consequently, labor-intensive manufactured goods from Latin America were largely removed from a number of export markets while facing harsh competition domestically. This is a large-scale phenomenon that undermines the progress made by Latin America toward industrialization as it increases the dependency on raw materials exports and might even lead to the return to plantation economics (Paladini 2011: 83–84). Until now, the Caribbean did not experience a similar phenomenon mainly because of its limited production of labor-intensive manufactured goods. Yet, China does pose a threat to Caribbean manufacturing in fields that include textile, apparel, processed food, furniture, paper, and plastic products. Even the production of Trinidad Carnival costumes might be outsourced to China. Therefore, there is a serious risk that Chinese competition brings much of the industrialization efforts in the Caribbean to an end. Another critical issue is that of the bilateral trade deficit. The increase of Caribbean exports to China has been very modest. Moreover, between 2006 and 2009 their value decreased. This resulted in an annual trade deficit of more than $4 billion that is unsustainable in the long term (Bernal 2015: 1416; Montoute 2013: 121). In order to address this issue, policy recommendations are frequently formulated that include an increase in raw materials and agricultural exports to China, the development of Chinese tourism in the region, increased Chinese direct foreign investment, and turning the Caribbean into an entry point for Chinese products to the US, Canada, and the European Union (Montoute 2013: 113; Bernal 2014). However, in order to turn these recommendations into reality, major

public policy programs and actions are required that for the time being do not seem to represent priorities for most Caribbean governments.

In comparative terms, it is interesting to note that at present Caribbean imports from the USA and the EU are not decreasing. Rather, the dynamics of imports from China is part of an increase in overall imports (Montoute 2013: 119). The USA remains the most important trading partner of the Caribbean while China is not among the region's top three trading partners (Bernal 2015: 1419, 1431). At least in part, this is due to the fact that Caribbean trade is a matter of secondary importance for Beijing. The latter's interest in the region has mainly political reasons. One of them is the willingness to assert its great power status through global economic and political presence. Yet, by far the most important Chinese goal in the Caribbean is related to the constant effort to deprive the rival Republic of China – i.e., Taiwan – of international recognition and ensuing legitimacy. Out of the 22 states that recognize Taiwan, five are located in the Caribbean (Dominican Republic, Haiti, St Kitts and Nevis, St Lucia, and St Vincent and the Grenadines) and six (including Belize) in neighboring Central America. In fact, this is the only region in the world with more Taiwanese than Chinese embassies (Haro Navejas 2013: 148). This has turned the Caribbean into the arena of a confrontation that mainly takes the form of "checkbook diplomacy." Economic incentives are used by Beijing and Taipei in order to secure diplomatic recognition. Understandably, both countries maintain secrecy with respect to the amounts involved. Yet, it is estimated that the diplomatic competition is served by the bulk of their respective overseas aid, which before the 2008 "diplomatic truce" (see below) amounted to $1.5–2 billion annually in the case of China and to $4–500 million in that of Taiwan. This makes them significant donors for particular Caribbean countries (Atkinson 2010: 411). For their part, opportunistic governments in the region exploit the situation by shifting allegiance in exchange for increased financial support. Terms such as "swing states" or "flip-flop allegiance" were coined to describe the sudden foreign policy change of Belize, Dominica, Grenada, Nicaragua, and (twice) St Lucia (Paladini 2011: 73). For example, in 2004 the Commonwealth of Dominica asked Taipei for a $58 million aid. When the Taiwanese responded negatively, it recognized Beijing, as the Chinese had promised $100 million over 6 years with $11 million to be disbursed immediately (Li 2005: 88). St Lucia recognized Taipei in 1984 but switched to Beijing in 1997. Chinese aid included $15 million for a cricket stadium and $10 million for a mental hospital. However, in 2007 St Lucia switched back to Taipei, which promised to develop the agriculture and livestock sector, to boost tourism and to create information technology learning centres (Hu 2015: 18). Obviously, this competition is expensive for both China and Taiwan and in 2008 they took advantage of the election of a Beijing-friendly Taiwanese President, Ma Ying-jeou, in order to declare a "diplomatic truce" based on the preservation of the diplomatic status quo. Yet, the election in 2016 of a new Taiwanese President, Tsai Ing-wen, less favorable to China led to the renewal of "checkbook diplomacy."

China's widely noted 2008 *Policy Paper on Latin America and the Caribbean* elegantly translated this cynical financial-diplomatic game into the promotion of a "win-win strategy" (The State Council 2008). Its instruments include, at a regional level, the China-Caribbean Economic and Trade Cooperation Forum and the China-Caribbean Joint Business Council as well as China's membership in the Caribbean Development Bank and the Inter-American Development Bank (Bernal 2015: 1412; Haro Navejas 2013: 147; Montoute 2013: 112). Bilaterally, there have been high-level visits and political and diplomatic linkages at central and local government, parliament, and political parties level. Despite these contacts, Chinese foreign direct investment in the Caribbean remains very modest at $31 million in 2012, i.e., 0.05% of China's global foreign investment. The tax heavens of

British Virgin Islands and Cayman Islands represent an important exception as they received no less than $62.1 billion in 2012 alone. This money, however, was reinvested in China (Campbell 2014: 4–5). Still, there has been a substantial increase in Chinese development assistance to countries that recognize the People's Republic of China (Bernal 2015: 1431). While similar assistance from traditional partners such as the US, Canada, the UK, and the European Union (EU) tends to decline, development finance has been abundantly provided by Beijing. Reliable statistics are not available, but the assistance normally takes the form of market-rate loans for large infrastructure projects from two Chinese state-owned banks, China Export–import Bank and China Development Bank (Campbell 2014). On the negative side, China insists on using Chinese firms and workers on such construction projects, which has created significant frustration in the Caribbean as locals felt they were deprived of employment. Lack of technology transfer also has been criticized (Montoute 2013: 122).

Despite such criticism, Caribbean states that recognize the People's Republic of China appreciate the contribution of its assistance to the improvement of their social-economic situation. The lack of any conditionality – other than severing relations with Taiwan and accepting Chinese firms and workers – is also hailed, even if this involves a certain degree of ambiguity when US- or EU-promoted democracy, human rights, and good governance are taken into consideration. For their part, Caribbean states that prefer to recognize Taiwan maintain normal trade relations with China. Moreover, they are fully aware of the fact that Taiwanese generosity would instantly vanish if Beijing suddenly lost interest in the region and/or put an end to "checkbook diplomacy." Indirectly, they also depend on China's regional involvement.

To summarize, the development policies of Caribbean states have adapted to and are significantly enhanced by the valuable assistance received from the two Asian countries. However, at one point Taiwan's 23 million citizens might become unable to compete with China's 1.3 billion and decide to improve the bilateral relationship. If and when that happens, the "checkbook diplomacy" will obviously disappear and this will severely damage development policies in the Caribbean.

Outside the Beijing-Taipei rivalry, the Chinese economic and diplomatic presence in the Caribbean is expected to lead to renewed US, EU, and post-Brexit UK interest in the region, hopefully bringing an increase in their development assistance. At a more general level, the perception exists of China as a voice for the Global South. Its long term goals of bringing about a multipolar world and of transforming the global economic order are favorably perceived in the Caribbean as a way to diminish US political and economic dominance of the region (Montoute 2013: 112, 122–123). Yet, it should be noted that the Caribbean initial opening to China in the early 1970s only took place after the normalisation of Sino-American relations (Hu 2015: 22). Ever since, China's approach in the region has been "clearly low-key, careful not to provoke any hostile US reaction." It also has greatly benefitted from Washington's disengagement from Latin America and the Caribbean after 9/11 (Paladini 2011: 78, 80). Overall, Beijing's progressive involvement in the Caribbean can be described as an American-friendly exercise in soft power. In recent years, however, China's assertiveness under President Xi Jinping suggests a move toward challenging more overtly the US. President Trump's policies also might amplify mutual mistrust. If this trend continues, it will lead to increased Chinese-American antagonism that most likely will result in a potentially destabilizing struggle for influence in the Caribbean. Consequences are difficult to forecast, but it is clear that a Cold War-type international and regional environment will have a deep and long-lasting impact on the public policies and on the general political and economic situation of all Caribbean states.

## Conclusion

After more than a decade of "soft" expansion, China is bringing to the Caribbean generous development aid, manufactured goods that have replaced more expensive American ones, and a Global South-centered emancipatory view of international politics. At the same time, there is an unsustainable bilateral trade deficit and a serious threat against Caribbean labor-intensive manufacturing industries. In order to prevent major negative consequences in the medium term, Caribbean states need to design and implement effective public policy responses in the fields of trade, investment, industry, agriculture, and tourism. In the long term, however, it is the course of the China-US relationship that will most likely determine the dynamics of the Chinese involvement in the Caribbean and its public policy effects.

# China's Belt and Road Initiative

Saleh Shahriar
Department of History and Philosophy, School of Humanities and Social Sciences, North South University, Dhaka, Bangladesh

## Synonyms

Belt and Road Initiative (BRI); China's global policy; One Belt, One Road Initiative (OBOR)

## Definition

The Belt and Road Initiative (BRI) is a Chinese trillion-dollar public policy and politico-economic strategy to advance globalization through the state-led cooperation in the areas of policy communication, facility connectivity, unimpeded trade, monetary circulation, and people-to-people understandings.

## Introduction

The Soviet Union collapsed in 1991. A year later, debates on China's power status began to emerge (Naughton 2017; Schweickart 2015; Xuetong 2006). The end of the Cold War, the fall of the Soviet Union, the triumph of economic liberalism, the decline of the US unilateralism, the world financial crises, and the rise of emerging powers in general and the rise of China in particular have been influencing almost every

aspect of international affairs (Jianwei 2017; Xing 2019). The economic rise of China is a global phenomenon. China became a member of the World Trade Organization (WTO) in 2001. Since China joined the WTO in 2001, the world has been surprised by China's rapid economic expansion. Its GDP grew at an average rate of 10.5% in the first decade of the new millennium, and China's share of world GDP doubled from 7.5% to 15% between 2001 and 2012 (Wang 2017). Entry into the WTO symbolizes the matrimony of China's crony capitalism (market Leninism) and global capitalism (Yue 2018).

China's average annual GDP growth rate slowed from 10.6% in 2010 to 6.6% in 2018 so that the BRI was devised as a global strategy. In 2013, China proposed the BRI to build a global community of shared destiny, peaceful development, and networks of partnerships (Chang-Liao 2016; Xi 2017, 2018). The BRI is a Chinese trillion-dollar project encompassing multiple global issues including the world economy, poverty reduction, environment, sustainable developments, agriculture, science, technology, education, infrastructure, and cross-border economic cooperation. The inception of the BRI began in 2013 when the Chinese President Xi Jinping unveiled it during his visit to Kazakhstan. In a speech at Kazakhstan's Nazarbayev University on 7 September 2013, he proposed the building of a Silk Road Economic Belt in order to expand the Eurasian economic cooperation. Again, in his visit to Indonesia, a Southeast Asian country, he proposed the concept of the Twenty-First-Century Maritime Silk Road. The BRI is never clearly defined; there is not even a correct, official map of the BRI (Narins and Agnew 2019; Zeng 2019). In Chinese Mandarin, the BRI is known as *Yi Dai Yi Lu,* 一带一路 (literally "One Belt, One Road").The total investment earmarked for BRI projects is said to be more than US$ 1 trillion; by some estimates it is as much as US$ 8 trillion (Shah 2019). Some believe that the BRI will dramatically expand Beijing's influence in the world, particularly in China's neighborhoods. Others feel the BRI will be hindered by many insurmountable challenges and its failure is almost guaranteed. Against this backdrop, the present chapter intends to discuss the main issues and dynamics of the BRI strategy of China.

## Scope of the BRI

The BRI involves countries spanning Central Asia, South Asia, Southeast Asia and Oceania, Central and Eastern Europe, West Asia, and North Africa, over 900 projects, and close to US$1 trillion as of mid-2018 (Yuan 2019). The BRI is a policy to advance economic globalization through the state-led cooperation. China's projected investment under the initiative ranges from US $ 1.4 trillion to US $ 6 trillion (Zhai 2018). The strategy of the BRI, a historically integrated concept in China's periphery policy, is a well thought-out global and grand strategy that the Chinese leadership has formulated to reclaim its geopolitical dominance in Asia and to fulfill the goal of China dream. With a projected US $1 trillion commitment from Chinese financial institutions, and at least 138 countries participating, the BRI is attracting intense debate (Oliveira et al. 2020). The BRI, in effect, helps China create a Chinese centered order in Asia and beyond (Bhattacharya 2016). As a policy-oriented initiative, the BRI has great potential to benefit many lower- and middle-income developing countries that are not adequately served by existing infrastructure and are strapped for new investment (Rana and Ji 2020).

## Aim, Structure, and Financing of the BRI

The BRI aims to establish cooperation in five major areas: trade and investment facilitation; policy coordination; infrastructure development and connectivity; financial coordination and integration; and people-to-people ties and connectivity (Panibratov et al. 2020; Shahriar 2019b).

As of January 2021, Table 1 shows the number of countries that joined the BRI by signing a Memorandum of Understanding with China is

**China's Belt and Road Initiative, Table 1** List of the BRI countries

140. China's BRI is designed to build global infrastructure and coordinate policymaking across Eurasia and Eastern Africa – as is widely seen as a clearly defined, top-down "grand strategy," reflecting Beijing's growing ambition to reshape, or even dominate, regional and international order (Jones and Zeng 2019). The BRI consists of the following two components:

- Land Based, the Silk Road Economic Belt (SREB)
- Sea Based, the Twenty-First-Century Maritime Road Initiative (MSRI)

The BRI is the flagship project of current Chinese foreign policy (Chan and Song 2020). Beyond politics and international relations, the BRI has a strong economic dimension, particularly in terms of energy security. Previous studies clearly indicate that Beijing has implemented more favorable foreign policies toward energy-producing countries because of its energy security concerns (Lee 2019; Zhang 2019). In the middle of 2017, the BRI was declared as project of the century. It proposed to build a total of six economic corridors: New Eurasian Land Bridge, China–Mongolia–Russia Economic Corridor, China–Indochina Peninsula Economic Corridor, China–Pakistan Economic Corridor (CPEC), Bangladesh–China–India–Myanmar (BCIM) Economic Corridor, and the Trans-Himalayan Economic Corridor. The BRI is a Chinese dream to reduce trade costs via a plethora of infrastructure development projects (Jackson and Shepotylo 2021; Zhao and Gao 2015). China has started the construction of high-speed rail since 2008, and ranks first in total operating mileage in the world up till now. The construction of high-speed rail improves geographical proximity by reducing the travel time and cost between areas (Wu 2020; Zhang et al. 2020). In other words, the rail connections under the BRI serve the national interests of China. Extending economic and political integration through rail connectivity is, therefore, a crucial step in building stronger ties between China and the BRI associated states (Wu 2020).

As an unprecedented endeavor to develop a social and economic nexus that connect China and the rest of the world, in November 2014, Xi Jinping, the Chinese president, announced plans to create a US$ 40 billion *Silk Road Fund* to support private businesses investing in the BRI projects. Several institutions and organizations such as the Asian Infrastructure Investment Bank (AIIB), the Shanghai Cooperation Organization, and the New Development Bank etc. have been created to finance the different projects of the BRI. The AIIB's launch has resulted from China's entering a new phase of development and further embracement of the world (Etzioni 2016; Liang 2020; Wang 2018; Xiao 2016)

Basically, there are five types of financial resources in China supporting BRI construction. They are pure aid, preferential loans, development finance, commercial loans, and various special funds (Lai et al. 2020; Liu et al. 2020).

## Policy Implications of the BRI

By means of the BRI, China wants to create a Chinese world order (Mações 2018). The BRI has, therefore, some policy implications:

- International actors such as governmental and corporate agencies should understand and take advantage of their potential in shaping the development and local practices of the BRI given the BRI's vague nature and lack of a clear blueprint.
- International actors should pay more attention to Chinese local and subnational actors as they have a higher level of discretion than expected and their interests can sometimes override that of the central agencies in Beijing. When it comes to specific business cases at the local level, Chinese state-owned enterprises and provinces – rather than the central agencies in Beijing – are the decisive players.
- China could come forward to investing in the areas of poverty alleviation and employment generation. China has pledged to invest US$ 1.25 trillion worldwide by 2025, exceeding any previous investment record made either by the USA or the Soviet Union in their past geopolitical rivalry for global domination (Shahriar 2019a).
- The developing countries are mostly deficient in the energy supply. The deficiency in the energy sector could be addressed by means of joint collaborative projects of trade and investments in the field of energy.
- China is a technologically advanced country. China's rapid economic development has not only increased the demand for natural resources but also raised the demand for advanced technology. It is anticipated that

advanced technology will enhance economic growth (Yao and Wang 2014). The transfer of technology could stimulate the growth dynamics of the emerging countries.

- Under the policy of the MSRI, maritime developments, especially ports constructions may further encourage growth dynamics in countries along the BRI (Sui 2018). Due to COVID-19 pandemic, the overall investments in the BRI during the first 6 months of 2020 dropped by about 50% compared with the investment during the first 6 months of 2019 (Chen et al. 2021a).
- China's early outward foreign direct investment (OFDI) was motivated by the state's "Going Out" strategy announced in 1990. Since then, China has emerged as a global investor in developed and developing countries. China has given its state enterprises a major role not only in producing for export and competing in international markets but also in investing abroad (Li and Cheong 2019; Shahriar et al. 2020). China is keen to establish the special economic zones (SEZs) and exports processing zones (EPZs) to promote trade and investment in the BRI countries.
- China has been advocating for the development of a green Belt and Road (Teo et al. 2020). Sustainability is mostly discussed in the context of environmental or social impacts of BRI. Sustainability may therefore be on the agenda, turning China's pledge for carbon neutrality by 2060 into reality with spare money to spend in a high-growth scenario (Schulhof et al. 2021). In other words, the BRI can help achieve the Sustainable Development Goals.
- Cross-border tourism is a possible area of cooperation. China's border tourism could advance economic prosperity in the BRI region (Chen et al. 2021b; Gao et al. 2019; Su and Li 2021). China wants to increase cross-border economic cooperation and integration along its peripheral underdeveloped areas and border provinces such as Yunnan (Ptak et al. 2020; Summers 2021).
- Climate change is one of the greatest global challenges. Relevant studies show that countries along this Twenty-Century Maritime Silk Road will witness significant sea-level rise (Tan et al. 2021). Most BRI countries need to enhance their research ability in the field of climate change through extensive international cooperation. Future researchers might pay more attention to how BRI countries will mitigate and adapt to climate change, as there is less research on this area compared to other issues.
- BRI project is ubiquitous in the global network of Confucius Institutes, which offer scholarships, as well as Chinese cultural and language trainings (Pantucci 2021). China offers generous scholarships and training facilities to the administrative elites and policymakers. This will, in turn, develop the skills sets of the global leaders.

## Constraints and Challenges to the BRI

The debt trap diplomacy is often projected as intended to exert undue political influence over sovereign nations that borrow from China under the BRI. However, there is no consensus among scholars on the question of debt trap diplomacy. For instance, Singh (2020) argues that the theory of debt-trap diplomacy does not accurately describes Chinese finance, because China does not engage in predatory behavior toward borrowing countries, using debt to facilitate takeovers of strategic assets and natural resources, or to promote military expansion. International players such as the USA, Japan, India, and Australia are apprehensive of the real intention(s) of the BRI, because of its ambiguity, lack of transparency, lack of consultation with the relevant stakeholders, and growing military presence in the -Indian Ocean, Asia Pacific, Indo-pacific, and the South China Sea (Blah 2018; Chakma 2019). The BRI projects have adverse impacts on the global environmental and climatic issues. Rana and Ji (2020) sketched some potential damages to environment due to megascale BRI projects across the regions.

The lack of coordination is also a major hurdle to the BRI projects. Another issue of contention is the trade disputes between the USA and China (Lu 2018). The outbreak of the coronavirus or

COVID-19 is one of the biggest problems causing the decline of China's image at the global stage. The COVID-19 may hinder the growth of the BRI.

## Conclusion

The rise of China is a global fact in the twenty-first century. The BRI is a manifestation of the global emergence of China. It has important implications in the fields of public policies and governance issues. China has developed a network of global trade, investment and financial integration. The creation of some economic institutions – AIIB for instance – gives a testimony to the fact that China has become more proactive in regional and global institution building. The cost-effectiveness of the BRI projects could be analyzed to understand the implications of those ongoing projects. Moreover, the costs of labor are on the increase due to the aging population in China. BRI would demand more skilled, efficient, and dedicated human resources to manage the vast volume of regional and global activities. The issues of human resource management would, therefore, emerge as an interesting area of research. The analysts may also focus on the integrated supply chain management, cross-border cooperation, and regional economic integration. The changing nature of the BRI population dynamics, production forces, trade networks, and consumptions could merit future scholarly attentions. Until now, there are still not enough research studies on how COVID-19 pandemic and the commercial and political conflicts influence the BRI.

# Christian and Evangelical Higher Education in America

Jennifer E. Walsh
Azusa Pacific University, Azusa, CA, USA

## Synonyms

Faith-based institutions

## Introduction

The history of Christian higher education is, in many ways, the history of the university itself. Formal advanced study grew out of the need to have well-educated ministers who could advance the work of the Church. In Europe, clerics, monks, and priests who enrolled in the very first seminaries were primarily focused on studying theology and the Bible, but the curriculum was later expanded to include the classical liberal arts, including the trivium (grammar, logic, and rhetoric) and the quadrivium (arithmetic, geometry, astronomy, and music). In medieval Europe, ecclesiastical and government authorities were intermingled, resulting in widespread government financial support for both the Church and its seminary institutions.

## Main Text: Christian Higher Education in America

In the American colonies, Harvard College was founded in 1636, just six years after Puritan settlers founded the Massachusetts Bay Colony. The purpose of the college was to educate a new generation of ministerial leaders to guide the church in the New World. Modeled after Emmanuel College at Cambridge University, the curriculum blended religion and theology with the classical liberal arts (Danforth Commission on Church Colleges and Universities 1966). In the years leading up to the American Revolution, other denominations established their own institutions of higher learning: Anglican leaders founded the College of William and Mary, Congregationalists founded Columbia College, and Presbyterian ministers established Princeton College (formerly the College of New Jersey). Instruction was offered from a nondenominational Protestant perspective, but compulsory chapel services reflected the institution's denominational heritage. Of the nine colleges established during the colonial period, only the University of Pennsylvania was founded without direct ties to the Christian church (Danforth Commission 1966).

The influence of the European Enlightenment that sowed the seeds of independence also impacted the character and curricula of young American universities. Christian philosophy and practice still governed the institutions, but the addition of formal seminaries in the early 1800s separated students who wished to become ministers from those who did not. Furthermore, the core curricula still focused on the classical liberal arts, but economic and cultural changes that occurred in the years following the War of Independence led to expanded coursework in the fields of business and law. Instruction was accomplished not through lecture courses, but through individual tutorials with one or two professors that culminated in a year-long course on moral philosophy (Noll 1987).

In the decades following the Civil War, American higher education changed dramatically. The rapid Industrialization of the American economy, combined with the influence of the German model of learning, which was grounded in scientific positivism, radically impacted the curricula. American universities began to adopt graduate study programs that allowed for in-depth study of the sciences and the professions, and baccalaureate students were freed from the rigidity of the classics – curricula designed to produce virtuous citizens – so that they could freely pursue course "electives" that would prepare them for specific professions or advanced study (Calvin College Curriculum Committee 1970).

The role of the faculty member during this period of transition changed as well. Previously, faculty viewed their job as teaching students about the good, the true, and the beautiful; therefore,

their ability to tutor students in theology, religion, and the classics rested more on their own moral excellence than on their academic credentials (Ramm 1963). However, as the curricula changed, faculty selection decisions were based less on moral character, and more on academic expertise. In exchange for their scholarly abilities, faculty were given the necessary tools – namely, laboratories, libraries, and graduate student labor – that would further advance their research agenda (Ringenberg 2006).

The religious nature of universities also began to change. Scientific positivism, which required that faculty seek truth through the application of the scientific method, posed challenges for faculty in departments of religion and Biblical studies. It also made it difficult for theologians to dispute other secular theories, such as Darwin's theory of macroevolution and Freud's theories on human psychological development. Even faculty at schools with clear ties to church denominations found it difficult to reject these new theories outright. Changes in leadership at the nation's leading universities also resulted in universities abandoning long-held Christian practices, such as mandatory attendance at worship services (Ringenberg 2006). Although the change was gradual, the landscape among the nation's first and finest universities had so sufficiently changed that they remained, at best, historically Christian.

## Birth of the Evangelical College

At the turn of the nineteenth century, Protestantism experienced a revival known as the Second Great Awakening. A century later, the idea of a Christian college received one of its own. The Danforth Commission (1966) estimates that between 1870 and 1910, more than eight hundred colleges and universities were founded, with the vast majority of these claiming some connection to a church or Christian denomination. They eschewed the empiricism that had transformed mainstream universities and sought to refocus instruction around religion, theology, and preparation for Christian ministry. Bible schools, which offered limited curricula, gave missionaries and other Christian lay workers an opportunity to receive some post-secondary training in subjects useful for their work (Ringenberg 2006). Two of the more well-known examples, Moody Bible Institute, near Boston, and the Bible Institute of Los Angeles (BIOLA), were intentionally founded in urban settings so that students could immediately put their new learning into practice. Moreover, such schools were particularly helpful to further the education of women. Some women lacked the educational preparation to succeed in a traditional college; others were denied admission because of their gender (Brereton 1987).

Other colleges sought to resurrect the classical liberal arts model of instruction that had first served the nation. Students were taught theology and philosophy, along with the other subjects in the classical canon, while at the same living in community around the central tenets of the Christian faith (Ramm 1963). In addition, these colleges stressed the need for Christian commitment to be evident throughout the institution. Administration, faculty, staff, and students could be drawn from a variety of Protestant denominations, but they must be united in their evangelical commitment to the Christian faith.

## Scrutiny of Evangelical Colleges

In the post-World War II era, enrollments in Christian higher education institutions began to increase. College was encouraged for both men and women nationwide, but parents were often reticent to send their students to growing state-sponsored universities because they were perceived as being too large and too secular. Evangelical colleges, in contrast, offered parents a "safe" alternative. The institutions espoused familiar, Protestant values; students were strictly supervised in campus housing arrangements; and Bible courses were embedded into four-year baccalaureate degrees that were increasingly accredited and thus respectable (Brereton 1987).

This renewed public interest in religiously affiliated schools and colleges prompted the Danforth Commission on Church Colleges and Universities to undertake a study in the early 1960s to assess their characteristics, including their religious associations and stated purposes;

their staffing and financial stability; the quality of their curricula; and their composition of their student bodies. More than a thousand institutions were initially contacted, and 817 were identified as having sufficient connection with a sponsoring church or religious body to participate in the study. Combined, they represented more than a third of all colleges and universities in the nation and enrolled between 15% and 20% of all college students. Protestant institutions represented more than half of all faith-based institutions; Catholic institutions, 42%; and Jewish institutions, only one percent (Danforth Commission 1966).

The findings of the Commission were mixed. Some institutions, in their estimation, were very good. They had a clearly defined mission and purpose, well-educated faculty, suitable administrative leadership, stable finances, adequate laboratories and library resources, academic freedom for both faculty and students, and curricula that prepared students for the workforce and/or advanced study. These institutions were also responsible for producing a large number of graduates who later went on to receive Ph.D. and M.D. degrees. Other institutions were not as good. Some institutions were led by presidents who lacked advanced degrees or had no prior experience in academia. Others were staffed by a small number of faculty who lacked terminal degrees. Institutions competed for the best students with low-cost public colleges and universities, so students were often less prepared than their public counterparts. In many cases, finances were unstable because institutions opened up without considering the market demand for private education in that area. Despite these negatives, however, the Commission concluded that church-sponsored institutions that promoted a clear mission and purpose occupied a valuable part in the higher education industry (Danforth Commission 1966).

## Taxpayer Support

Many small, evangelical colleges were able to remedy some of the deficiencies noted by the Danforth Commission by taking advantage of government and foundation grants to improve their campus infrastructure, improve faculty qualifications and training, and attract students who were able to afford private faith-based institutions through the help of Pell Grants, work study programs, and federally subsidized loans. These additional tuition funds paid for improvements in infrastructure and student support services that were necessary in order to receive regional and professional accreditations – a standard of quality and reputation that many thought might be out of reach. At the same time, small, independent colleges joined forces to form a lobbying organization that interceded with state and federal lawmakers for additional funding assistance: the Council for the Advancement of Small Colleges, which later became the still-operational Council of Independent Colleges (CIC), represented all private institutions, and the Christian College Coalition, now the Coalition of Christian Colleges and Universities (CCCU), formed a network of Protestant institutions that featured an active commitment to the Christian faith (Askew 1987). Not surprisingly, both associations are headquartered in Washington, D.C., where they have close proximity to congressional lawmakers and Department of Education officials.

A few institutions, such as Wheaton and Grove City College, expressed concern that accepting federal funds would mean yielding control to government authorities, but most believed that because Christian parents and students paid into the tax system, they, too, should receive some of the benefits. Additionally, evangelical institutions had reframed their mission in light of the public good, so asking taxpayers to support their educational mission, just as they did for other private institutions, seemed equitable and fair. This resonated with lawmakers, too. Congress exempted faith-based institutions from having to comply with certain federal laws that would preclude institutions from discriminating on the basis of religion, and they allowed religious institutions to request exemptions from other legal requirements would unduly interfere with their religious mission (Winter 1987).

Although the relationship between policymakers and faith-based colleges and universities has been generally cooperative and mutually supportive, two US Supreme Court cases suggest

that it may not always be so. In *Bob Jones University v. Unite States* (1983), the Court was asked to review a decision by the Internal Revenue Service to revoke the university's tax-exempt status because it engaged in racially discriminating behavior and, therefore, no longer fit the criteria for institutions eligible to receive tax-exempt status. At the time, Bob Jones University, a fundamentalist institution, prohibited interracial dating and miscegenation, but argued that these policies were grounded in their religious teachings and practices. Additionally, Bob Jones University argued that the government's actions violated their right to free exercise of religion. However, the Court disagreed, arguing that it had an "overriding governmental interest" in ending racial discrimination and that religious liberty could not be used as an excuse to infringe on the fundamental rights of another. The following year, in *Grove City College v. Bell* (1984), the US Supreme Court ruled against the institution stating that Grove City had to comply with federal gender equity requirements found in Title IX of the Education Amendments of 1972 if it allowed students with federal grant funding to enroll.

Because these two cases did not touch on issues central to the missions of mainstream evangelical institutions, their impact on Christian higher education was negligible. Recently, however, evangelical institutions have felt concern that the regulatory environment for all of higher education has started to become burdensome. For example, navigating the intricacies of federal financial aid forms has become easier for students, but more onerous for institutions. In addition, renewed attention regarding the problem of campus-related sexual assaults has led to increased measures by campus officials to ensure Title IX and Clery Act (1990) compliance. Finally, in May 2016, the federal government interpreted some provisions of Title IX as requiring all schools and colleges to accommodate transgender students with regard to bathrooms, locker rooms, housing, and other gender-specific facilities. This raised concern among many faith-based institutions that the federal government was beginning to encroach on areas that overlapped with their religious beliefs.

At this writing, faith-based institutions in California are facing some similar challenges on the legislative front. If bills pending before the legislature are passed, it would likely impede the ability of institutions to accept state-funded grants or to enroll students who pay a portion of their tuition with state-sponsored grants. Assembly Bill 1888, introduced during the 2015–16 legislative cycle, would preclude students with state tuition grants (also known as "Cal Grants") from using them at any private institution – secular or sacred. If the bill were to be adopted, students would be able to apply their grants toward costs only at community colleges, at institutions in the California State University system, and at the University of California campuses (California Legislative Information 2016). Proponents argue that, on principle, taxpayer funds should be only used to support attendance at state-sponsored institutions; however, others argue that students receiving Cal Grant funding are already under-resourced and that restricting their ability to use tuition grants unfairly limits their ability to choose where to attend college. Practically, the state-sponsored institutions would have a difficult time absorbing tens of thousands of students who would no longer be able to enroll at private institutions. The institutions are overcrowded, and they already turn away thousands of qualified applicants each year. On those grounds, the bill was stalled for the remainder of the 2015–16 legislative cycle.

However, Senate Bill 1146, introduced in February 2016 by State Senator Ricardo Lara (D-Bell Gardens), poses additional hardships for faith-based institutions. The purpose of the bill is to ensure that lesbian, gay, bisexual, or transgender (LGBT) students are afforded equal rights and treatment at all colleges and universities that accept state grants and contracts or that enroll Cal Grant students. The bill would not eliminate Cal Grant funding eligibility for faith-based institutions, but, rather, would create a private right of action under law. Students who believe that they have been discriminated against will have the ability to sue for injunctive relief, and possible punitive damages, in court. In later amendments to the bill, the religious exemption for hiring and

other personnel decisions was removed. That would mean that faith-based institutions would no longer be able to limit employment to coreligionists (California Legislative Information 2016).

Most California Christian colleges and universities have indicated that these conditions would be unacceptable. Deviating from an historic position on marriage and human sexuality would represent a contradiction with orthodox theology that would compromise their core beliefs. Additionally, being forced to hire non-Christians would weaken the institution's ability to function as a cohesive whole, dedicated to a common purpose and mission. If those changes were to go through, faith-based institutions argue that they would have to turn away hundreds, if not thousands, of Cal Grant students each year or enroll them by replacing those funds with scholarships of their own. The price for doing so, however, is currently out of reach for most faith-based institutions. Each student receives a maximum award of a little more than $9,000, and faith-based institutions who choose to fund that on their own could be potentially spending millions of dollars each year to maintain their current enrollment.

While the outcome is still unknown, many outside observers are predicting that such changes, especially with regard to LGBT-related policies, are inevitable. The US Supreme Court's ruling in *Obergefell v. Hodges* (2015), declaring that same-sex couples had a fundamental right to marry, put faith-based institutions in an untenable position of operating with policies that are perceived to be as discriminatory. Lawmakers, too, find themselves in a difficult situation. While they may recognize the many benefits that faith-based colleges and universities offer to students and to their communities, they also recognize that, at least on this issue, it is difficult to justify taxpayer support for institutions with policies that conflict with this fundamental right.

Religious college leaders are hopeful that arguments made in favor of institutional diversity, pluralism, and tolerance for all may be effective in securing a compromise. In California, Christian colleges and universities attract a significant number of racial and ethnic minority and first-generation students each year. This is partly because students are attracted to the institutions' missions and partly due to the fact that faith-based institutions are more affordable than other private institution options. Because of their size, flexibility, and active faculty engagement, students at Christian colleges and universities also have higher retention and graduate rates than comparable public institutions.

Interestingly, the threat of mission-ended policy changes has galvanized faith institutions to work together for the first time. Many of the evangelical colleges and universities view each other as potential competitors and have not, until now, organized themselves collectively for the purpose of political advocacy. However, when the threat of legislation first surfaced in Spring 2016, Azusa Pacific University, the largest evangelical Christian university in California, along with BIOLA, California Baptist University, Point Loma Nazarene University, Westmont College, and William Jessup University, began a series of weekly conference calls to strategize how to best communicate their identities, values, and contributions to legislative leaders. That expanded to include a dialogue with more than two-dozen institutions that included non-CCCU members and Catholics. At the same time, the CCCU has been facilitating conversations with university leaders outside of California so that they, too, are ready if similar legislation is introduced in their states. While it remains to be seen whether faith-based institutions are able to prevail in the current legislative battle, a continued partnership that extends beyond the Protestant evangelical community may lead to a more favorable political climate for faith-based institutions in the future.

## Global Developments

Although Christian higher education in the United States is facing some emerging policy threats, it is currently experiencing nascent growth across the globe despite an unfavorable political climate. Since 1990, nearly 150 Christian universities have been founded around the world, with most occurring in non-Western countries. There are

forty-six new institutions in Africa, twenty-five in Asia and Australia, and fifteen new Protestant institutions in Latin America, and enrollments at these institutions are steadily growing. In South Korea, where thirty percent of the population identifies as Christian, enrollments are now several thousand strong (Carpenter 2014).

But, just as in the United States, Christian colleges and universities abroad sometimes encounter challenges in their relationships with government officials. In China, for example, the Communist owns and operates all educational institutions and explicitly forbids institutions to have a Christian name or maintain even informal ties with a church. Yet, Chung Chi College of the Chinese University of Hong Kong is permitted to operate its Christian-oriented mission as long as it remains under the auspices of the Communist-run university (Ng 2014). Other institutions, such as those in Eastern Europe, are heavily regulated by the government, which has enacted policies that impacts faith-based hiring, admission requirements, and curricula (Glanzer 2014). In Brazil, Christian universities encounter a more favorable regulatory environment, but struggle to operate in a system that is wrought with severe economic inequalities (Fonseca and Santos 2014).

## Conclusion

The policy environment is not as hostile in the United States as it is in Communist countries or areas under former Communist control, but it still presents challenges for faith-based institutions that have traditionally enjoyed some measure of government aid and support for its mission and operations. Challenges that stem from Christian teachings on human sexuality and gender identity could result in a withdrawal of this support; yet, the effort of faith-based institutions to educate, mentor, and nurture underrepresented first-generation students could preserve political good will. Ultimately, it will likely depend on how successful faith-based institutions are in making their case directly to the American public. Lawmakers, like all elected officials, respond to constituent pressure ensuring that if public demand for institutional choice is strong, Christian and evangelical institutions of higher education should be in operation for years to come.

# Christianity and Meeting the Needs of the Poor, the Homeless, and the Imprisoned

Tom Duley
Missions and Pastoral Care, Bluff Park United Methodist Church, Hoover, AL, USA

## Synonyms

Christ; God; He; Jesus

## Definition

Dehumanization: is living a life that is less than what God desires for human beings.
Rehumanization: is the process through which human beings move back toward living the life that God desires us to live.
A *Christian* is a person who has decided to follow Jesus Christ.
Community: used generally refers to large groups of people. Used specifically, as in Christian community, it refers to a community which is drawn together by its common desire to follow Jesus Christ.

## Introduction

Should Christians care about the needs of the poor, the homeless, and the imprisoned? The emphatic answer in this article is yes! Without question concern for the poor, the homeless, and the imprisoned is an integral part of what it means to follow Jesus. The following paragraphs will discuss some of the problems Christians face in living out that concern as well as some of the opportunities we have to do so.

## Sin Dehumanizes

Much to our dismay it turns out that human relationships have been co-opted by the forces of dehumanization. Dehumanization is the outcome of the cumulative effect of sin in human life. It happens when human beings settle for living in relationships with one another in a way that is different from what God desires. Evidence of this is all around us. Every time we resort to violence rather than love, we are settling for less than what God wants. Every time we give into fear rather than moving forward in faith, we are settling for less than God's best for us. Every time immense wealth is gathered into the hands of the few rather than shared among the many, we are settling for less than God's best for us. Unfortunately, much in our human relationships has been severely degraded to the point of dehumanization.

Of course, Jesus was well aware of this. One scene (of many) which illustrates this awareness is found in Mark 10:35–45 (with a companion text in Matthew 20:20–28). It is the account of James and John asking for what they presumed to be their rightful places in the Kingdom (Reign) of God which they further assumed Jesus was going to establish immediately. It was a power play through which they hoped to get the jump on the other disciples. It was an attempt to garner power and prestige through which they could lord it over others by acting tyrannically. It was a move right out of the human playbook of domination and dehumanization.

Jesus' initial response to their request points out the degraded and dehumanized nature of what they were asking. Jesus described the dehumanized nature of human relationships among those who conduct business as usual by saying "their ruler's lord it over them, and their

great ones are tyrants over them." He then turned to his disciples and said, "it is not so among you; but whoever wishes to become great among you must be your servant, whoever wishes to be first among you must be slave of all." In other words domination, power, and tyranny miss the mark of how God wants human relationships to be conducted. Instead, Jesus holds up service to one another as the true mark of how God wants human relationships to be conducted. Following Jesus means accepting and living in this alternative ethical system based in the divine.

## Jesus' Alternative

James and John make a request that is firmly based in the dehumanizing system of domination and tyranny. They want to be in positions of domination and power over others. Jesus rebukes them in stern and unequivocal language that is designed to remind them of the rehumanized humanity that he envisions. Jesus concludes by stating that he is the model for this rehumanized humanity because he has come to serve by giving his life as a ransom for many in the hopes that by doing so the many would experience the rehumanized life of God's reign. Jesus turns the disciple's attention to his actions at this point to emphasize that his actions are based in a divinely inspired ethic of service, love, nonviolence, and self-sacrifice rather than domination, power, and tyranny.

Jesus clearly recognized that human relationships have been co-opted by the forces of dehumanization. It isn't surprising then that Jesus spent his time on earth teaching about an alternative way of life based in a divinely inspired ethic that leads to a radically different understanding of human relationships. When entered into this alternative way of life taught by Jesus, it leads to rehumanization. Jesus called this alternative way of life the Reign of Heaven (God). He took the task of rehumanization upon himself when he began his public ministry by proclaiming the Reign of Heaven (also Reign of God) (Matthew 4:17, Mark 1:15, Luke 4:14–30 and 42–44, and John 3:1–3). Jesus' proclamation of the Reign of God is the proclamation of God's desire to see human relationships rehumanized rather than dehumanized.

## The Christian Task

The Christian task then is to cooperate with Jesus in the work of rehumanization. This is the goal toward which all efforts at meeting the needs of the poor, the homeless, and imprisoned must be directed. The overarching purpose that those who work in this arena are trying to achieve is that of a rehumanized humanity. This forms the spiritual underpinning for the work of meeting the needs of the poor, the homeless, and the imprisoned.

This is worked out in any number of ways, but the goal of the work is always the same, to rehumanize that which has been dehumanized. It must be said that this work does not just involve the poor, the homeless, and the imprisoned. It involves all of us. No one is exempt from the need to experience rehumanization. It is not about the segment of society which has resources doing something for another segment of society which doesn't have as many resources. This approach simply reinstitutes the hierarchical structures that got us here in the first place.

"Meeting needs" means meeting the needs of everyone concerned, and even though we like to tell ourselves that we are separate from one another, we aren't. There is no us and them. It is simply and always us. In the truest sense of the phrase, we are all in this together. We will only make progress when our efforts are cooperative efforts that affect change that rehumanizes everyone involved. The rehumanization project of the rich, the housed, and the free will likely not be the same as the rehumanization project of the poor, the homeless, and the imprisoned. However, the two projects are deeply intertwined. If we are to make any progress toward eliminating poverty, eradicating homelessness, and freeing those in prison, we must realize that we are all complicit in the current situation and that all of us together have created the situation we now face and it is incumbent on all of us to take the necessary steps to rectify the situation.

## Jesus' Alternative

Again, Jesus recognized this very clearly. He could easily have approached his work as an individual making his way around Palestine on his own like some modern-day inspirational speaker. But that is not what he did. From the very beginning, Jesus gathered a community of people around him (Mark 1:16, Matthew 4:18, John 1: 43). Of course, this insured that the work of Jesus would be considerably more complicated given the fact that those he called were themselves in the grip of the dehumanization that Jesus came to address.

Doubtless Jesus entered into community for many reasons. One of those reasons was to model for us the truth that human life is meant to be lived in community not isolation. Human life is intertwined. We are a community not a group of individuals moving about independently of one another. The community that Jesus gathered around him was gathered to serve as a model for those who want to learn from him and live as he lived. Christians who are serious about addressing the problem of dehumanization and particularly the outcomes of poverty, homelessness, and imprisonment must take Jesus seriously when he teaches us that there is no us and them and there is only us. We got into this as a community and we will get out of it as a community or we won't get out of it at all.

## Not Solely a Problem of Individuals

This work must take seriously all levels of human experience because dehumanization has occurred at all levels of human experience. Because of this the work of meeting needs must focus on structures and systems as well as individuals. One of the problems that complicates this work is the problem of believing that solutions can be found if only individuals will be responsible, work hard, and obey the law. Some say that it all comes down to individual responsibility. Individual responsibility is indeed important when it comes to addressing the problems of poverty, homelessness, and imprisonment, but it is never the total answer.

I personally know many poor and incarcerated individuals who are responsible, work hard, and obey the law. However, they make very little if any progress toward leaving poverty or being released from prison because of the systems and structures that have been placed on them by the political and policy decisions made by the wider community. Poverty-level wages, life without parole sentences, lack of public transportation, poor education, and many more hurdles are placed in the way of individuals by the structures and systems imposed by the wider community. Until the wider community decides to change these unjust structures, all the individual responsibility in the world will do no good.

## Systems and Structures

Christians involved in this work must insist that it is not only individuals that need to be rehumanized but the very systems and structures that we have created also need to be rehumanized. Structures and systems imposed by the wider community keep the poor poor, the homeless homeless, and the incarcerated incarcerated.

The dehumanizing effect of human structures and systems is very evident when we look at how our society approaches what is cavalierly called "corrections." What we refer to as "corrections" is actually an elaborate and expensive system of retribution and revenge which has virtually nothing to do with correcting anything. If corrections are understood as a process of rehabilitation through which an individual moves from criminal activity to rehabilitation to release to productive citizenship, we are failing at an alarming rate.

According to the Bureau of Justice Statistics, a 30-state study revealed that from 2005 to 2010, 67.8% of those who were released from prison in one of the 30 states studied were back in prison within three years; 76.6% were back within five years. The prevalence of high recidivism rates is a clear indication that we are not doing well in meeting the goal of rehabilitation. Clearly retribution and revenge don't help those who have been involved in criminal activity make a better choice. Locking them up and throwing away the key is not a solution to the problem. This approach

doesn't meet anyone's needs be it the individual who is incarcerated or the society that incarcerated that individual. It is often said that prison is a place that creates better criminals. The high recidivism rates would indicate that they are not necessarily better criminals because they keep getting caught. However, it is clear that they are not rehabilitated because they return to that which got them locked up in the first place.

## Jesus' Alternative

Prison and punishment come in for close attention by Jesus.

In Luke's Gospel Jesus announced his agenda by describing the work of the Reign of God that he came to proclaim and implement (Luke 4:18–19). Using words originally spoken by the prophet Isaiah, Jesus proclaimed that one aspect of his divinely commissioned work that leads to a rehumanized humanity is the release of captives. Luke 4:18c says, "He has sent me to proclaim release to the captives." God anointed Jesus for the work of releasing captives not keeping them incarcerated. It must follow that those who follow Jesus are called to the same work. From this we can assume that rehabilitation that leads to release not interminable incarceration is God's will for humanity.

It is instructive to note that Jesus didn't say he came to do away with captivity altogether. Unfortunately, the sad truth is that a dehumanized humanity necessitates corrections facilities. Criminal acts that damage others and society as a whole require society to act to remove such individuals from the greater society. This must be seen as an unfortunate consequence of our dehumanization. It should cause tears to well up in our eyes rather than shouts of glee emanating from our lips. Individuals who damage others and society must be given a time and a place apart from society. However, in order to conduct that time apart in the Spirit of Jesus, the goal must be for rehabilitative purposes and never for purposes of retribution.

With that said we must realize that Jesus' primary concern is for how those who commit these acts are treated. His concern is with the ultimate goal of their incarceration. We must ask ourselves this question, is the goal of incarceration retribution or rehabilitation? Given the teaching of Jesus, for Christians, the goal of incarceration can only be rehabilitation.

Given that retributive incarceration is incompatible with the rehumanized humanity of the Reign of God, Christians must see rehabilitation as the goal of any corrections system that is organized to deal with those who have committed crimes. A corrections system that is organized to be punitive in nature doesn't change anything or anyone. Hostility only creates more hostility. That system simply reinforces the dehumanization that led to the criminal behavior in the first place. A corrections system that is organized with rehabilitation at its center at the very least has a chance to rehumanize those who have committed criminal acts so that they will not be involved in that behavior when they are released back into the larger society.

Christians who work on issues of poverty, homelessness, and imprisonment must always keep before them the fact that our efforts must be aimed at rehabilitation. This includes the rehabilitation of individuals and the rehabilitation of the systems and structures that have produced poverty, homelessness, and imprisonment.

## Carried Out in the Public Sphere

Christians who take seriously the call to make their faith real by joining with Jesus in his program of rehumanization must move forward with that work in the public sphere. The dehumanizing structures and systems that have produced the fruit of poverty, homelessness, and incarceration are an outworking of our common life together as expressed in public policy worked out and enacted through the political process. Any Christian who wants to have a substantive impact on these problems must become involved in the political process.

Let me be clear. I'm not speaking here of partisan politics of Democrats and Republicans, Libertarians and Socialists, and on and on. Yes, when we enter into the political process, we will come into contact with all of these folks and more.

It seems there is no end to the number of political opinions and policy ideas that float through the political process wherever one may find oneself. The involvement I'm speaking of is not the involvement of one partisan against another partisan vying for domination. That is antithetical to the teaching of Jesus. (See above)

The politics I'm speaking of is a politics that truly takes the common good seriously, realizing that until justice is reached for all, it isn't reached for anyone. A politics of the common good realizes that when a few are hungry all are hungry and when a few are imprisoned all are imprisoned. That seems to be what Jesus was getting at when he said, "The Son of Man came not to be served but to serve." A politics of domination and tyranny leads only to the good for a few. A politics of service and compassion leads to the common good which is a blessing to all.

For Christians approaching the political process in this manner, individual policies become more important than a grand sweeping ideology that seeks to include and explain all politics. In some instances a conservative approach to a particular policy problem might be just the right approach. On the other hand, there will be times when a progressive approach hits the mark. Christians need not lock themselves into thinking but remain open to what is suggested wherever the suggestions comes from. The question that must frame our politics is the question of the common good. Does this particular idea or piece of legislation lead to the common good, or is it only good for the few?

The same Jesus who was anointed to proclaim release to the captives was also anointed to "let the oppressed go free" (Luke 4:18). Too often the political process favors those with the most while punishing those with the least. Christians can never be satisfied when this happens. We are called to work for the freedom of the oppressed as surely as Jesus was. We must be bold in identifying oppression when it occurs and in working to free those who are the victims of oppression.

Christians must be savvy enough to realize that we are called to follow Jesus in his program of rehumanization, not to become embroiled in the partisan political clashes that are designed to prove one party's dominance over the other. This approach calls for a decidedly nonpartisan politics focused on policies designed to achieve the common good, focused on policies that put an end to oppression, and focused on policies rather than ideologies of either left or right. This calls for alliances with all sorts of different people and groups seeking to work through the political process toward goals that help to bring about the rehabilitation and rehumanization that is a hallmark of Jesus' teaching.

## Government

Christians must also become comfortable with the notion that some (perhaps many) of the things that we want to achieve with this rehabilitative political work can only be accomplished through governmental structures. The problems of poverty, homelessness, and imprisonment are too big for any one entity in society to solve in any sustainable way. Government must be involved as the primary player in tackling these problems.

This reality creates a tension that is inescapable given the fact that many Christians (and others) distrust government. Unfortunately, much of the dehumanization that we observe in human society comes from the administration of our public life together that we call the government. Much of the rehumanization that needs to occur needs to occur in this sphere of human interaction. The tension between the distrust of government and the need for government involvement in solving these problems is something we must live with not withdraw from. The truth is that it is often the government that has the expertise and the resources to make a difference.

One of the things that we often hear from some politicians and some religious leaders when the issues of poverty, homelessness, and imprisonment are discussed is this, "let the churches deal with it." This is usually said when a politician or someone else is trying for various reasons to excuse the government from involvement in the struggle to resolve these vexing problems. A cursory examination of the facts reveals that that just isn't a realistic option.

This can be illustrated by a brief look at my own state of Alabama. According to the US Census Bureau, the 2015 population of Alabama was 4,858,979. According to the Talk Poverty website, the poverty rate in Alabama in 2015 was 19.3%. That means that 937,782 Alabamians (plus or minus) lived at or below the poverty line in 2015.

This is a staggering number.

According to ExpertGPS, there are plus or minus 12,833 churches in Alabama. Undoubtedly, that is a lot of churches. However, we must remember that that number includes large-size churches, medium-size churches, and for the most part small-size churches.

In my own United Methodist denomination, there are about 850 United Methodist churches in the North Alabama Annual Conference which covers roughly the northern half of the state. 67% of those churches average fewer than 100 people in worship each Sunday. Many of that number average fewer than 50 in attendance for Sunday worship, and it is not uncommon to have fewer than 25 for Sunday worship. In the North Alabama Annual Conference, the vast majority of churches are small sized rather than medium to large sized. This is true across the board whether we are talking about denominational or independent churches.

Michael Bell in a 2009 article on the blog Internet Monk analyzed data from the National Congregations Study (Mark Chaves, Professor of Sociology, Religion, and Divinity, Duke University, 2006–2007). Bell discovered that the average size of a Christian congregation in the USA is 184 with fully half of those congregations consisting of 75 members. The vast majority of Christians gather in small, not large, groups.

If churches alone took on the responsibility for combatting poverty in Alabama, it would mean that each church regardless of size would be responsible for alleviating poverty for 73 people. If we assume, for the sake of our process here, that there are four people in each family, there are 18 families for whom each church would have to design and support a program to lead those families out of poverty. This would be true for large churches, medium churches, and small churches. Such a task would be daunting for the largest and richest churches in the state. It would be totally impossible for the vast majority of churches in the state.

Of course, since there are so many variables involved in a problem as vast as poverty, this is an inexact scenario, but it does illustrate the point that dealing with the issue of poverty is beyond the capability of the churches to do on their own. In order for poverty, homelessness, and imprisonment to be dealt with in any meaningful way, the government must be involved in the process along with all of the other institutions which make up our society.

Christians desiring to make a difference in regard to poverty, homelessness, and imprisonment must share Jesus' passion for the rehumanization of humanity (all of us). We are all damaged by the destructive effects of dehumanization. Poverty, homelessness, and imprisonment are certainly signs of that dehumanization. However, the way we address (or don't address) these issues is also often a sign of dehumanization. Low wages, lack of adequate health care, poor education, and the billions we spend on war are signs of that dehumanization.

However, we are not damaged beyond rehabilitation. Change that moves us closer to the rehumanized humanity that Jesus envisions in the Reign of God can and does occur both in the lives of individuals and in the structures and systems that support human life. Christians must always remember that our faith is in the God who makes all things new. This is absolutely essential to this work.

To work toward this change, we must realize that all of us are part of a community. Human life is intended to be lived out in community for good and for ill. We must also realize that political involvement is an absolute necessity for those involved in the struggle. Not partisan politics so often results in more destruction but a politics that is truly concerned with an end to oppression through achieving the common good. And, we must make a place for government (and other institutions) as partners in the struggle.

I teach a weekly class with inmates at a local prison. The prison I work in is a high-security

facility that houses many inmates with life without parole sentences, life with the possibility of parole, and other long sentences. As I was thinking about this article, I asked the men in my class to tell me what they thought Christians needed to overcome in order to do something positive about the problems associated with incarceration such as overcrowding, recidivism, etc. In this exercise we weren't focusing on questions related to systems and structures. It was strictly on a personal level. The answers they gave were very instructive about the attitude they see most Christians having toward them.

They said these were some of the things Christians would have to get over:

- Fear of being hurt or harmed in some way
- Believing that the inmates won't really appreciate the efforts of volunteers
- Believing that the only thing the inmate wants is money
- Believing that all inmates are evil, that all inmates are liars, and that you cannot trust any of the inmates
- Not knowing what to say to a murderer, rapist, etc.

These answers reflect the fact that these incarcerated men see Christians as people who, should they enter a prison in the first place, will do so with deep suspicion of those who are there. Further conversation revealed that the men in my class had, over the terms of their incarceration, encountered Christians who dealt with them from a starting point reflective of those listed above, in other words, beginning from a position of suspicion rather than a position of openness to what God might accomplish through their efforts. Broadly speaking, most of the Christians they had encountered entered the institutions where these men were serving time thinking of them as less than human.

In order for Christians to make a difference in meeting the needs of the poor, the homeless, and the imprisoned, we must take seriously Jesus' call to community, our involvement in the political process, and the involvement of the government as a part of the solution to the problems.

However, for Christians the very first thing we must do individually and as a community is to join Jesus in insisting that no person in any circumstance is less than human and no person is beyond the reach of God or the love of God. Admittedly, the men I polled in the exercise described above form a small group, but I am confident that if I increased the sample size, I would be given very similar answers.

It is very probable that for Christians the healing that is necessary to address the needs of our poor, homeless, and imprisoned brothers and sisters begins deep within us when we realize that we too are in need of the rehumanization program that Jesus offers; we too are far from the Reign of God. And perhaps our rehumanization needs to start with the realization that there is no them and us; there is only us. And God loves every single one of us. May we dedicate ourselves to following the simple command of Jesus, "In everything, do to others as you would have them do to you; for this is the law and the prophets" (Matthew 7:12).

## Conclusion

Most Christians think that being Christian is about believing in God. It's about an intellectual exercise that responds positively to the question, "do you believe in God?" Once that is settled little else matters. However, that is most decidedly not the central question of the Christian faith. The central question of the Christian faith is "are you a follower of Jesus?" Following Jesus is a completely different starting point in the life of faith.

Why do we care about the poor, the homeless, and the imprisoned? We do so because Jesus clearly cared deeply for those who find themselves in that position. It's as simple as that. How do we as followers of Jesus go about the work of meeting the needs of the poor, the homeless, and the imprisoned? We do so in a manner that rehumanizes rather than dehumanizes, a manner that is consistent with the alternative way of life that Jesus called the Reign if God. It's as simple as that.

To God be the glory.

# Churning

Étienne Charbonneau and Nicholas Bautista-Beauchesne
CERGO research center, École nationale d'administration publique, Montréal, QC, Canada

## Synonyms

Accountability and democratic administration; Bureaucracy and stability; Integrated management system; Organizational cheating; Performance management in the public sector

## Definition

Churning is the change, modification, or destruction of measures, indicators, and/or data. This includes replacing one performance measure by another, refining the definition of the components and weights of existing measures and indices, as well as adding or deleting new measures over time. According to Bourgault and Savoie (2009: 8), churn comes from the contraction of change and turn.

## Introduction

The constantly changing nature of performance indicators becomes apparent if one carefully observes them (Bawole and Ibrahim 2018: 3). Despite the fact that some measures are available in major OECD countries, since 1950 – such as GDP per hour worked – temporal, legal, or cost considerations, as well as changes in priorities, inevitably lead performance measures to change. Even if meaningful temporal comparisons are needed, the main driver for the absence of stable indicators seems to be the political landscape in which public organizations operate. Particularly, electoral cycles can encourage the modification of reporting frameworks. Moreover, the nature of the issue being measured may equally foster churning in the context of complex goals.

From the accountability holder's or manager's point of view, the churning of indicators is an alternative to setting more demanding targets, once the majority of participant organizations in a performance regime are deemed acceptable or excellent. Furthermore, the alignment between a measure and a mission objective might shift in time, insofar as bureaucrats are in the position to introduce modifications according to all possible and relevant strategies (van Helden and Reichard 2018: 6), even at the expense of added program value. This has been considered as "one of the most vexing issues" for system designers (Heckman et al. 2011: 308). Indeed, the rate of churning can certainly increase, when public organizations migrate from measuring stable input and output measures to volatile outcome measures.

## Explanations and Effects

On the management front, honing a new performance dashboard could mean the modification of up to a quarter of all measures yearly, though this could potentially foster confusion and a possible

lack of motivation from managers (Henri 2010: 78). Moreover, a lack of stable indicators could reduce potential control across agencies and levels of government.

Furthermore, *learning* – an essential rationale of performance management – is also potentially hampered, which is usually achieved by comparing one's current performance with one's past performance (Van Dooren et al. 2010: 98, 107). As such, learning is also encouraged through the long-term effects of management changes.

The data volatility produced by churning poses a puzzling paradox for public administration, insofar as this destructive phenomenon is arduously reconcilable with the supposed evidence-hunger of public management. To explain this phenomenon, four root causes are put forward by Hood and Dixon (2015: 55): democratic responsiveness, track-covering activities, sociotechnical responsiveness, and organizational dynamics. Democratic responsiveness signifies the change in performance indicators associated with shifts in values, ideologies, and political agendas which are produced by the course of democratic processes (Ibid.: 56). Track-covering activities denote deliberate acts of destruction or tampering in order to obscure failure or success, whereas sociotechnical responsiveness describes the neutral and pragmatic modification of indicators which accompanies societal and technological changes (Ibid.: 57). A useful parallel can be made between track-covering activities and blame-avoidance theory (Hood 2011): one can posit that in order to avoid the blame that may accompany policy failure, actors may seek to modify performance measures to prevent further blame or to incorporate new measures and results in future strategies to mitigate blame. Finally, the fourth root cause of churning is organizational dynamics. This explains the source of churning from: "processes going on within and between agencies and bureaucracies (and the personalities and politics in play at that level) as from the declared agendas and changing preoccupations of elected politicians claiming to represent the will of the electorate" (Hood and Dixon 2015: 57). Within their study of the British government, Hood and Dixon (2015: 61) found that organizational dynamics accounted for the majority of data breaks.

One emergent recommendation for public servants to deal with churning is to be mindful of trade-offs, thus reflecting the same issues encountered with performance management more broadly (van Helden and Reichard 2018: 5). On one hand, upgrading performance measures over time can improve its validity to reflect current realities; on the other hand, it weakens the ability to compare one's data over time, thus limiting accountability to the public and inhibiting learning from managers (Pollitt 2009: 212). Nevertheless, validity concerns are oftentimes prioritized over multiple-year comparisons.

However, what is seen as a possible upside for management is understood as a downside for research, as a modification of measures and indicators invariably causes data to be unstable. The churning of indicators and data constrains researchers to devote time and effort to reconstruct databases which present discontinuities. Hood and Dixon (2015: 49) even propose a classification of the impact of these data irregularities, where small discontinuities require little effort and time before being usable, a medium impact necessitates considerable labor and corrections, and a large impact renders a comparison of trends either meaningless, impossible, or subject to crippling uncertainties and could even mean the disappearance of the measurement (Ibid: 49).

In some cases, the churn of performance measures makes evaluations of trends uncertain or impossible and "before and after" studies that much more arduous. The paucity of certain types of variables, as well as over-aggregated data, might limit testing for multicausal processes, even with databases with large sample sizes (Forbes et al. 2006: 268). For example, the unavailability of time series data rendered indiscernible the occurrence of alleged reversals and overloads of policy reforms (Van Dooren et al. 2010: 146). Even if the demand for such time series is scant for public sector analysts, the underlying logic in maintaining time series of comparable performance indicators can serve as a contingency in case a specific issue arises once more.

Despite these obstacles, practical recommendations, reminders, cautions, and suggestions about how to navigate around churning are to be found. For instance, comparing the latest overall outcomes, to outcomes from previous time periods is the first basic step for analyzing program data for public managers and analysts. "(T)o track changes in outcomes after the introduction of new program practices, data for several periods after the introduction of the new practices should be compared to data for several periods before their introduction" (Hatry 2006: 141). However, because no guideline exists, it remains unclear how far one should go back, or what "several" means.

## Empirical Evidence

Even if empirically assessing the prevalence of churning in the public sector is an arduous task, Hood and Dixon (2015) argue that churning does provide insights into the shifts and changes of government bureaucracy. Studying churning in five departments in New Zealand between 1992 and 2002, it was found that "procedural organisations altered their output classes and performance indicators more than both craft and coping organisations" (Lonti and Gregory 2007: 477). Efficiency measures were seldom and even fewer of them were stable: assessing cost-effectiveness over time was impossible. For the treasury department, the survival rate for output classes was only of 25% for the period. The authors speculated that a high churning rate could reflect an effort from officials to present performance in the best light possible (2007: 480). Elsewhere, Leland and Smirnova (2009: 857) found that withstanding two exceptions, the American National Transit Database enabled them to compare public transit privatization several years apart without many roadblocks. In Westminster parliamentary systems, the churning of indicators is compounded due to the volatility of ministries and agencies. In their study of agencification in the Canadian province of Quebec over a period of 9 years, Vining et al. (2015: 105) were not able to study two out of the eight agencies in the sample, because one was merged with another agency, and the other was privatized. In their detailed study of agency termination, James et al. (2016) found only two cases over the period spanning 1989–2012, where the functions of a UK executive agency were terminated completely. However, there was much turbulence in the number and arrangement of these agencies. Indeed, the authors report that the estimation sample varied over this period, whereby 109 agencies were terminated, with the longest agency lifespan being 24 years, the shortest 3 years, and an agency's mean lifespan was 8.8 years, with a median of 7 years (James et al. 2016: 774).

Again in the Canadian context, a study of 383 private Canadian manufacturing firms in 2002 found that low performance, as measured by sales volume, return on investment, and profits, was negatively correlated with a periodic review of performance indications, which was understood as deleting, adding, and changing the definition of targets and measurements (Henri 2010: 84). The author commented that:

> the costs of not having updated performance indicators (i.e. indicators that are less relevant and appropriate; less alignment among strategies, actions and indicators; indicators reflecting less ability to discriminate good from bad performance) appear to be greater than the costs of unduly reviewing performance indicators (i.e. human, technological and financial resources to periodically refine indicators; potential confusion and lack of motivation among managers and employees; disruption in the collection of longitudinal data). (Henri 2010: 88)

Within the context of Quebec municipalities, churning was identified by a few General Managers as one of the reasons – albeit an infrequent one – for the absence of performance indicators in decision-making (Charbonneau 2010: 215).

### Goodhart's Law

Assessing performance reforms in England, Hood (2008: 10) opined that learning had been difficult because of:

> truncated runs of data caused by high churn rates in targets and never-ending alterations in the composite measures used to evaluate local authorities and health trusts." In turn, this instability was caused by

> efforts to counter the problem of Goodhart's law, and to "stealthily bury targets that had been embarrassingly failed. (Hood 2008: 10)

To explain, Goodhart's Law states that: "Any observed statistical regularity will tend to collapse once pressure is placed on it for control purposes" (Goodhart 1984: 94). In the context of performance management, this signifies that data collection for designated targets by public servants and managers may change their behavior over time; elements of gaming could potentially seep between what is expected and what is actually done. As a concrete example, Goodhart's law was suggested as a way to understand the determinants of performance improvement in the first rounds of the Comprehensive Performance Assessment municipal regime in England (Gutiérrez-Romero et al. 2008: 784). Moreover, the phenomenon was identified as one of the flaws of the target-rich English model, compared to other regimes in Wales and Scotland (Haubrich and McLean 2006: 291). A proposed remedy to prevent its occurrence is to periodically change the number and definitions of indicators (Hood 2008: 11). However, this runs the risk of hampering learning opportunities, whereby comparisons of values to previous periods become harder or impossible. Thus, Goodhart's Law is at the center of the performance paradox; on one hand, stable measures could foster learning and have the potential to overcome a purely symbolic use of performance measures by high-ranking officials, while on the other hand, unstable measures often deter gaming (Pollitt 2013: 354).

## Conclusion

The churning of performance measures, as well as the ensuing data volatility and discontinuity, poses unique obstacles both to practitioners and scholars of public administration. At the least, the monitoring and management of messy and complex issues are to be reconciled with validity concerns and the variability of political cycles. To be clear, churning does not equate to the changing performance levels of stable performance measures. However, the modification of indices and measures, whether it be for gaming and blame avoidance reasons, or for the sake of keeping up with a constantly changing social and technological environment, challenges practitioners to be mindful of trade-offs, and scholars to devote attention and effort in order to use the affected databases.

## Synonyms

Climate crises; Climate emergency; Global warming

## Definitions

Climate change — The Framework Convention on Climate Change (UNFCCC), Article 1, defines climate change as: "a change of climate which is attributed directly or indirectly to human activity that alters the composition of the global atmosphere and which is in addition to natural climate variability observed over comparable time periods" (IPCC 2018).

## Introduction

Urban development and management are critical components of the current and future trajectory of climate change. With city populations increasing at a rapid pace and more than two billion people projected to be moving into urban areas by 2050, the dual issues of cities as drivers of climate change and engines for response are linked to both effective management and policy. Global temperatures increased 0.74 °C (C) over the last century, with potential increases of up to 6.4 °C in the next (Tanaska 2014). Ambitious goals set by the global community at the World Climate Summit in December 2015, are reflected in the Paris Agreement binding parties to institute measures to hold temperature increases to 2 °C in global mean temperature relative to preindustrial levels and limit warming to 1.5 °C (Vicedo-Cabrera et al. 2018). Countries set out Nationally Determined Contributions to reach this goal.

Expected increases in urban populations, particularly in low- and middle-income countries, pose ongoing challenges because cities are traditional "hotspots" with respect to factors linked to climate change due to their primary role as the base for societal economic activity. Cities became increasingly attractive to those in rural and suburban areas, now drawing one million weekly. Urbanization accellerated rapidly in northern countries after the mid nineteenth century and southern countries a 100 years later. Spacial clustering was attractive due to factors including lower cost and ease of transportation, job opportunities, agricultural displacement, access to

services, and cultural stimulation. Economic geography was shaped by new forces of globalization and changing linkages between consumers and suppliers. Expansion of large city agglomerations known as megacities as consumption and production centers is characterized as "intensive, rapid and disordered" (Hoole et al. 2019, para 8, Sassen 1991) Growth of megacities with populations over ten million, means the 33 in existance in 2018 are likely to increase almost one-third over the next 12 years. This will excellerate demands for critical services including energy, transportation, housing, food and waste disposal, and industrial activity each linked to substances responsible for global warming. Impacts of global climate change now pose complex tradeoffs for city policymakers and administrators charged with delivering sustainable economic development and growth.

## Causes of Climate Change in Cities

The UN Intergovernmental Panel on Climate Change (IPCC), the principal body designated to deal with the science of climate change, warns the current pace of emissions is in line with a high emissions future, if effective policies are not enacted and implemented that quickly move toward concrete management of climate threats. Affluence is directly linked to climate change with high-income cities such as Seoul, Guangzhou, New York, Hong Kong, and Los Angelos, forming the top five cities in the world with the largest carbon footprints (Charlton 2018). This correlates with findings that per capita GDP in various cities is positively associated with $CO_2$ emissions, generation of waste per capita, and energy inefficiency (Lee and van de Meene 2013).

Pollutants generated from megacities with climate links include both long-lived greenhouse gases or climate forcers (LLCFs) and short-lived climate forcers (SLCFs) or pollutants (SLCPs). The first category includes substances such as carbon dioxide ($CO_2$), nitrous oxide ($N_2O$), and fluorinated gases, which stay in the atmosphere for long periods, with a warming effect (IPCC 2018). Black carbon, methane, and tropospheric (ground-level) ozone (e.g., smog) comprise the second category with greater regional variability and shorter atmospheric time spans. However for the short-lived substances quick actions for control particularly if carried out in combination with actions to control the long-lived substances, has significant potential to impact both the pace and degree of the climate threat. Thus short-term efforts to stem these substances are predicted to slow global warming 0.6 °C by 2050.

Even if emissions stay at 2005 levels, large urban areas are still the cause of one-fourth of total global warming since the preindustrial era (Folberth et al. 2015). UN Habitat points to the fact that urban areas are responsible for 60% of greenhouse gas emissions, directly linked to cities using just over three-quarters of the worlds energy (UN, "Climate Action," n.d). A large proportion (80%) of the total radiative forcing from megacities (e.g., system imbalances between sunlight the earth absorbs and energy returned to space) relates to carbon dioxide from fossil fuel combustion. This comes from various sources including automobile emissions, home heating, industry, and power generation. Methane, with a 10-year atmospheric life, is another major source of greenhouse gases generated in cities from sources including incomplete combustion of gasoline and natural gas, leaks from pipes transmitting natural gas, and landfill waste decomposition. Studies in sample cities find that even natural gas vehicles, often purchased or converted as a cleaner alternative to traditional fuels, are a source of urban methane emissions (Hu et al. 2018). While nitrous oxide is primarily generated from agriculture, urban releases occur from not only fertilized green areas but also fuels and automobile catalytic converters. Tropospheric ozone ($O_3$) is another short-lived greenhouses gas found primarily downwind from urban centers. Black carbon comes from sources such as diesel trucks, engines in industry, or traditional biomass cooking.

## Impacts of Urban Climate Change

Impacts of climate change in cities are varied, with changes projected to become more evident

after 2050 (McEvoy 2007). Watkins and Hunt (2011) pinpoint effects in urban areas including sea level rise and storm surge, impacts to infrastructure, health, energy use, and water with secondary effects on culture, tourism, urban biodiversity, and air pollution. Climate change also poses risks for vulnerable groups, particularly the poorest, the elderly, and those in informal settlements. Threats are also real for women, because of well-established intersections between climate, gender, and inequity (Pearse 2017). Just over three-quarters of cities across the world will experience a new climate reality by 2050, with one-quarter experiencing very different conditions.

Almost two-thirds of large cities lie in low elevation coastal zones. Thus 570 cities in low lying areas are projected for sea level increases of 0.5 m by 2050 which include 17 major cities with populations above five million (UCCRN 2018). This increases the likelihood of flood hazards due to storm surge and rising sea levels as a result of factors including deterioration of the Antarctic ice sheet (Garner et al. 2017; IPCC 2019). Increased flooding in a range of cities in recent years has touched towns along the east coast of South America such as Buenos Aires as well as 98% of the 654 largest cities in China (Magrin et al. 2014). Future flooding threatens large cities such as Jakarta, Mumbai, Hanoi, Alexandrea, New York, and Shanghai, with many cities in Asia accounting for a large proportion of those projected for sea level rise.

Ocean changes are projected even if desired warming and global greenhouse gas reduction goals below 2 °C are successfully met (IPCC 2019). Increased frequency of catastrophic events and extreme storms pose threats for both urban inhabitants and infrastructure. This includes not just systems related to transportation and energy but also those providing water, health, sanitation, and emergency services (Revi et al. 2014). Flooding and extreme precipitation impact not just mass transit but also surface sealing and drainage systems as well. Flood events pose financial risks for cities because higher impacted population densities result in elevated costs for restoring infastructure systems and ancillary costs such as insurance. Measures beyond building flood proofing include cost/benefit analysis, more careful planning, modeling and decision-making, installation of systems including seawalls and dykes, ecosystem restoration and green infrastructure, and other enhancements recommended from stormwater management plans (Eastern Research Group 2013). Community involvement in planning is a critical element of sound holistic reponse.

In some regions, climate change results in opposite problems of drought and water scarcity posing serious risks for urban areas. Latin America is one of the worlds most urbanized, with cities where droughts have increased urban rural migration or reduced informal worker income. Reduced snow melting and declining glaciers pose hazards for Lima, La Paz/El Alto, and Santiago. Cities such as Mexico City are turning to external water supply sources, and the IPCC warns that future shortages may hinder other municipalities across South America (Magrin et al. 2014).

Increased warming also exacerbates urban health challenges including heat stress resulting from heat waves. These risks sometimes reflect the urban heat island effect, the increased surface, and atmospheric temperatures observed because of extensive buildings, heating, and artificial ground cover. This increases death rates, particularly for vulnerable groups such as the elderly and urban poor (Van Steen et al. 2019) Efforts to identify temperature effect on older people have observed increased mortality on elderly in Paris and a 2.6% increase in mortality for every degree rise in temperature above 20 °C (68 F) in cities like Sao Paolo (Gouveia et al. 2003; Laaidi et al. 2012). Scenario modeling of 27 Chinese cities projects climate change heat impacts on these groups but notes potential to decrease deaths 18%, or 27,900 to 33,200 people annually, if climate change is limited to 1.5 °C versus 2 °C warming. Increased warming results in heightened reliance on air conditioning in urban areas that also increases release of $CO_2$ (Hacker and Holmes 2007). Poverty increases likelihood of not just lack of access to air conditioning, particularly in informal settlements, but also non-working or unused units because of cost. High

urban crime, often elevated in low-income neighborhoods, may influence reluctance to open windows. Women face risks because of longer life spans and economic fragility. Deaths sometimes occur when children, and occasionally the elderly, are left alone in closed, parked cars on very hot days. Evaporative coolers, fans, and design adaptations including green roofs are possible air conditioning alternatives to reduce emissions.

Climate change may exacerbate other health threats such as future levels of urban vector-borne disease. Interdependancies between cities and surrounding areas are important to consider since urban, rural, and suburban linkages relate to jobs, food, transportation, and water supply (Huston 2016). Thus climate change disruptions have rippling effects not only on the urban core but also suburban and rural communities. Control of greenhouse gas emissions has potential for other health benefits resulting from improvements in overall air quality. This is seen with temporary behavioral changes from the 2020 Covid 19 pandemic that reduced urban greenhouse gas emissions in some urban areas.

## Key Stakeholders

The crises of climate change in cities stimulated mobilization by a range of players at local, national, and international levels. In 2009, UN-Habitat, the UN Environment Program (UNEP), World Bank, and Cities Alliance launched a Joint Work Programme which included measurement protocols, tools for urban risk assessment, a knowledge center, and other strategies designed to guide cities efforts to combat the problem (United Nations "Climate Action" n.d.). By Huang et al. 2011 a C40 Large Cities Climate Leadership Group began. City mayors working through various networks launched a Compact of Mayors announced at the UN Climate Summit in 2014 in New York under the auspices of the head of the UN. This powerful symbol of city climate response involved support from key players such as the International Council of Local Environmental Initiatives (ICLEI), Michel Bloomberg, former Mayor of New York City, and Cities Alliance. This eventually became the Global Covenent of Mayors for Climate and Energy (GCoM) identified as the premier alliance on city climate involving more than 10,000 cities and local governments (Global Covenent of Mayors n.d.). The alliance launched tools aimed to support city innovation, research and technical capacity with Mayor's signing an agreement to join.

The Global Climate City Challenge (GCCC) initiative in 2018 stemmed from the GCoM working with the European Investment Bank. Key prioritized actions included a city-centered strategy to ensure shared prosperity, net-zero emissions, and alignment of national policy behind clean, compact, and connected cities. This involves financial support for sustainable urban infastructure, coordination for local climate action, planning for a just transition, and processes to build a multilateral system to foster cities which are both inclusive and zero carbon. In some countries, response to climate change within cities also strengthened bonds between national leaders and Mayors active on climate.

## Climate Change Planning and Policies

As a result of commitments to reduce emissions, effective systems for monitoring, verification and reporting (MRV) of emissions are key. Guidance for tracing greenhouse gas emissions is contained in a Global Protocol for Community-Scale Greenhouse Gas Emissions Inventories to increase the level of standardization in sector-specific city accounting and reporting (WRI, Institute C40, ICLEI 2014). The International Council for Local Environmental Initiatives (ICLEI) produced resources, handbooks, and operational protocols on climate assessment and planning to help cities design more comprehensive approaches of quantification and emissions reporting. Inventories of greenhouse gases are created for both city government activities and the city as a whole, which generates data feeding into city Climate Action and Adaptation Plans. Growth scenarios from planning departments combined with more detailed inventories of emissions, even at the

building and street level, is useful for targeting road segments and neighborhoods for emission mitigation.

Plans for government response to climate change at the city level take a variety of forms but generally include some combination of strategies, programs, laws. In Seoul for example, tackling the issue involved announcement in 2015 of the Promise of Seoul which included formalizing a vision and goals for various sectors including indicators and action plans (Seoul Metropolitan Government 2015). A clear set of actions by citizens, business, and government established changes required for achievement of goals in each sector. London announced intent to fulfill country signature of the Paris Climate Agreement through plans to make the city zero carbon city by 2050, built upon bottom up modeling (Greater London Authority 2018). By 2019 in the United States, approximately half of the largest cities announced climate plans. New York's One NYC 2050, for example, includes a commitment to carbon neutrality by 2050.

In Africa a range of cities including Dar es Salaam, Accra, Addis Ababa, Lagos, Dakar, as well as Cape Town, Durban, Tshwane, and Johannesburg in South Africa signed pledges to meet targets under the Paris Agreement including efforts to achieve zero emissions by 2050. Eleven pledged to complete plans. A number of Latin America cities in 2019, including Buenos Aires, Mexico City and Guadalajara, Lima, Medellin, Quito, as well as three cities in Brazil, Rio de Janeiro, Salvador, and Curitiba, pledged development of Climate Action Plans meeting Paris Agreement terms. Funding for planning through institutions such as the World Bank provides targeted assistance for small- and medium-sized cities that may have weaker planning capacity (World Bank 2014). City movement from pledges and plans to implementation involves overcoming hurdles including need for increased coordination, enforcement, monitoring, resources, and creative incentives to ensure follow through by a range of community actors. The Climate and Clean Air Coalition has mobilized attention to Short Lived Climate Pollutants, calling on cities to target these substances in plans for climate and sustainability because of potential benefits for air quality, health, energy, and food security.

## Cities and Climate Adaptation and Mitigation

Response by cities needs to be devoted to both adaptation, or making adjustments to cope with climate change as well as mitigation, that focuses on strategies to prevent or lessen causes of the climate problem. Adaptation strategies significantly reduce problems, for example, of those impacted by flooding and flood loss, some say as much as 2 to 3 orders of magnitude (IPCC 2019). Currently two-thirds of European cities have mitigation or adaptation plans (Heidrick and Recklen 2018). Some cities are limited in their ability to respond because of political, institutional, technical, and financial barriars and in many cities particularly in low-income countries, progress has been slow. Climate change is requiring new, more innovative forms of governance with greater attention and engagement through cross-sectoral strategies, new networks, and use of lessons from national, regional, and international arenas.

Adaptation measures vary between structural measures, such as infrastructure defenses, or non-structural approaches, such as urban residents changing behavior from awareness of climate risks (Birkmann et al. 2010). City mitigation strategies may be response to national climate plans or reflect localities moving despite national policy priorities. In the United States for example, just over one-fourth of cities adopted emission reduction targets as of 2019 (Sullivan 2019). Mitigation measures vary from mitigation plans and greenhouse gas inventories to greenhouse gas targets, carbon capture and storage, carbon emissions trading, or carbon taxes primarily on fossil fuels. While most activity is national or regional, examples of municipal carbon pricing include Tokyo's emissions trading, carbon taxes and fees in Singapore, the San Franciso Bay area, and Boulder, Colorado. There are advocacy efforts to increase local momentum.

Main targeted sectors for reducing city climate change emissions generally include building, energy, transport, waste, and industry, among others. These touch on improvements to public transport, more efficient use of energy (heating/cooling, lighting, and appliances), increased reliance on renewables or increasing transport choices (bikes, ferries, etc.), sustainable land use and development, and green preservation. In the industrial sector steps focus on making energy use more efficient while in the area of solid waste, recycling and reuse and capture of methane in landfills are part of the mix. Stable political support and financing sometimes remains challenging. Effective coordination is key because of intersecting issues under diverse municipal agencies including transportation, energy, environmental protection, planning, open space, housing, health, and solid waste to name a few. Some localities launched comprehensive low emissions development strategy programs through the Urban LEDS initiative starting in 2012 first with 37 and subsequently 60 cities. These include cities across Bangledesh, Brazil, Columbia, India, Indonesia, Lao PDR, South Africa, Rwanda, Italy, Finland, and Denmark.

Modeling tools and scenarios help assess potential costs and benefits of a range of measures with the regulatory framework setting the stage for choices made by individuals, businesses, and households. A number of cities are instituting policies impacting public or private buildings ranging from initiatives to increase trees or reduce pavement for stormwater management, requirements for reflective, white, vegetated roofing or reflective membranes, and bans on glass highrise construction. Individual behavioral changes reflecting understanding of climate impacts can be encouraged through public education. Increased telework due to the COVID 19 pandemic of 2020 is a useful test of widespread behavioral adaptations. Changes to building codes and regulations in cities worldwide will help address climate smart architecture. Aggressive response through land, transportation and solid waste planning, balancing land use and optimizing urban form, can also mitigate climate impacts.

## Climate Resilience and Cities

Work on development and disaster coalesced to place new emphasis on resilience, with the International Panel on Climate Change highlighting this concept in 2014, in terms of ability of a social-ecological system to not just cope with hazardous events but also reorganize through transformation and learning. Thus adaptation forms the foundation on which resilience is built. This theme was embraced in various city level initiatives. Since many of the worlds largest cities lie in Asia, the Asian Cities Climate Resilience Network (ACCCRN) launched with support from the Rockefeller Foundation provided millions between 2008 through 2016 to stimulate increased planning, implementation, and coordination for cities in the region. The initiative worked with cities in India, Thailand, Indonesia, Vietnam, the Phillipines, and Bangladesh. The 100 Resilient Cities Network expanded attention to the theme. City resilience strategies (CRSs) helped pinpoint climate change vulnerabilities and identify actions to address them. The project highlights linkages between good governance and achieving resilience goals through decentralization, autonomy in decision-making, transparency, stakeholder involvement in planning as well as flexibility and government reponsiveness. Administrative approaches which are more experimental and less top down or expert driven can be effective to cope with problems of climate risk. Cities also need to take proactive measures to build resilient infrastructure in all types of systems to reduce climate risk. Stakeholders including facilities and services such as hospitals need to engage in preparedness for extreme weather events including assessing operational vulnerabilites and formulating readiness plans as part of comprehensive reslience approaches (Loosemore et al. 2011).

A Cities Intergovernmental Planel on Climate Change Conference hosted by the IPCC and nine major partners including C40 Cities, Cities Alliance, Future Earth, ICLEI, the Sustainable Development Solutions Network (SDSN), United Cities and Local Governments (UCLG), the United Nations Environment Programme (UN Environment), UN-Habitat, and the World

Climate Research Programme (WCRP) was held in Canada in 2018. This brought together policymakers, scientists, and researchers resulting in launch of a Research and Action Agenda. This is projected to lead into the IPCC's Sixth Assessment Report (AR6), due in 2022 with a Special Report on Cities and Climate Change, expected for the IPCC's Seventh Assessment Report (AR7). The World Resources Institute developed a Urban Community Resilience Assessment (UCRA) tool to aid planning and measurement of climate resiliance needs. Grassroots women's organizations also mobilized local communities through participation in the Huairou Commission's global networks Climate Resiliance Fund. This stimulated activities including local to local dialogues and community mapping to empower women to have a more active voice in work with local governments (Huairou Commission 2016). Expenditures for climate resilience in cities are still relatively low, although it varies greatly among megacities. Georgeson et al. (2016) found allocations below one quarter of 1% of GDP in cities in the developed world. In the developed world investments in water and energy were prioritized, with New York city spending the most in total dollars. In the developing world, allocations for health and agriculture were dominant, with Beijing's expenditures of one-third of 1% of GDP on resilience and adaptation, far higher than other cities. Significant future investment in low emission, climate resilient infrastructure is key, with new concerns emerging around the Covid 19 pandemics impact on expenditure delays for climate resilience projects.

## Cities in Action: Two Case Studies

With over 5.7 million people in 2020, Johannesburg, South Africa, is a city in a developing country with an economy heavily invested in minerals and energy. At the heart of regional commerce, this city was one of Africas largest greenhouse gas emitters due to factors such as electricity generation and industrialization. With population growth at nearly 3% annually, Greater Johannesburg embraces smaller communities such as Soweto, with wide social and economic disparities. As the first city in Africa to join C40, engagement in the process helped stimulate city leaderships focus on climate. The Environment and Infrastructure Services Department plays a central role in climate change policy. Although the city is sheltered because it is not coastal, climate risks include increasing floods, heat waves, and disease vectors. By 2007 the city began announcing some efforts toward response including energy-efficient building design guidelines, projects on tree planting, solar street lighting, solar water heating installation in low-income housing, and landfill gas to energy projects (Mokwena 2009). By 2009, the cities Climate Adaptation Plan was launched with a climate strategy in 2012. Six years later a $140 million Green Bond was signed to finance climate adaptation and mitigation. Soon the city was increasing efforts to reduce carbon emissions, moving forward larger instructure projects relevant to climate change with continued challenges in data gathering, reporting, and interagency collaboration (Hickman and Stehle 2017). The cities Growth and Development Strategy 2040 articulates a goal of a resilient, adaptive, sustainable city, with the Energy and Climate Change Strategy and Action Plan committing to lowering greenhouse gas emissions 43% by midcentury, which was expanded upward in the 2015 Climate Change Strategic Framework's to a range of 40% to 65% by 2040 because of the Compact of Mayors (Ecometrix 2015). In recent years green bonds financing is helping with smart meters, solar water heaters, purchase of hybrid buses, and bus conversion from diesel to biogas. Landfill methane emissions converted to clean energy and biogas helps supply electricity to the water treatment plant (Smartcity 2019). A new Johannesburg Climate Action Plan (CAP) is in the works for 2020 and national carbon tax instituted in 2019.

New York City, the largest in the United States, has over 8.3 million in a metropolitan area of 18 million. Attention to climate change emerged around 2008, with impetus from the multidisciplinary New York City Panel on Climate Change (NPCC) that recently released climate projections (Choo 2019). Devastation during 2012 Superstorm Sandy focused attention on

vulnerability of the 520 mile long coastline. The **Mayor's Office of Climate Policy and Programs, including the** Office of Resiliency, **plays a lead role** overseeing One NYC 2050 (Werner 2015). This well-funded strategic plan replaced the previous Bloomberg administrations PlaNYC, embracing plans for climate change. Former Mayor Michel Bloomberg, through his philanthropies, also played a lead role in global city mobilization on climate change through the C40 network.

Varied New York City climate change actions include voluntary building design guidelines, work on special floodplain zoning rules, and plans to floodproof lower Manhattan through coastline extension. The NYC Cool Roofs lightens roofs to deflect heat and legislation requires green roofs on new residential and commercial buldings. Tree planting surpassed other global cities through tree giveaways, the MillionTreesNYC program in 2007 and more recent Cool Neighborhoods program. City biking expansion, subway system hardening of flooding defenses, and rollout of city bus electrification are occurring. The Climate Mobilization Act requires buildings over a certain size to lower emissions with city pension funding divestiture from fossil fuels targeted for 2023. A Green Infastructure Program targets stormwater control, while heat island efforts included home health aide training and monitoring vulnerable during heat waves. Signs of progress include emissions declines of 17% by 2017 from 2005 levels (New York City Mayors Office of Sustainability 2020).

## Conclusion

Management of response to climate change is critically important for the well-being of populations in cities worldwide. Effective governance necessitates not only creative thinking but also forceful, proactive strategies to address the scope of the threat. Attention to climate change has grown at the local level, with increased media coverage and public awareness in urban communities across the globe. At the same time the narrow window for action demands rapid mobilization to meet the pressing challenge impacting the globe. Effective planning and communication, enhanced coordination, understanding of risk management, institutional capacity building, and improved collection of relevant data, along with significant resources and financing must all play a part. These will help address both adaptation, recovery, and mitigation to adequately prepare for future climate threats. Thus it is urgent to strike the right balance between a sense of crises and positive messaging that cities worldwide can grow and prosper, with capabilities to manage the climate threat.

## Synonyms

Citizen journalism; Complimentary journalism; Crisis management; Pseudo journalism; Xenophobia

## Definitions

Unedited content: A news story which has not passed through any checkpoint for editing but disseminated for consumption.

Fake news: Disseminated information which has been falsified or doctored to serve an interest.

Crisis management: The reporting of social issues by citizen journalists in such a way that heightens tension among the masses.

Complimentary journalism: A kind of journalism done by ordinary citizens that performs functional and dysfunctional roles alongside professional journalism.

## Introduction

All over the world, citizen journalism and fake news are inseparable. Citizen journalism refers to "a citizen playing an active role in the process of collecting, reporting, analyzing and disseminating news and information." This is the practice of journalism by people who have no journalistic experience. Being the news of the people by the people and for the people, citizen journalism has been given such names as "public journalism,"

"participatory journalism," "democratic journalism," "guerilla journalism," and "street journalism" (Banda 2011). Writing on the power and perils of independent reporting, Rogers (2019) observes that citizen journalism brings private individuals performing the same tasks that trained reporters perform. It can take many forms: from a podcast editorial to a report including text, pictures, audio, and video. A general problem is that citizen journalism has been marred by non-fact-checked, inaccurate reportage like the political reports that further divide Americans in the present harmful political culture.

This type of journalism by ordinary individuals is made possible by the emergence of new media like computer, software, and the Internet which enable them to share their creations, arguments, dispositions, and criticisms. These, they disseminate on available media outlets. The notion behind CJ is that anyone with something to say and access to the right software can be a publisher, a pundit and observer of events great or small (Allan 2006). Like professional journalists, citizen journalists seek to promote a better society by presenting and speaking truth to power. To these untrained individuals, the job they do is a cell of social responsibility because they actually become a third eye of observation in today's world. Lending credence to this, Seungahn et al. (2017) observe that CJ provides alternative perspective of events which the mainstream media may not have covered. Thus, it could be said that CJ competes with and is also complimentary to professional journalism. In essence, CJ is viewed as civic participation. The rapid growth of blogs, following the successful launching of the web in the 1990s, has aided the passive audience to take up active roles as participants in citizen journalism.

It is necessary to point out that while CJ is carried out by the unprofessional, the functions it carries out in the society cannot be denied. Notably in this era of globalization, CJ influences the speed and nature of information dissemination across the globe. The new media, powered by the Internet, does not assume the extinction of the old media but evolves and adapts to dynamic media environment which brings about improved and easier ways of managing communication tasks.

Being a phenomenon that has some dysfunctions to both the individual, groups, and the society at large, citizen journalism has heightened the craze of unethical practices (where anyone just writes and sends information on the web without gatekeeping), thereby threatening the truthfulness and dignity of journalism as a profession. The digital media has enabled user-generated contents, video journalists and bloggers, social networking sites, and massively, multiplayer online games. Today, the technological devices available have aided CJ by affording citizen journalists the opportunity to type their stories on computers and/or word processors. As an advantage, the use of computers with autoediting devices helps citizen journalists to edit their contents in terms of spellings and grammar error on the spot. The modern technology also aids storage of information and citizen generated contents.

## Origins

Looking at the development of CJ, Saqib (2011) observes that the historical development is associated with dissemination and utilization of web publishing software. In the view of Flew (2008), the prime inauguration of CJ was in 1999 following the development of open publishing architecture by Matthew Arnison and other persons who were part of the "Active Sydney group." In the same year, they adopted the open source models such as the independent media center-Indymedia, which facilitated the modern form of news production. In the year 2000, Ohmy News. Com, a Korean website launched by a veteran journalist, Oh Yeon-Ho, stated the incompetence of Korea's conservative traditional media.

Darnton (2017,1) observes that fake news or pseudo-journalism shows a long history of misinformation.

> Procopius the Byzantine historian of the sixth century (Emesa, page 51) churned out dubious information, known as Anecdota, . . ..in order to smear

> the reputation of Justinian after lionizing the emperor in his official histories. Pietro tried to manipulate the pontifical election of 1522 by writing wicked sonnets about all the candidates. . . and pasting them for the public to admire. . .

The pasting of these wicked and character assassinating sonnets was at the Pasquino near the Piazza Navona in Rome, which later developed into a popular genre of disseminating nasty and fake news about public figure, hence, pseudo or quasi-journalism. Of mention also is the Canard, a form of fake journalism hawked in the streets of Paris in the seventeenth century. Such Canards were printed broadsides often engraved with designs to appeal to the credulous. The author under review also points out that historically, the production of fake news, semi-false and true but compromising snippets of news, got to the climax in the eighteenth century London with the circulation of newspapers among a larger public. In 1788 in London, paragraph men (journalists) who must beat deadlines to submit news stories to editors picked gossips from coffeehouses and wrote few sentences on them, turning to same printer-publishers for publication. Some of these paragraphs were financially induced and they contented themselves with the manipulation of public opinion in support of or against a public figure, a play, or a book.

Looking at Fake News/PJ as a phenomenon which did not start today, Darnton (2017) clarifies that Rev. Henry Bate, the Chaplain of lord Lyttleton in 1772, established the Morning Post whose contents were paragraphs made up of fake news and pseudo-journalism. The report on December 13, 1784, of a Gigolo serving Marie Antoinette, perhaps, stands out as an element of pseudo-journalism of the Morning Post. Today, scholars (Oberiri 2016; Wendling 2018 and WestMonday 2017) have noted that the practice is highly empowered by the emergence of information and communication technologies, particularly by the use Smart phones. Darnton (2017, 79) observes, "I have found some examples of this incriminating evidence in the Bastille archives-crumpled scraps of paper covered with scribbling testimony to a primitive variety of Journalism two centuries before smart phones. . . just today, in the case of the fake news about supposed orgies involving Hilary Clinton."

Pseudo-journalism (PJ) is another way of saying fake News (FN). So, PJ is synonymous with quasi-journalism, a form of journalistic practice that falls short of the standard thing. It is deficient of the necessary ingredients or components of professional journalism. Shikigami (2016) notes that pseudo-journalism has gained ground in the USA as the mainstream media, maintaining that any news that does not support the government is considered irrational, and then is suppressed.

Gamela (2015,1) unequivocally states that pseudo-journalism is "an elaborate expression that is equivalent to propaganda . . . always serving someone's purpose. . . never in society's best interest." In this explanation, PJ means you write what you are told to write, not necessarily what you want to write or the exact thing that has taken place. Conceptualizing CJ, it is understood from the aforesaid that it is the practice of journalism that is not straight. It is a colored and biased report or event of a report that is not real. It never happened. Pseudo journalism is partisan, thus favoring one party. It can be about pseudo-science. It can feature a kind of politician or just the fluff piece that elicits more attention and space over true news. . . Pseudo-journalism tilts the audience's perception on what is really important for them.

Since pseudo-journalism serves an interest, it is manipulative and, just like propaganda, aims at swaying opinion and influencing the masses. PJ is fake news. Caroll (2004) opines that there is no entrance examination taken before one gets into the journalism profession as it is the case with doctors, lawyers, and so on. There are no licenses, no governing board to discipline them when they err. As a result, it becomes the constitutional right of every citizen, no matter the naivety or depravity, to practice journalism. Caroll (2004.1) points out that "Even before it was discovered that the young reporter Jayson Blair had fabricated several dozen stories, the news staff of the times was

unhappy . . . the staff learned that the paper had repeatedly misled its readers. . . because the readers had been betrayed . . . the Blair scandal was a terrible event. . ..” Gans (1980) explains that a news story that lacks objectivity is also strained of values and shows disregard for social implication and outright rejection of ideology. These features are, to all intent and purposes, depictive of pseudo-journalism.

Pseudo-journalism did not start today. A historical overview reveals a lot of this fact. In the Holy Scripture is the Biblical account of Adam and Eve in the garden of Eden (Gen. 3:1-15). God had instructed Adam, “you shall not eat of the forbidden fruit, for the day you eat of it, you shall surely die”(vs 17 of chapter 2). In the preceding chapter where the serpent conversed with Eve, the serpent asked Eve, “did God really say that you should not eat of every tree of the garden?”

Eve replied “. . . God has said, you shall not eat of it, ***neither shall you touch it***, lest you die” (Gen. 3:3). In this report by Eve, there is an alteration and distortion of the original instruction. The original instruction did not have the attachment, “***neither shall you touch it***.” How then did that idea come about and what was the purpose in the context? In news reporting, truth and objectivity remain problematic.

## Citizen Journalism as Pseudo-journalism: Cases from Nigeria

Both in the mainstream and free journalism in Nigeria, fake news thrive. Emphasis here is on pseudo-journalism through the social media and other smart devices powered by the Internet. The veracity of the news items flooding the social media, particularly Facebook and Whatsapp, is still problematic. A lot of issues from politics to religion down to other issues of serious social significance have been manipulated by citizen journalists through the new media to produce fake news.

There is no doubt the farmers-herdsmen clashes in Nigeria have significantly been fuelled by fake news BBC Africa (2018). This report by BBC Africa explains that such fake reports that cause ethnic and religious divides are facilitated by the social media. In the media, fake pictures are used to authenticate reports of intercommunal violence, hence, tension is inflamed. During the recent Plateau crises, a horrible war video with casualties was shown as a scene from the Jos crises. Meanwhile, the same video was circulated as a scene from the Ebonyi-Cross River states crises.

The Guardian Newspaper (2018) reported the use of a gruesome picture of a woman, whose face was dipped in a pool of blood, to be from the Jos attack. However, the Guardian clarified that the same image was shown in 2011 in another crisis. Now, it has several hundreds of tweets on twitter. Seeing the Guardian analysis, another image of six dead persons in an attack was shown. But a close examination reveals that the picture was not even taken in Nigeria. It was discovered to be a traffic accident in Dominican Republic in 2005. Such posts were too real to be doubted, and they also generated highly inflammatory comments and reactions. Which one does one believe?

In the recent past, Danladi Ciroma, leader of the Miyetti Allah Cattle Breeders Association, circulated a statement attributed to him by a major Nigerian news outlet. The media organization has also tendered an apology. The purported statement reads: “The attacks in plateau were revenge for the loss of 300 cows. Since these cows were not found, no one should expect peace in the areas.”

BBC notes that these reports are unverifiable and have further worsened the crises in Nigeria. Other issues or headlines that have been criticized as fake news promoted by citizen journalism include: Withdrawal of Police Special Forces from Benue, Presidency Faults Report on Withdrawal of Police Forces from Benue, and God Told Me to Marry My Sister, among others.

Bemoaning the excess of fake news through citizen journalists in Nigeria, Umahi (2017) has called on the Nigerian government to rise up to it. On the ongoing agitations by the Independent People of Biafra, the Ebonyi state Governor also claims misquoted. The Governor speaks:

> First, I was falsely reported. What we said was that we stand for unity of our great country, Nigeria. . . if I were the president of this country, I will do something about the social media. I think it's destroying our country. . . I think everyone needs to account for whatever he or she writes

In Nigeria, "Fake News has reached an epidemic proportion and social media, particularly, Facebook, appear to be the most efficient purveyors" (Foluso 2018, 1). Giving credence to the report by BBC that fake news has aggravated the farmer-Fulani herdsmen conflict in Nigeria, attention here is drawn to the bloody picture of a dead five-year-old school boy with wide matchet cuts all over his head and neck, claimed to have been a victim of the Fulani herdsmen attack in Ogun State. As it circulated with several sympathetic comments causing traffic on the social media, particularly as he was supposed to have been gruesomely murdered, another report emerged that he was actually killed by a mad man, not the herdsmen. Which of these reports is true?

In the recent past political heat in Nigeria, the IGP Ibrahim Idris has denied sending his men to besiege the National Assembly while men of the police force were really seen there in the social media. In an earlier video, the same IGP was shown on social video unable to read a written speech. The video went viral, but IGP denied the stammering video and claimed that it was doctored. Who is telling the truth? (Premium Times, August 24, 2018, 22).

## Citizen Journalism and South Africa Xenophobia

The management of crisis by social media at all times has been questionable (Ekwunife 2019). Such unconventional media is awash with doctored contents, misinformation, outright fake news, and the superimposition of images from different contexts to unrelated situations (BBC Africa 2018).

Attacks against foreigners in South Africa are not new, having been recorded about twenty five years ago (1994 to be precise). The difference is that in this age, social media makes information travel very quickly while fake news has added fuel to the fire. In the recent xenophobia in South Africa, so many images, videos, and footages were generating traffic on social media causing untold tensions in the society. Whatsapp is replete with the video of a three-storey building set ablaze with persons jumping or falling from the floors. BBC Africa (2018) clarifies that the violence actually took place in the city of Surat in western India in May 2019. In circulation also is the footage of a man being burnt alive for robbing a woman of her handbag in South Africa. This incident actually happened in Johannesburg, South Africa, but in a different crisis that erupted in January 2019.

Speaking on the above incident, Yemisi of BBC Africa (2018) explains that "the social media is awash with graphic photos and videos that stroke tensions and uncertainty in the country," leading to the receivers of these information unable to tell what is real or unreal. Here, it is necessary to point out that many of the footages shared on social media about the xenophobia in south Africa are not fake or doctored but from different contexts aside the current xenophobia (BBC Africa 2018). The video of South African Deputy Minister of Police was circulated on social media speaking about the presence of foreign nationals in South Africa, but the video is actually a clip from 2017.

The popular Nigerian blogger Linda Ikeji shared a photo of the burned MTN office set alight in Lagos. A close observation reveals that it is the picture of another fire incident from another state in 2005.

## Conclusion: Citizen Journalism in Nigeria

Concentrating on the dysfunctions of citizen journalism as mainly the purveyor of fake news in Nigeria, the flood of unverified contents in the social media, particularly Facebook and Whatsapp, has aggravated political, religious, ethnic, and other crises in the society. The management of the xenophobia in South Africa by citizen journalists has also shown reports that flamed up an already bad situation. Considering the absence

of gatekeeping and fact checking in CJ, it is seen as quasi-journalism and unprofessional.

# Citizen Mistreatment May Hurt Public Service Worker's Feeling

Hyun Jung Lee
Department of Public Administration, MyongJi University, Seoul, South Korea

## Synonyms

Citizen mistreatment; Emotional labor; Korean government; Public sector reforms; Public service

## Definition

Citizen mistreatment towards public service workers include yelling at public service workers, unreasonable criticism to public service workers, and/or inappropriate comments or behave to public service workers. This occurs when citizens perceive services are not met with their expectation.

## Introduction

Public sector reforms brought significant changes to government attitudes. For instance, from hierarchy to "heterarchy" (Guy et al. 2019, p. 3), process-focused to outcome-focused, closed-internal system to openness and transparency system, and a government-centered to a citizen-centered. These reforms mostly revive in the public services where they frequently interact with citizens, which requires emotional labor, refers to managing one's own emotion to comply with organizational display rules while interacting with customers/citizens. Therefore, public service

employees not only fulfill citizens' expectation but also understand citizens' emotional states to meet their job duty. In other words, public services have implemented the effective and efficient ways of producing outcomes to attentive and responsive to the needs of their citizens. Regrettably, these notion of citizen-oriented reforms gradually alter citizen attitudes, such as placing public service workers in the position of relatively lower power than citizens, where they often mistreat public service workers. Citizens' aggressive and disrespect behaviors can be detrimental to well-beings of public service workers.

South Korea (hereafter, Korea) has traditionally been known as "the courteous country in the East," meaning the Korean people prioritize politeness above other values (The Korea Herald 2019). However, service industry reveals a different image of the country, as a customer perceives as a king and a service provider (or a seller) perceives as a servant. This top-down relationship also extends to the Korean public services where the Koreans perceive that public employees are as "hippos that take all the taxes from us" (a common Korean idiom) that citizens believe that they have a right to receive better public service (Lee 2019). Such perceptions have been a long-standing social norm, because customers/citizens are the one who pay for services/taxes and thus, service providers must show great respect to the customers/citizens to please their expectation (Lee 2019). More problem is that public service organizations connect government and its people, creating an environment which place citizens in the relatively higher position than public service workers, causing customer mistreatment. Consequently, Korean public service employees encounter more challenges when facing aggressive citizens.

## Background of Public Service in Korea

Traditionally, Korean government employees have had significant power over citizen, which highly influenced by *yangbang* tradition. *Yangbang* were educated class who were literate members of society and also eligible to enter government agencies in old days. Because only those people who passed the civil service entrance examinations become civil servants, it was clear that the *yangbang* monopolized the examinations which led to high social status (Kim 2010). Therefore, for the *yangbang*, to pass the civil service examinations were the prime way of leading success as well as gaining social status. These examinations were very comparative which tested variety of subjects, including Chinese characters, history, poetry, Confucianism, et al.

The early civil entrance examinations later changed to competitive examinations which created the system of civil service to a career system and guaranteed life-tenure position until the age of 65. Consequently, many younger generations put great effort to pass the entrance examinations and as a result, the number of applicants who attempt to take the examinations increase every year. As of December 31, 2019, there are over one million public servants in South Korea, of whom 681,000 are national public officials and 407,000 are local officials, not including armed forces personnel. Likewise, the public servants in Korea still receive a social prestige and enjoy some degree of authority over citizens.

As mentioned above, government jobs have represented a prestige social status in Korea society and that most Korean government employees are not accustomed to worry about whether they treat people with good manners (Lee 2018). However, citizen-oriented performance has placed new and additional pressure, besides job-demand from supervisors on government employees, especially those who interact actively with citizens (e.g., public service workers), which is the performance appraisal on customer-orientation abilities (e.g., citizen feedback, service manner, etc) became one of the crucial factors, causing emotional stress. However, there are inadequate public management systems, including providing regular training, which can help Korean public service workers how to interact with citizens in the emotive demands situation.

The structure of the Korean civil service is arranged in a nine-tiered system from Grade 9 (basic entry-level and the lowest in the career civil service) to Grade 1 (assistant minister level and the highest in the career civil service), and the

civil service entrance examinations are provided for Grade 9, Grade 7, and Grade 5 positions. Generally, those employees in Grade 9 perform emotional labor whose jobs involve interacting daily with citizens seeking administrative services (e.g., issuing and managing official documents). Consequently, public service employees who work at administrative services typically require enduring the complaints of people along with other possible stressors (e.g., a number of citizens they need to serve a day, and/or a pressure from supervisors to be humble regardless of customers' behavior) and are likely to experience citizen mistreatment, which will cause, in the long run, psychological strain.

## Citizen Mistreatment in Korea

Citizen-oriented reforms gradually alter citizen attitudes, such as placing public service workers in the position of relatively lower power than citizens, where they often purposely mistreat service providers (Sliter et al. 2010; Hecker 2005). In general, Korean people have a tendency to treat government employees more disrespectfully than respectfully nowadays. Many people perceive that public employees are as "hippos that take all the taxes from us" (a common Korean idiom) that citizens believe that they have a right to receive better public service (Lee 2019). These perceptions put citizens in the position of higher power and as a result, citizens' behavior can be aggressive when services are not met with their expectation.

The shocking incident happened in Korea, in 2018, where a citizen shot two public service employees because he was not satisfied with the way public service employees dealt with civil complaints. After this incident, the Ministry of the Interior and Safety in Korea created the manual called "Manual for civil complaint" to protect public service employees from citizens' mistreatment. However, in reality, Korean public service employees rarely use this manual, because of the following two reasons: (1) Korean public service employees aware that the aim of their work as public servants is to serve all citizens with a good manner and thus, suppressing and tolerating citizens' complaints consider as an organizational norm. In other words, altruism is required to all public service employees regardless of situations. (2) Korea is collectivist country where people tend to prioritize group over personal interests and thus, public service employees are more likely to use indirect or passive coping strategies to avoid interpersonal conflicts in workplace. However, when there are high job demands with less social/organizational supports and/or controlled coping strategies, employees may exceed their resistance to stress, yielding burnout and decreasing service quality.

Experiencing citizen mistreatments, such as verbally abused or rude behavior, puts public service employees in a difficult situation (e.g., suppressing negative emotion and merely enduring the situation for their job role). According to the Minister of Interior and Safety in Korea, citizen abusive behaviors toward public service employees have been increased since 2017 from 92 cases to 143 cases in 2018, and the total number of citizen mistreatments, including verbally and physically abuse and repetitive complaints, reveal more than 30,000 cases in 2019. The study done by Hsieh (2019) on citizen mistreatment toward public service workers reported that among seven countries, that are China, Pakistan, Rwanda, Korea, Taiwan, UK, and USA, Korean citizens mistreat the most toward public service employees. Further, all respondents except Rwanda, reported that citizen mistreatments reduce public service workers' job satisfaction and distrust in citizen. Enduring citizen mistreatment is emotional provoking event which requires a high degree of emotional regulation, causing emotional exhaustion, absenteeism, and poor performance, as well as reducing service providers' self-esteem and sense of self-worth (Shao and Skarlicki 2014; Sliter et al. 2010; Dormann and Zapf 2004). Moreover, facing such difficult situations without taking any action against the citizens makes Korean public service employees overly express prescribed emotion not to show their negative emotion.

## Effects of Citizen Mistreatment

Although customers' mistreatment is unintentional, a number of studies have shown that it can significantly lower service employees' self-esteem and sense of self-worth harm workers' well-being (Burton and Hoobler 2006; Dormann and Zapf 2004; Shao and Skarlicki 2014). Unlike private service sectors where making profit is priority of their goals, public service sectors demand more emotional labor because public service employees' expressed emotions leave lasting impressions on citizens, which also lead to perceptions of service quality and attitudes toward government (Lee 2018). As a result, public service employees must endure suppressing negative emotion to build a good relationship with citizens. Frequent interaction with citizens encounters more emotionally difficult than one might anticipate, because citizens want to be treated with respect, they want fairness in terms of uniform standards, and they expect high customer service standards to be met (Rayner and Lawton 2018), which require well-job performance, including emotionally and rationally. Otherwise, citizens treat public service workers in demeaning and impolite ways, which might cause stress and burnout.

A number of recent studies in the private services have shown that customer mistreatment is positively related with workers' customer directed sabotage, referring to workers intend to harm customers by creating delays in service process, destructing the customer-employee relation, purposely hanging up the phone and transferring the customer to the wrong department (Shao and Skarlicki 2014; Wang et al. 2011). However, workers' sabotage can hardly found in the public service sectors. With the lack of options to confront the misbehaved citizens, an authentic way of delivering service is challenging for public service employees. For example, when public service employees perceive that a citizen treats them disrespectfully, they suppress anger to comply with their job duty and try to complete a transaction as quickly as possible to end the uncivil interaction provision (Sliter et al. 2010). Interacting with misbehaved citizens need some time to recover from the experience, which can affect service quality across the next several citizens, and this, in turn, leads to exhausted (Hobfoll 2002). Nevertheless, public service employees have civic-minded, dealing with aggressive citizens due to unmet service needs can cause personal failure, job dissatisfaction, and emotionally exhausted (Hsieh 2019). Consequently, there is a high chance that public service employees may not provide a good customer service as a negative action shall bring another negative one (Hsieh 2019).

In addition, institutional and organizational deficiencies, for instance, make public service employees in a difficult situation. When public service employees face citizens who desperately need public assistance but there are limited resources to use, citizens not only blame for resource inadequacy but public service employees' inability to offer an adequate service. When citizens perceive that public service employees are ill-prepared to cope with structural deficiencies, people show high-intensity behaviors, such as yelling to public service employees, until resources are available.

## Conclusion

Recently, Korean governments tried to protect public service workers from citizens' mistreatment by implementing the following two policies. First, in 2018, Industrial Safety and Health Act was enacted to protect emotional labor workers who are suffering from physical and mental pain. Second, The Ministry of Employment and Labor published manual called, The Handbook for Emotional Workers Health Protection, in 2017 which included customer service manual, displaying a message asking people not to do any act that might cause stress and allowing more work autonomy. However, many Korean public service employees do not refer to this manual when facing aggressive citizens, because they value relationships with people and harmony at work (Lee 2018), meaning they suppress their anger or frustration, which, in long run, can cause harmful outcomes. Consequently, to lessen the citizen

mistreatment, not only organizational support but social support are necessary, especially Korean citizens' perceptions toward public service workers urgently need to change.

# Citizen Participation and Nonprofit Organizations

Elizabeth M. Gillespie
University of Nebraska Omaha, Omaha, NE, USA

## Synonyms

Citizen engagement; Citizen involvement; Voluntary association

## Definition

Citizen participation: a process in which individuals engage with institutions and with their environments to have a voice in making decisions about issues concerning their lives.

## Introduction

In democratic societies, the concept of citizenship encompasses a notion of having certain rights. One of those rights includes the right to engage in the political sphere to be heard and have a say in the decisions and issues that affect the lives of citizens. A method citizens use to engage in the political sphere is through participation in nonprofit organizations. Citizen participation in nonprofit organizations is a long-held tradition in societies across the globe, from grassroots organizations to national and international nonprofit organizations and spanning across different social, cultural, and political backgrounds. Participation in nonprofit organizations empowers citizens, acts as a mechanism for citizens to build democratic knowledge and skills, and is a means for citizens to express their needs, values, and wishes. In modern democracies, citizen participation generally takes the form of philanthropic actions such as volunteering one's time and making financial donations. It also takes the form of

membership in voluntary associations. When citizens volunteer their time, give money to nonprofits, or are members in a local voluntary association, they are communicating their interests through organizations that work on and advocate for the causes citizens deem important. Often the causes supported by nonprofit organizations affect and benefit a wider population as many nonprofits aim to produce social change and help solve societal problems. The degree to which volunteering, charitable donations, and membership occur, however, depends on the type of organization and organizational structure of the nonprofit.

The purpose of this entry is to look at volunteerism, charitable donations, and membership in voluntary associations as methods of citizen participation in nonprofit organizations. To explore the principles and methods of citizen participation, this entry first examines the political context related to citizens participating in nonprofit organizations. Next, the three methods of participation – volunteerism, charitable donations, and associational membership – are discussed. The last section overviews the benefits of and barriers to citizen participation. This entry ends with concluding remarks that summarize this entry.

## Political Context

There is no universally agreed upon definition for citizen participation. One way to define it is as a process in which people engage with institutions, either locally, nationally, or internationally. This engagement offers citizens a chance at having a voice in the decisions being made about the issues that affect their lives. Dating back to ancient Greek philosophy is a notion that governments should be attentive to the needs and wishes of citizens and that citizenship involves a commitment to society's overall wellbeing. Based on this concept, citizen participation in nonprofit organizations is both a right and an innate practice. Rousseau and Mills relate these principles of citizenship to the strengthening of democratic societies arguing that citizenship in a democracy is a learned concept that occurs and is strengthened through continued practice (Roberts 2004). In democratic societies, citizen participation in nonprofit organizations is representative of democratic values, helps develop knowledge in citizens, fosters citizen empowerment, strengthens community ties, and creates social change.

Principles of citizen participation are found in theories of direct citizenship, which portray citizens as active players in the institutions that make decisions and formulate policy. Citizens and administrators in a democracy work together through various organizations with the shared purpose of improving services and solving social issues. This type of collaboration generally takes place at the local level between citizens and organizations helping to build up communities and sustain a democratic government. There are examples of direct citizen participation in nonprofit organizations throughout democratic societies, and it is expected to grow as democratic societies collaborate in working to solve difficult social issues. Additionally, the direct involvement of citizens in the institutions of a society fosters an environment where institutions are more receptive to taking action on behalf of individuals and communities so that their needs are better met.

The study of citizen participation in nonprofit organizations in the USA originates with Alexis de Tocqueville in his work, *Democracy in America*, penned in the 1830s. Tocqueville reported on the important and powerful place voluntary associations held in fostering civic engagement, and democratic and egalitarian virtues. These associations functioned as a place where citizens joined together to effectively solve problems plaguing society (de Tocqueville 2003). Throughout American history, voluntary associations allowed citizens to engage with each other and there is a long history of using organizations to influence legislators towards a specific cause, including grassroots social movements and social change organizations. The contemporary nonprofit sector has become a domain for citizens to effectively pursue shared goals.

Lastly, the methods of citizen participation in nonprofit organizations have direct ties to the values and practices of philanthropy. The original Greek description of philanthropy was "love for humankind" (Bernholz et al. 2016). One way to define philanthropy today is as an act of making voluntary donations of money and time to produce social change that benefits society. Some consider philanthropy as a deed citizens carry out, meaning an action whereby citizen volunteer time and/or money to nonprofit organizations and that some public benefit has to come about as a result of that act. Philanthropy has been an aspect in democratic societies throughout history and throughout the world. It occurs through people offering support to organizations, which has many positive consequences for citizens and communities.

## Methods of Citizen Participation in Nonprofit Organizations

Worldwide, roughly one in three people gave money to charities, one in four volunteered their time in 2015 (CAF 2015), and millions of citizens are members of voluntary associations. These three activities are representative of the principles of citizen participation in nonprofit organizations. A primary reason volunteering and donating money to nonprofits reflects principles of citizen participation is that these activities help to communicate the needs and wishes of citizens to government and enables nonprofits to continue to carry out their work in advocacy, social services, and creating social change. By dedicating time and money to nonprofit organizations working on causes important to citizens, citizens exercise some form of political influence. Lastly, engaging in voluntary institutions through membership offers opportunities for citizens to gain knowledge about their communities and fellow citizens' needs as well as gain democratic skills. This section first discusses volunteerism, then charitable donations, followed by membership in voluntary associations.

### Volunteerism

Volunteerism is something that nonprofit organizations around the world have in common as they depend on volunteers to support, sustain, and advance their organization's cause. Nearly two-fifths of all charities rely on volunteers. A total of 62.8 million adults volunteered at least once in 2014 in the USA. Since 2002, Americans have volunteered a total of 8.7 billion hours (McKeever 2015). Globally citizens from diverse cultures and backgrounds volunteer their time as well. According to the World Giving Index (2015), Myamar ranked first as the most giving country in terms of time volunteered with 50% of those surveyed having had volunteered in the previous month. Sri Lanka came in second at 48%, followed by New Zealand at 45% and then USA and Canada tying for fourth at 44%, to round out the top five countries for volunteering time to charitable organizations.

There are various motivations for volunteering in nonprofit organizations, including demographic factors. Some important factors include the amount of time spent in a community and whether the person has a belief that she/he will receive some benefit for having volunteered one's time. Furthermore, there are numerous types of nonprofit organizations that receive the aid of volunteers such as religious charities and community development organizations (Florin et al. 2000). As far as activities go, in 2014, the most hours volunteered in the USA were directed at social service and care activities at 23.8% and administrative and support activities at 23.5% of total volunteered time. Social service and care activities cover many undertakings such as delivering goods, providing direct services, and teaching or mentoring. The time volunteers spent in 2014 was worth an estimated $179.2 billion (McKeever 2015).

### Financial Donation

A second form of citizen participation is financial/charitable donations to nonprofit organizations. In 2015 alone, Americans donated $373.25 billion to nonprofit organizations and of that amount,

$268.28 billion was given by individual charitable donors – more than foundation giving, bequests, and corporate donations combined (National Philanthropic Trust 2015). The World Giving Index in 2015 again named Myamar as the country that is the most giving in terms of donating money to charities, with 92% of those surveyed having donated in the past month. Strong philanthropic principles in Myamar's Buddhist religion contribute to their citizens' high level of giving. Thailand came in second at 87%, followed by Malta at 78%, the UK at 75%, and New Zealand and the Netherlands tied at 73%. Overall, 63% of the US population donated money to charitable organizations in 2015 (CAF 2015) with financial contributions spanning across a variety of funding areas.

As with volunteering, there are numerous types of organizations that receive charitable donations. According to the Urban Institute, in the US religious organizations and congregations received the most charitable donations in 2014, roughly one-third of all donations. Education and human services organizations received the next largest portion of financial donations with 15.2 and 11.7% of the total, respectively (McKeever 2015).

Both volunteering one's time and making charitable donations to nonprofit organizations allow citizens to support shared goals related to the issues and cause important to their lives and to support organizations that advocate and lobby for important social change and policies that matter to them. It is a means to express their needs and wants to local, state, and national governments, which is one ingredient that helps sustain democracy. These are reasons why volunteering in and charitable donations to nonprofit organizations are methods of citizen participation.

### Membership

The third method of citizen participation in nonprofit organizations discussed in this entry is that of membership in voluntary associations. Although organizational membership has declined over the decades, it is still an important aspect of citizen participation (Skocpol 2003). One of the more well-known methods of membership is with community associations such as homeowner's associations and cooperatives. In 2015, there were an estimated 338,000 community associations in the USA with 68 million Americans or 21.1% of the population as members. A reported 30–40% of community associations are self-managed with about 2,350,000 community association board/committee members. In 2015, association board and committee members performed an estimated 80,000,000 hours of service worth $1.76 billion (Community Associations Institute 2015).

Membership in these organizations is considered a principle central to American democracy. Generally, the purpose of membership in associations is to support and serve the members. However, today the tendency for citizen participation is to do so by giving time and money and not through membership. The social movements of the 1960s and 1970s contributed to a shift from membership in association to more professionally managed undertakings. Even so, membership in voluntary organizations is still important for developing democratic knowledge and skills in citizens, a key reason membership is a method of citizen participation. Motives for participation in this manner include citizens having a positive view of her/his neighborhood and a solid sense of community (Florin et al. 2000).

## Benefits of Citizen Participation in Nonprofit Organizations

Citizen participation is important for strengthening advocacy, improving responsiveness to beneficiary needs, and developing strong democratic societies. Through nonprofit organizations, citizens are able to act on their civic right and have some degree of influence in the political sphere. Citizens of all socio-economic classes take part in nonprofit organizations and as such it is considered one of the most important contributions of nonprofit organizations. There are many advantages associated with citizen participation including creating an educated, cooperative, empowered citizenship (Irvin and Stansbury 2004), helping to

protect freedom, and generating policy that responds to the needs of citizens and institutional systems that align with the wants and needs to the people (Roberts 2004). This section covers just a few of the proposed benefits related to citizen participation in nonprofit organizations, specifically citizen involvement in decision-making processes and citizen development.

Benefits of citizen participation occur on the national, community, interpersonal, individual, and international level and can lead to positive developments for communities. One of the most important components of citizenship in democratic societies is for citizens to have a voice in decision-making processes, which participation in nonprofits helps to do while also promoting community development and improving quality of life. Community development is conventionally defined as voluntary group of community members that are working to better the community both economically and socially by promoting people and communities using their talents and skills together to solve social issues and to tackle more than one societal problem at a time and in turn get citizens involved in decision-making practices. Nonprofit organizations are instruments for collective interests to be pursued through citizens taking an active role in decision-making efforts and give them a means to both challenge and get power. Involvement in decision-making processes within a nonprofit organization engenders power sharing between the government and citizens and fosters a sense of empowerment, whereby the more marginalized members of society can be involved and the organizations that address social issues can transform individuals into active citizens engaged in their democracy. Moreover, participation in nonprofit organizations assists in creating greater support for democratic systems and building political awareness in citizens (Florin et al. 2000).

The other benefit is that of citizen development. History and scholarship has demonstrated that when citizens actively participate in nonprofit organizations, they learn to self-govern (Dobkin Hall 2010). Many have argued that voluntary organizations are valuable in teaching citizens' self-government. Voluntary associations help to advance social goals in part because of the close relationships and networks that are created by local people connecting to larger social movements (Skocpol 2003). There is also a connection to religious beliefs, patriotism, and/or level of education as well as race. Membership in voluntary associations is also said to teach values and skills which are necessary for a society to be inclusive to all its citizens. In the twenty-first century, advocacy groups and nonprofit organizations have a large presence in society because people use them to seek to have some influence in their communities (Skocpol 2003). It can also function as a way for citizens to speak their needs and wishes while developing as citizens in a democracy, including developing leadership and problem solving skills, and greater democratic knowledge. Citizens learn how to take an active role in governance and to be engaged and enlightened as citizens within a democratic society. This type citizenship can only take place when citizens are working together collaboratively, listening to one another and engaging in dialogue. Based on this idea, one outcome of citizen participation is to stave off political processes controlled by authoritarians (Roberts 2004). In democratic societies, citizen participation can counter a government and society run by administrators and misinformed citizens.

## Barriers to Citizen Participation in Political Systems

There are challenges organizations and individuals face pertaining to citizen participation in nonprofit organizations. First, it is important to note that citizen participation in nonprofit organizations is highly dependent on a number of factors such as the degree to which citizens and organizations are free to engage in political systems, sociocultural norms and expectations, and resource availability. For example, participation by citizens in nonprofit organizations in developing countries might be hindered by an undefined civil society, an undeveloped public sector, or the effects of poverty. Developing countries also face challenges to citizen participation when government is hostile to nonprofit interference, democratic values, or has a culture

of corruption in terms of favoritism or lack of transparency in intuitions (Denhardt et al. 2009). In societies dealing with corruption, the many challenges to citizen participation include the possibility of public officials misusing government money intended to help citizens, the absence of any means for citizens to confront corruption, or even ongoing violence. Corruption has an overwhelming effect on the marginalized and poor in developing societies, cutting off resources or access to welfare type support (United States Institute of Peace 2010).

In democratic societies, barriers include unequal citizen representation and the notion that it is inefficient and impractical. These challenges can act as an obstacle to genuine citizen participation that seeks positive social outcomes. Concerning unequal representation, an issue of this is that differing interests can emerge due to gaps when representing all citizens. Since citizens participating in nonprofit organizations through volunteering are unpaid, most of those that do take part are generally of a higher socioeconomic status (Irvin and Stansbury 2004). This could mean that citizens with greater wealth or those who are highly political or passionate about one specific topic will take part more than other citizens of lesser means. The result is inequality in representation, which opens up the possibility for special-interest ideas and groups to control the decision-making processes that affect the broader citizenship (Irvin and Stansburry 2004). The other barrier is that citizen participation can be inefficient and impracticable because societies today are complex and democratic governments may be too large to foster direct participation whether because of cost and the various hurdles that slow down the process. One aspect of the inefficient notion is that citizens do not have wherewithal to understand the inner workings of institutions and in matters of the running of government and public matters. As such governments and societies have to rely on professionals who can better inform decision-making processes. Moreover, direct participation is unrealistic because people may be too busy or may not want to directly take part in decision-making processes through nonprofit organizations (Roberts 2004).

## Conclusion

Citizen participation is the act of citizens taking part in certain activities with nonprofit organizations to exert some political influence and to play a role in decision-making processes. This entry discusses three methods of citizen participation in nonprofit organizations –volunteerism, charitable/financial donations, and membership in voluntary associations. A political context is provided to garner a better understanding of citizen participation as it relates to nonprofit organizations. This context is based around participation as a right of citizens and a method to develop citizens in democracies. The prevalence of each method is reviewed as are the reasons that these three activities are methods of citizen participation. Also, benefits related to citizen participation were provided, including the increased involvement of citizens in decision-making processes and the development of citizens' democratic knowledge and skills. There are several barriers to citizen participation including unsupportive political systems, corruption, unequal citizen representation, and the notion of participation as inefficient and impractical.

## Synonyms

Citizen deliberation; Citizen engagement; Citizen participation; Public administrator; Public bureaucrat; Public manager

## Introduction to Citizen Participation

From keeping bureaucrats and policymakers accountable to the public interest, to participating in voting, and other democratic-based processes, citizen participation plays an especially important role in public management. With effective mechanisms of citizen participation in place, public management becomes more dynamic. It responds more proactively to citizen concerns and ultimately is better able to meet the challenges of constantly shifting political and policy environments (Denhardt and Denhardt 2015). Without effective citizen participation, public management often becomes static and fails to recognize and respond to the important political and policy challenges of the day.

Yet, citizen participation in public management possesses a number of underlying challenges that often inhibit it from being effective. Depending on the political climate of the day, policymakers may try to suppress meaningful citizen participation opportunities for citizens. This is most evident in periodic restrictions on voting placed on citizens (Keyssar 2009). Often trained to be value neutral, public bureaucrats also sometimes deemphasize the subjective, value-laden perceptions expressed by citizens in order to better emphasize efficiency (Simon 1957). Many times, citizens themselves also avoid the responsibility of citizen participation in public management. Voting rates among citizens are low in many democratic countries without mandatory voting laws (Blais 2000). Perhaps more ominously, citizenship, democratic, and social deficits have now been documented, especially among younger generations of citizens (Levine 2007; Putnam 2001). These deficits often result in citizens avoiding most mechanisms of citizen participation with the consequent outcome of a loss of faith and trust in governance institutions over time.

In the following sections, different dimensions of citizen participation will be discussed with a special emphasis on why these dimensions are important to solving the complex problems confronting the future of public management. These sections present a synoptic view of citizen participation. That is, citizen participation is

viewed as an all-encompassing concept that includes voting, direct democracy, participating in advisory committees, and deliberating on actual governance decisions for public institutions. In this way, deconstructive theoretical discussions that parse specific distinctions and definitions within citizen participation are avoided (for such discussions, see Arnstein 1969; Frederickson 1991; Roberts 2004). Additionally, by embracing a wider conceptualization of citizen participation in public management, linkages between the democratic and administrative dimensions of citizen participation can be clarified in regards to solving the future policy challenges of government.

## The Democratic Dimension of Citizen Participation

When analyzed from a synoptic view, citizen participation in public management can be categorized into two different, overarching dimensions: a democratic-based dimension that places most of the burden of effective participation on the citizen and an administrative-based dimension that places most of the burden on the public bureaucrat (also called the public manager or public administrator). The democratic-based dimension primarily views citizen participation in public management in terms of voting. Voting, when viewed through citizen participation in public management, can include two distinct processes. First, citizens can vote for political leaders who influence public management after taking office. This is the classical view of voting present in democratic forms of government. Citizens can be influenced in their voting behavior by a variety of conscious and subconscious cues, but overall, citizens vote for the political leader that best maximizes their own notion of utility (Downs 1957).

Second, citizens can vote in direct democracy endeavors. Building from the New England town meeting form of government, where citizens of a town could directly vote on all governance matters (Zimmerman 1999), and responding to massive amounts of political corruption in governments during the 1800s (Bowler et al. 1998), direct democracy allowed citizens to vote on their own, citizen-crafted legislation (i.e., the ballot initiative), vote whether to accept legislation espoused by currently elected political leaders (i.e., the referendum), and vote whether to remove certain political leaders from office (i.e., the recall). While not available in every level of government and nonexistent in most national governments, direct democracy allows citizens the opportunity to more directly participate in public management.

Such dimensions of participation have their share of challenges. For example, the New England town meeting form of local government, where citizens directly vote on many decisions, historically suffered such problems as low citizen interest to infrequent meetings to an overt reliance on other levels of government to provide for needed services (Brown 1955; Janiskee 2010). Additionally, powerful interest groups typically use direct democracy to promote their own interests above the interests of all citizens in a state or community (Ellis 2002). In order for these challenges to be overcome, citizens have to be invested and active in the process. As a result, whether through traditional voting or direct democracy, this dimension of citizen participation in public management depends on the citizen. In particular, direct democracy places the burden of participation on the citizen with citizens often having to collect a relatively high number of valid signatures from other citizens to support any type of direct democracy initiative. In this way, direct democracy corresponds to traditional voting processes that already placed the burden of participation on the citizen.

While typically minimized in overviews of citizen participation, voting and direct democracy are vital components for ensuring that citizens have the desire and commitment to participate in more complex forms of citizen participation in public management. Indeed, if most citizens ignore or actively disregard this dimension of citizen participation, then the future of public management in a democratic society may be in peril. After all, in an ideal democratic society, citizens help to solve community problems (Levine 2013). And with the power of voting and direct democracy, citizens are informing policymakers of their preferred solutions to existing community problems while concurrently

showing their faith in government to solve them. Such commitment from citizens is even more important in other forms of citizen participation where administrators rely on direct citizen input to make decisions and solve policy challenges.

## The Administrative Dimension of Citizen Participation

The need for professionalized public management, with unelected bureaucrats making decisions for the public good, increased in the late 1800s. Due in part to the massive transformations wrought by industrialization and urbanization, as well as in reaction to the spoils system of politics where political leaders rewarded unqualified supporters with bureaucratic positions in government, professionalized bureaucracies of value-neutral, non-political administrators spread through national and subnational governments. Because of this trend in public management, a second dimension of citizen participation in public management became more important. In this administrative-based dimension of citizen participation, citizen accountability over bureaucratic decisions and citizen input into the governmental decision-making process developed into a significant avenue of citizen involvement in public management. In this dimension, citizens could take an active part in administrative-based processes such as bureaucratic rulemaking. They could also make recommendations on governance and policy directly to policymakers and administrators by serving on advisory committees. And perhaps most impressively, they could join other citizens in governmental sponsored forums to deliberate on important policy challenges and then make the actual decision on the appropriate governance solution. These types of processes aspired to make governmental decisions more transparent to citizens and ensure greater citizen accountability over public management. Additionally, with processes like citizen forums and citizen deliberations, this dimension of citizen participation opened the often insular world of the public administrator to new ideas from citizens in the external environment.

Citizen participation in bureaucratic rulemaking decisions became codified in various administrative procedure acts passed by the federal and state governments from the 1940s to the 1960s. These acts helped to establish the concept of administrative law and allowed for citizens to provide input, called public comment, on most proposed administrative rules written by bureaucrats before they were implemented (Rosenbloom 2003). However, in practice the use of administrative rulemaking sometimes seemed to minimize citizen interests. Politics, administrator concerns over loss of power in rulemaking, and excessive unease over legal ramifications have often prevented administrative rulemaking from reaching its original intentions regarding citizen participation (West 2005).

As the bureaucratic state grew to provide more services to more citizens, the role of citizen-led advisory committees also became more important. Nominally existing to provide a level of citizen input to government entities, advisory committees allow policymakers to appoint citizens to a committee that help an agency gain citizen support and often allow the agency to protect itself from excessive political intrusion (Selznick 1949). This more politicized use of citizen advisory committees primarily occurs in national and state governments. However, in local governments, the value of these types of committees became apparent. In local governments, citizen volunteers can serve on many types of advisory committees, from committees that make zoning recommendations to boards that ensure oversight over police services. These types of committees depend on citizen volunteers to make recommendations on policy solutions to both administrators and locally elected policymakers. While these local advisory committees can sometimes be controlled by narrow political interests, generally, they provide an outlet for citizens to sway local governance decisions so that ideas regarding the public interest, public good, and direction of the community are protected.

Building on the use of the citizen volunteer, citizen participation in public management gradually gave more opportunities to citizens near the

end of the twentieth century. Especially in local government, administrators have started to invite citizens to policy forums to discuss specific issues confronting a community (Lukensmeyer 2013). Citizens have also invited to make recommendations on budgetary decisions in participatory budgeting meetings (Shah 2007). Most impressively, some communities have actively used citizens in active deliberations where citizens would make decisions on important policy challenges (Leighninger 2012).

From a theoretical viewpoint, these newer processes view the citizen as a collaborator in governance (Thomas 2012). Input from citizens results in better, more effective governance decisions and also concurrently helps improve the image of government with citizens (King 2011). But such newer processes often carry a heavy burden with administrators. After all, many public administrators were historically trained in the idea of the bureaucrat as the neutral expert making decisions based in efficiency for the betterment of all citizens. Thus, one of the most enduring challenges to meaningful citizen participation is the entrenched bureaucratic dynamic that views citizen decision-making as anathema to effective public management (Kweit and Kweit 1984). Consequently, the burden of effectively implementing forums or citizen-led deliberations resides with the administrator. Of course the citizen still has to possess the desire to participate in these newer processes, and much scholarship has explored whether citizens even have the capacity to participate in these processes (Levine 2007; Putnam 2001; Skocpol 2003). But the immediate burden of whether these processes are successful often rests with the administrator, rather than the citizen. For instance, recent studies emphasize how administrators should design citizen-led deliberations and hearings to achieve maximum effectiveness (Nabatchi 2012).

## Solving Problems with Citizen Participation

These two dimensions, both democratic and administrative, help to define the environment of citizen participation in public management. When operating well, these two dimensions help to ensure a dynamic style of public management that can proactively respond to policy challenges before significant problems occur. As policy challenges become more severe and existential, the importance of these dimensions of citizen participation in public management increases.

For example, from environmental challenges like climate change, to the need for providing sustainable services to an increasing population of elderly citizens, all levels of governments face significant challenges in solving policy problems. These problems are severe and potentially intractable, involve multiple stakeholders and multiple levels of governments, and are only solvable by making difficult decisions that include significant policy trade-offs that will have definite political consequences. In many ways, the success or failure of twenty-first-century public management rests on the capacity of governments to solve these types of wicked problems by using effective citizen participation in their governance decisions (Kettl 2002).

Wicked problems were initially described in the context of social planning policy. In their initial research, Rittel and Webber (1973) strived to move the analysis of public policy problems from the objective, rule-bound, econometric modeling approach that worked well for simplistic or "tame" policy problems to a more subjective, open-ended approach that recognized the true complexity of many public policy problems. In this view, wicked policy problems possessed the following characteristics: the framing of the problem influenced the solution, different stakeholders with different policy frames had substantially different interpretations of the problem and the solution, problem definitions and resources needed in solving the problem changed over time, and the problem was never truly solved (Rittel and Webber 1973). Consequently, because of subjective policy frames and shifting problem parameters, wicked problems could not be solved by the traditional, bureaucratic policy tools then in favor of objectively defining the problem and then sequentially analyzing the problem with econometric analyses that yielded some beneficial

solution. Instead, a different type of approach was needed.

That approach uses various dimensions of citizen participation in formal and informal networks of governance. Included in these collaborations are networks of citizens, interest groups, other governments, nonprofit organizations, and for-profit organizations where different types of specialties could bring forth the knowledge and implementation power to meet the challenge of a wicked problem (Agranoff 2003). An emphasis on these types of collaborations currently influences the ways that many governments operate (Goldsmith and Kettl 2009). Before any collaborative policy response can occur, however, some preconditions must exist to facilitate the union of stakeholders who often have differing backgrounds, resources, and attitudes toward the issues at hand. Partnerships, interlocal and regional agreements, networks, and other types of collaborations cannot just be called into creation by mandate; to succeed, some type of preparation or capacity building for the collaborative effort has to occur. These preparatory efforts, often entailing knowledge sharing, communication, repeated cooperative efforts, and inculcating shared values among of the various actors, are necessary for any collaborative effort to succeed.

And in this regard, citizen participation in public management holds great significance. By using avenues of citizen participation in public management such as forums and citizen deliberations, greater knowledge sharing and communication among different groups of citizens occur. Overall, this should increase the quality of decisions emerging from public management by ensuring that different experiences, viewpoints, and concerns are considered. However, as the need for collaborative policy responses increases, the capacity of governments to successfully manage these types of responses may be declining due to challenges related to funding, political opposition, and citizen fragmentation. This paradoxically results in governments knowing that they must engage the citizen and other partners in policy formulation and service provision, but not being presented with enough funding to ensure an appropriate collaborative experience.

## Conclusion

The "direct democracy" reforms of the 1800s in state and local government, which allowed citizens to recall policymakers, initiate laws, or vote via a referendum on laws already passed by policymakers greatly expanded the powers of citizens in their government and helped to usher in an era of more citizen control over their state and local governments. While the tools of "direct democracy" can be influenced and even corrupted by national interest groups, they at least expanded the scope of democracy for citizens. Such expansions continued in the 1940s–1970s with administrative procedures acts in all levels of government designed to increase government accountability with increased transparency. These movements especially emphasized the importance of engaging citizens to help ensure citizen accountability over unelected public managers promulgating administrative rules and elected policymakers crafting new laws or new governance decisions. By the 1990s and 2000s, even more direct citizen engagement techniques were advocated with citizens often exercising more deliberation and even actual decision-making authority in more avenues of policymaking.

In many ways, this evolution in the use of citizen participation in public management shows the value of citizens. With trends such as participatory budgeting, deliberative forums, and enhanced town meetings influencing the current agenda of many local governments, citizens arguably now have more opportunities to participate in governance than ever before. The key question for citizen participation in public management going forward is whether citizens have the commitment to participate in public management and whether administrators and policymakers will accept the decisions of citizens in more policy domains. If more and more citizens become involved in these opportunities and if public administrators and policymakers recognize the virtue and value of their input, then public management can become better. However, if that does not occur, then the value of citizen participation in public management will be lost.

Engagement; Involvement; Participation; Process

## Definition

Citizen participation is a process by which citizens' concerns and needs are encompassed in the policy decision-making process of the local authority. The process requires a combination of joined relationships – an activity in which citizens attempt to affect government decisions to improve them, while the local authority activities should match the citizen's views and needs appropriately.

## Introduction

Citizen participation is generally held to be a good thing in the public administrative decision-making. The focus on citizen participation increased in practice mainly because government officials have assumed more responsibilities in the local governance of the communities and with much less and limited resources. But also they realized the opportunities associated with the process, as it provides valuable insights on the needs, priorities, and information on what it matters to the local community.

Over the past decades, scholars dedicated significant interest to illustrate the nature and impact of the participation initiatives (e.g., Arnstein 1969; OECD 2001), and the models paved the basics of citizen participation. Generally, citizen participation is a process of encompassing citizens' concerns and needs in the policy decision-making process of the local authority. It is an activity in which citizens attempt to affect government decisions to improve them, while the local authority activities have to match the citizen's views and needs, appropriately. The effectiveness of the participation depends on local institutional contextual factors enabling or hindering the participation. The formal institutions of power and functions of decision-making (top-down vs bottom-up approach) and how the local governance encourages forms of direct participatory interaction and interdependence, rather than hierarchy and subordination (treating citizens not just as service users or customers of services, but as active citizens), are essential. Modes of interaction, in the relationship of local authority and citizens, are complex and can happen in a small local laboratory – which brings to the fore the local authority participatory strategy linked to various rationales and mechanisms of participation (OECD 2001) to address the issue at hand.

The shift from local government to governance paved the need for engagement of citizens in the decision-making process. Local authorities have the ability to fostering civic engagement in the policy decision-making, because, at this level, the concerns of the "grassroots" intersects directly with those of the state and governance (Gaventa and Valderrama 1999), and a high concentration of time and resources are spent locally, on the direct delivery of services (Kettl and Fesler 2008). Meaningful citizen participation depends on the willingness of interaction of the local authority officials. Therefore, whether an approach is suitable for a public official, it depends on the motivation and rationale of the public officials to address the issue at hand by involving and hearing citizen's voices in the matter. The motives driving the engagement and its approaches are distinct in concerns and not easy to connect, but they are united by the common aim that enables citizens to participate and influence policies effectively.

Local needs and priorities drive the overall approach to participation on the policy agenda. Citizen participation appears to be an essential strategy, to address the increasing social complex needs of the local community. However, local authorities' receptiveness to accommodate citizens' preferences in the policy decision-making and service delivery are highly depended on their rationales to satisfy either societal or managerial goals. Therefore, the "public administrators through their actions, are central to the success or failure of participatory efforts" (Callahan 2007, p. 1181). Some studies have suggested that citizen involvement is a resource for local development, raising normative and instrumental motivations (Svara and Denhardt 2010) around the *why* question (rationales) of the participation.

The theory and practice of citizen participation outline various debates around the concept, so the nature of citizen participation, including its

rationales and approaches, are sketched out. This chapter discusses the citizen's involvement in the local authority policy decision-making and service delivery and refers to the process as the mean through which citizens has a direct voice and power to influence the decision-making. When talking about citizen participation relates to the involvement of citizens/group of citizens (individual, informal, or formal organized groups (e.g., nonprofit organizations)) in the policy decision-making process before the decision is taken and implemented. Such a process might be meaningful as it allows local authority officials to process relevant information on the local needs and can result in a more effective and efficient decision-making process and public service delivery.

## Drivers of Citizen Participation in the Policy Agenda

Various shifts have placed the interactions between local authority and citizens in a new sphere of relationships at all policy stages. The attention to citizen participation increased in multiple areas – governance, management, and public service delivery. A shift emerged in the attitude of local authorities from serving citizens and treating them as service users to "engaging citizens" (OECD 2005a) in the policy process and strengthen citizen participation in service delivery and management decisions (Langton 1978) and public decision-making (Creighton 2005) (e.g., budgeting or public service functions, including economic, social, and environmental).

A shift from the traditional bureaucratic set of state–citizen relationships toward a new relationship system of local governance (Denhardt and Denhardt 2003) put the citizen (a) at center of piloting of the public organization and (b) opened new channels of involvement at local level, bridging a transfer of responsibilities from a *passive* to an *active participation* in the policy process. Governance meant a governing arrangement which engages stakeholders (institutional and nonstate actors) in a formal collaborative decision-making process, based on *consensus* and *deliberation* (Ansell and Gash 2007). Citizens are an integral part of the governance process, and their active involvement is essential criteria for the decisions to be taken (Roberts 2004).

As well, it allowed emerging new institutional actors from the traditional forms of government or in independent ways, including different models of governing and coordination where public and private actors are involved (Peters and Pierre 2003). The shift changed the nature of local governance, where nonprofit organizations have acquired responsibility and raised new forms of collaborative interactions (Eikenberry 2007), and therefore changed the attention from the traditional inward pattern of relations toward an outward-oriented model. Consequently, it increased the citizen role in all stages of the policy cycle – where citizens, interest groups, and public and private organizations that have a stake are involved in the preparation and delivery of the policy decisions.

There have been introduced reforms with the intent to cope with the increased and complex needs of society. There are complex needs and expectations of the community to deliver more and better services, and the strategic action of the local authority to address the needs is under pressure because of limited resources and budgetary burdens and also due to inefficiencies of the local bureaucracy. For example, the reforms' proposals targeted to improve the end of service satisfaction. Managerial proposals (e.g., New Public Management) aimed to reinvent public system to address consumer/taxpayer needs and to meet their needs most efficiently and effectively. Although, it is just a part of the problem that is touched, as the citizenship is more than just being a customer and client of government services. The critical managerial proposition in improving the relationships with citizens (e.g., market mechanism, customer satisfaction relationships, and instruments of performance accountability) needs to be complemented by a democratic proposal (e.g., the rule of law, civil rights, direct participation). The aspect of ethics and civic democratic values in the relationship is crucial to enable meaningful involvement and an essential criterion of citizenship, although often it is missing. The process of democratic interaction between citizen and local authority in the local

governance of policies and service delivery should address the issue. The democratic gap affects the trust of the citizens in the local authority and their actions. An essential pillar of democracy is the citizen's participation in the decision-making process, and incorporating the democratic process into the decision-making is not an easy task. Direct democracy is different than representative democracy (e.g., extensive use of referenda) and brings new channels of engagement of the citizens from a passive to a more active role in the policy process decision-making and service delivery (Denhardt and Denhardt 2003). It is about active engagement or the actions of citizens (or just categories of citizens) that express their direct voice and effectively participate in public decision-making. So far, the direct democracy and citizen participation have been seeing not to replace representative democracy but rather to renew and deepen it.

## Defining Citizen Participation

The "public participation" is not synonymous with "citizen participation" mainly because public involvement involves a wider concept which may include citizen participation. The term citizen participation does not have a fixed definition. Citizen participation is bound up with notions such as "public," "citizen," "involvement," "participation," and "engagement," and the terms are often used interchangeably or synonymously. However, whether it is about engagement, involvement, or participation, broadly their common characteristic is that refers to *action* and means *to take part* and *to be included* in certain activities, or to an engagement in a specific context.

Few observations are to be made, regarding the defining parameters of citizen participation, although the theoretical breakthrough of the term is not simple. Its parameters are defined by the following:

(i) *Voluntary approach:* A basic operational understanding of citizen participation, according to Andrè et al. (2012, p. 1) definition is referring to a "process in which ordinary people take part in the policy process on a voluntary basis," and it can be "the citizen alone or as part of a group, with the aim of influencing decision policies involving significant choices that will affect their community."

(ii) *Behaviours and actions at varying degrees and forms*: Such as (1) individual initiatives and (2) organized activities. Vigoda (2003) identifies two levels of active citizenship behavior that comprise the citizenship behavior hierarchy, including (1) individual-altruism and voluntarism in the national, communal, and organizational settings; (2) collective-organized citizenship behavior (or semi-organized) represented by interest groups, volunteers, nonprofit organizations, and third sector. Further, the author distinguished three organizational communities as (1) individuals; (2) citizens in small and unorganized groups; and (3) larger groups or communities of citizens that are usually formal and long-lasting (e.g., nonprofit organizations). The individual citizenship behavior refers to the very basic construct of personal actions and reactions by citizens (Vigoda 2003). The activities can be initiated by altruistic unorganized citizens that can contribute money, time, and resources to assist disadvantaged categories without seeking any personal advantage or compensation (e.g., voting, volunteering, making donations, and so on). The citizens as groups comprise semi-organized and fully organized actions initiated by groups of individuals. The citizenship at this level emerges when a group shared a mutual interest and joined willingness to be actively involved in voluntary endeavors (e.g., informal associations or formal engagements in the community).

(iii) *Power relationships:* Citizen participation is about the active engagement in purposeful activities in the area of which citizens are legal residents (Langton 1978). Citizen participation means that citizen has power; it is about power and its exercise in the interaction between citizens and local authorities

(Gaventa and Valderrama 1999), although the control of the structure and process of participation is usually in the hands of the local government officials. Therefore, active citizenship is about engaging citizens, and the process of engagement means sharing power with them in purposeful activities of the local community. Consequently, it is about interaction, not just about getting input from the citizens. Thus, at its most basic, participation is "to take part" in decisions of the state, where citizens voice will have an *impact* on the final decision-making and ensure that local authority performs as expected in the interest of the community.

(iv) *Nature of participation*: In practice, citizen participation in the decision-making process is classified at various levels, based on the "degree to which citizens are involved, the direction of information flow between participants or the status of those who have taken the initiative" (André et al. 2012, p. 2). Traditionally, the information was the primary means of communication in the relationships between the local authority and citizens. Regarding political participation, the approaches consisted of "voter education, enhancing the awareness of rights and responsibilities of citizens, lobbying and advocacy" (Gaventa and Valderrama 1999, p. 3). For example, Svara and Denhardt (2010) define public engagement as citizen's direct involvement in public affairs – beyond the passive participation exercised by experts, elected officials, or bureaucracies – and cannot equate it with one-way communication (only transfer of information) between government and citizens. The authors made an argument along these lines, stating that the process moves beyond just involving citizen in voting and hearings, toward finding effective ways to get citizens involved and to work along with them. They argue as well, for a broader understanding of citizen involvement, equating it with the engagement at different levels of the decision-making process – in setting goals, policies, and service delivery. Therefore, a significant gradual shift is observed in the discourse about participation from the role of local authority of just providing "service to citizens" (OECD 2005b) to "engaging citizens" in policymaking (OECD 2005a), so going beyond traditional used methods of voting and hearings, by effective joint working in the policymaking. This stream contends that genuine participation occurs when a citizen is engaged in administrative decision-making, and act as owners and co-producers of public goods (King et al. 1998). King et al. (1998) Pointed out that genuine, authentic participation happens when there is active citizen participation which means that the process is citizen-focused, placing citizen at the center of the decision-making process.

## State of the Art: Citizen Participation Approaches

Various models framed the processes of citizen participation and discussed different levels of involvement that shaped the participation processes. An example of the typology of citizen participation is the classical model developed by Arnstein (1969), who proposed a "ladder of participation" with eight levels, correlating to degrees of citizens' power in decision-making. Finally, OECD publication (2001) introduced a simplified framework of participation levels in the policy process, namely, three different levels of citizen involvement, based on information, consultation, and active participation.

*Ladder of citizen participation, Arnstein (1969):* A primary categorization of the continuum participation levels in the model developed by Arnstein (1969). Arnstein' ladder of participation is an important conceptual approach that describes degrees of citizen participation and citizens' power in decision-making corresponding with varying levels of participation. It shapes the participation processes by introducing eight levels of participation: manipulation, therapy, informing, consulting, placation, partnership, delegated power, and control. The model shows the

shift from nonparticipation to consultation and going beyond toward the level where more meaningful participation can happen. Citizen has the agency to influence policy decision-making. Therefore, citizen participation correlates with citizen power, as it goes beyond mere passive participation or any process which does not transfer power "token." The proposed module of participation reveal the ambiguities in defining citizen participation, and it makes it not in a single act but a scale of possibilities. The higher the degree of the involvement, the better level achieved.

*Model of decision-making by Thomas (1995):* The model offers a practical conceptual framework, which proposes an "effective decision model" that argues that specific core attributes of a policy problem help to identify the value of participation and those who might be involved in the participation process. The engagement should be aligned with the appropriate participation techniques, depending on the perspective of the policy goals at hand. Likewise, the decision-makers should classify the policy problems to decide the nature of participation to be adopted. Therefore, based on the nature of policy problems there are five approaches to decision-making (Thomas 1995). The approaches are (a) autonomous decision-making which solves the problem alone; (b) modified autonomous decision-making, which seeks information from citizens, but the final decision may or may not reflect citizens' opinions; (c) segmented public consultation, which shares the problem separately with the public and makes a decision which reflects the group ideas; (d) unitary public consultation, which shares the problem with a single assembled group and makes a decision which reflects group ideas; or (e) public decision, which shares the problem with the public and together reach agreement on a solution.

At one side the public manger makes decision autonomously, while at the other end fully adopts an inclusive process of decision-making. Therefore, each method requires different participatory mechanisms, from seeking information till making decision (joint decision-making). Deciding to use participation approach depends on the judgment of the managers, who must accurately categorize an issue and determine what mechanism of participation is appropriate. The model locates the participation in the realm of the government institution policy agenda, connecting the idea of its importance to address the policy problem at hand and recognizing the linkage between the strategy and the participative instruments to be employed.

*Model of participation in the policy cycle (OECD 2001):* The OECD's Public Management Service Working Group on Government-Citizen Connections argues for a framework of engagement based on three levels of citizen involvement: information, consultation, and active participation (Fig. 1).

## Scaling up the Approaches to Citizen Participation

*Information-based approach:* It is, substantially, an approach of "information sharing" and doesn't imply meaningful participation: disclosing just information implies that the participation is low; it is a one-way relationship. Initially, the "information sharing" is a crucial basic requirement, setting the first relationship, although in one directionality from the local council to the citizen. The relationship is based on a citizen's passive access to information upon demand and "active" measures taken by the council to produce and disseminate information. At this stage, the control over the data to be shared remains with the policy managers, with particular attention to laws and regulations. "Information sharing" is crucial to policy implementation. It needs to be by the democratic governance principles and to have effective consultation and collaboration all the higher levels of participation; it depends on participants having the right knowledge. Citizens need to know what public authorities are supposed to do, what they plan to do, what they are doing, and with what results (transparent, responsive, and accountable way).

The approach reflects the traditional public administration model of relationships between the governmental institutions and citizens. It sets the base of communication in the relations between citizens and their government. In such

**Citizen Participation: Rationales and Approaches, Fig. 1** Levels of citizen participation in the policy process. (Source: Author elaboration on OECD 2001)

a model, the government institutions control the design for decision-making fully, being at the center of the policy process and with a strong producer role. The politicians act as sovereign political decision-makers who rule by passing laws; public administrators as bureaucrats who implement laws; and citizens as voters and subjects between elections (Torfing et al. 2012). There is a hierarchical, top-down relationship between government and citizens. The citizen role is mainly passive, as a user or client of services, but without a meaningful power in the decision-making. Therefore the citizens are not at the center of the policy agenda, as they are dependent on the bureaucracy and experts who takes the decisions (Callahan 2007).

*Consultation-based approach:* Substantially based on two-way information flow and exchange of views, although decision-makers control the final decision. When the consultation process occurs, the government goes beyond just the information flow to listening and gaining feedback from citizens on the issues concerned. The governmental institutions *a priori* establish the problems that require citizens to express themselves on.

The approach reflects the managerial proposition to address the deficit in the relationships between citizens and governmental institutions, encouraged by public management (new public management) model. The model promoted itself as an enlightened ruler model emphasizing customer orientation but seeks to keep control of all phases of the policy cycle. The public manager in the policy development plays unique roles, such as that of policy entrepreneur and a responsive function to customer demands, to structure policies so that the customer can choose. The public administrators (as "entrepreneurs") are urged to act independently to move their preferred policies forwards, and, at the same time, they should evaluate the needs (Denhardt and Denhardt 2011). Such role type has been criticized, regarding the fact that allows opportunistic and uncompromising behaviors contrary to traditional democratic accountability and fiscal integrity of the government. The public manager's role is to structure choices for customers. It proposes an alienation of public sector outcome to citizens' priorities in a cost-effective manner. However, the pattern of the relationship is unidirectional. The ethos of responsiveness keeps citizens in a passive relationship with the public organization, allowing the power of "exit" but not the "voice" (Vigoda 2002). The participation is self-interested, focused on the moment of exchange, and does not have a broader political or social component, being materialized only at the moment of service exchange. The model instead places efficiency, competitiveness, and autonomy (e.g., autonomous human resources management, incentives) at the center of the concerns. The service management aims to

customer satisfaction rather than the public interest in service provision.

*Active participation approach:* This level enables partnership, control, and joint decision-making. When active participation occurs, it is a relationship of collaboration, with active citizens' involvement in decision-making. The approach should impact the operational procedures of the local council, leading to the implementation of new instruments to complement the traditional tools of general representation of citizens' interest. It requires institutional efforts to put in place a methodological system that can facilitate the inclusion of stakeholders in decision-making. The process has a dual function, regarding the search of ways of (i) interacting with the citizens, to enable them to represent their needs, and (ii) to consider diversified opinions in solving the issues in the local governance, to complement traditional tools of general representation of citizens' interest. This process acknowledges citizens participation in shaping the policy agenda through dialogue, but the final decision rests with the government.

The approach reflects the shift of attention to a "new public service" (Denhardt and Denhardt 2000) model based on community value driven by equity, fairness and civic sense. According to the model, the public administrator is in a new governance framework with forms of service delivery based on interaction, collaboration, better articulation and expression of needs, trust and attention to community values and citizen interests. The new values aim to increase public institutions integrity and responsiveness. The local governance context enables the presence of democratic citizenship, and public administrators serve and empower citizens (Denhardt and Denhardt 2000). Within this context, citizens act as partners in jointly producing a public service, not as customers seeking a service (Thomas 2012). This approach shows the necessity of engagement with the state, and a shift from a traditional bureaucratic set of state–citizen relationships toward a new relationship system of governance (Denhardt and Denhardt 2003). The shift brings the citizen (i) at the center of the piloting of public organization and (ii) opens new channels of involvement at the local level, bridging a transfer of responsibilities from *a passive* to more *active* involvement in the policy process. The new governance context builts on democratic citizenship, and public administrators serve and empower citizens (Denhardt and Denhardt 2000). Denhardt and Denhardt (2003, p. xi) in his work entitled "The New Public service: serving, not steering" argues that public administrators do not deliver customer service, but they deliver democracy. The "new public service" is built on several principles, such as (i) serve citizens, not customers, (ii) seek the public interest and value citizenship over entrepreneurship, (iii) think strategically, act democratically, (iv) recognizes that accountability is not simple, (v) serve rather than steer, and (vi) value people, not just productivity (Denhardt and Denhardt 2003, pp. 42–43).

Therefore, the position of the citizen has changed from acting as "user" that participates via its use of services, to "consumer," whose participation is limited to the moment of exchange with no regard to indirect aspects of it, to "citizen/co-producer," whose participation is a resource in the piloting of political and administrative activities (Callahan 2007; Vigoda 2003).

*Model of citizen participation in the policy cycle (*EUPAN 2008*):* Traditionally, policy-makers decided which services are to be provided, their characteristics, and relevant target for service. Structural shifts in public administration decision-making enabled active citizen/customers involved in the policy cycle. Such process required transparent and accountable procedures, democratic dialogue from one internal approach (focused on resources and activities) to an external one (focus on outputs and outcomes). It moved the attention from input to outputs and outcomes to meet the needs of citizens. As well, a shift from a classic cycle of "design-production-decision-evaluation" to an active engagement at each cycle's stage (as co-designers, co-deciders, co-producers, and co-evaluators) was seen (EUPAN 2008). The process paved the way of considering citizens at the center of every step of the policy cycle. There are many other models developed that emphasize the need for citizen participation to happen through co-design and co-production (Slay and Stephens 2013).

These levels are fundamental to the understanding of power relationships from the traditional settings of government power and control to the parameters required by governance and collaboration with citizens. What matters to citizens/customers are not the inputs or activities, but the outputs and particularly the outcomes of the policies that show what is happening in the community as the results of government intervention, the consequences of what a program or organization achieved. In the input and activities, citizens are involved as payer of the services and lesser in the outputs (the degree of achievement) and outcomes (impact). Across the stages of the policy cycle, the process is not limited just to "listening to users," to the collection of suggestions and complaints, but finalizing and using the listening in the operational process, to concrete inclusion in the service management (supply) and evaluation. The citizen acts as an active and competent user of public services, and such a process has an impact on the policy and management cycle as a whole. The citizens' role is different along the stages of the policy cycle. The European Primer on Customer Satisfaction Management publication (EUPAN 2008) highlights the changing role of the citizen/customer and its integration in each of the stages of the policy and service delivery-from planning to delivery and evaluation (Customer satisfaction management).

## Co-Design, Co-Decide, Co-Produce, and Co-Evaluate

*Design /co-design:* The design stage is essential as it defines the premises on the planning of the services delivery as well as a series of crucial decisions for services "production" as well as their operational evaluation. The design phase sets the phases of decision-making and production, but also monitoring and evaluation. The evaluation process was often perceived as a weak point because it lacks a "base," a reference to the quality of services before the introduction of innovation.

Primary premises sustaining the shift from the design to co-design requires from management to enable an open system that considers suggestions designed to improve policies, regardless of their origin. The process needs to involve staff and citizens/clients or other stakeholders, in the first early stage of design. It is a crucial step as it opens opportunity to identify needs and expectations to be answered, and that becomes, later, the main objectives of the public administration in the design of products and services.

*Decision/ co-decision*. Co-decision process is critical to the sustainability and quality of the decision-making process. Citizen/customers can benefit from the phase preceding the decision, gaining more knowledge and information through discussion and developing a stronger legitimacy and trust as well as satisfaction. Co-decision often takes place in the case of decentralization of some budgetary allocations to the local district, through the process of negotiation and determination budget spending allocation in the local community. Worth to mention is the case of participative drafting of the local budget in the city of Porto Alegre, Brazil that grouped community associations and stakeholders in organized meetings to define the local budget. Participatory budgeting is an innovative participatory practice that fosters participation and accountability and transparency in public financial matters. Another example of co-decision is the referendum for the adoption of formal decisions that are common in European countries.

*Production/co-production*: The stage of production and adoption begins after the taken decisions. Co-production is a complex term that implies a permanent or temporary involvement of different actors in various stages of the production cycle that is not always easy. The process tends to be perceived as an indispensable condition, in general, for certain specific services (e.g., social care, health and wellbeing, social inclusion, and employment). Actors involved could be the citizens' beneficiary of the services, as well as external suppliers (e.g., PPPs) or supply organizations in service delivery (e.g., nonprofit organizations).

Therefore, it is a process that involves citizens (as clients or recipients of services), either individually (e.g., parents or volunteers) or organizations (e.g., nonprofit organizations in social care, maintenance of parks, and community

safety). The efficacy of public services depends not only on the provider's performance but also the responses of the citizens, users, and wider community. However, there are some challenges, in doing co-production, so, it is important to make explicit agreements on responsibility and accountability of citizens as they can often be disappointed in the absence of a clear understanding of roles and responsibilities. Co-production, in more restricted use of terms, is an arrangement where citizens produce their services at least in part. The process refers to service delivery by citizens without direct state involvement, but with public financing and regulations (Pestoff et al. 2012).

*Evaluation/co-evaluation*: Evaluating policy and programs' achievements through citizen participation and perceptions open channels to assess results and improve quality through objective data derived from their perceptions and expectations. The approaches to evaluate the services are various, including questionnaires that explore the level of customer satisfaction or more active forms of dialogue have proved more effective than the regular questionnaires. Other modalities include committees, focus groups, or action groups that can be more inclusive.

The citizen contribution is constrained by individual experience and time. For example, the citizens might contribute with views, preferences, or policy priorities in the planning services. From a time perspective, participation may be permanent in the provision of ongoing services (e.g., collaboration in the library) or temporary (during times of particular need), or even on demand (e.g., volunteer in the fire department) (Fig. 2).

## State of Art: Rationales to Citizen Participation

In practice, the rationales (goals) behind of citizens' participation tend to answer the *why* question – why citizen involvement is essential and what to expect from it?

The first set of rationales, in the political philosophy (Dragos et al. 2008, pp. 20–21), connects the need for citizen participation to *legitimacy*, *accountability*, and *openness*. *Legitimacy* correlates in practice to the idea of enhancing trust and political confidence. A political system is legitimized either through the derivation of political choices from the authentic preferences of the community using a formal procedure or in virtue of its adequate capacity to respond to needs. Fung (2006) pointed out to citizen participation as a process to enhance governmental legitimacy. Legitimacy refers to the acceptance and support of the public actions by the community, which is bound to its decisions. The *accountability* is more pragmatic, providing instruments and means of political control, and thus making governance practice more responsive to citizens. While the laws on transparency and freedom of information enforce the openness of the local authority, the latter requires developing a sense of "nothing to hide," keeping updated the information regarding the functioning of public actions (*who*, *why*, *what* decisions). Therefore, citizen participation enables building trust and addressing citizen's confidence in government and legitimation of institution actions and decisions. It might increase the support for policy proposals, improving the quality of decisions by mobilizing external

**Citizen Participation: Rationales and Approaches, Fig. 2** Citizen participation in the policy cycle. (Source: Author's elaboration on Arnstein (1969), OECD (2001), NEF (2013), and EUPAN (2008))

knowledge and expertise, and enhancing the democratic legitimacy of decisions (Klijn and Koppenjan 2000).

The second set of rationales enforces the idea that citizen participation leads to *knowledge of needs* and *what matters* to citizens. It shows the consideration to citizens' values and how the needs and values of the community (Creighton 2005) are getting incorporated in the local decision-making. Creighton (2005) outlines that such a process permits the incorporation of citizens' concerns, needs, and values through two-way communication and interaction with the overall aim to reach better decisions that are supported by the public. The process enhances communication between citizens and government, which allows governments to obtain information about needs, desires, and attitudes and understand what the public wants. Public managers are responsible for satisfying users/customers of services economically, but also to ensure that creates something of "value" for citizens regarding long-term social outcomes (e.g., mental health, wellbeing, social care, and inclusion). The public authorities are required to do more with less cost, but above all, to increase their ability to address the needs of ever-changing social realities, which tend to become more complex and fragmented. The active participation can assure or enhance successful implementation of policy and better delivery of services while fostering long-term social community benefits.

The third set of rationales, which connects with the upper motives, reinforces the idea that participation in the policy process leads to gathering information and increasing quality decision-making and problem-solving. Creighton (2005, p. 17) sees public participation as a way of ensuring that government, before making a decision, have a dialogue with the community, as that decision impact the community in various ways. Citizen participation in local policy agenda builds consensus on goals settings to be achieved by the local authority. It facilitates the process of defining common strategic objectives and monitoring public service achievements. It allows gathering information that policymakers do not have and make better decisions (OECD 2001). Fung (2006) pointed out that public participation can make choices more suitable for real situations. Citizen views may add new information/or alternative solutions, regarding conditions or implementation of a program, service specifications, mismatch policy, and reality of the service issues. A strong argument sustaining the need for citizen participation in the policy cycle is crucial and adds value to the process in a meaningful way.

The OECD (2001) argues that engaging with citizens is "a core element of good governance." It could lead to (1) improving quality of policymaking by allowing the government to widen its sources of information, perspectives, and potential solutions; (2) facilitating greater and faster interconnection between citizens and governments; and (3) increasing accountability and transparency, with impact on representativeness and public confidence. In the same line of work, Creighton (2005) pointed out the various rationales of participation. It includes (a) improved quality of decisions; (b) minimizing cost and delay of making decisions; (c) building consensus that endows legitimacy; (d) more straightforward implementation of decisions with people's support; (e) reduce conflicts; (f) decision makers legitimacy and credibility for their decisions; (g) knowledge of needs and views on the issues and governments' operation; and (h) educating citizens. Similarly, Callahan (2007) pointed out potential benefits such as trust building, transparency, and government accountability for results.

Therefore, the participation appears as a strategic tool to narrow the gap in the relationships between local government officials and citizens (Table 1).

## Conclusion

In line with previous research, various approaches to participation (information, consultation, and active participation (OECD 2001) are in place. However, at a conceptual and practical level, a mapping of linkages between the methods of

involvement and rationales of participation needs more attention.

A significant shift is that the citizens' role has gradually changed from a simple user of services to that of active citizens. It is empowered with a voice to express preferences, critical needs, and desires and influences and shapes the policies and service delivery. Regarding practice, the approaches to participation are designed to be appropriate to particular objectives in context, and no single participation tool satisfies all at the same time. The engagement happens at different degrees (in scope, extent, and depth), aligning mostly with the local policy agenda pushing the need for the involvement to the fore. The desire for greater participation might move the discussion from low-level to a higher level in the policy decision-making. Not everything can be co-produced, for example. Depending on the issue at hand, reaching co-production takes a gradual process and requires time and commitment to the process on both sides – local government officials and citizens. Following the policy cycle of participation implies interdependence, which enables the effective public policy and quality decisions and ensures better implementation.

However, the role of the local government officials is central in this process, in determining what role can citizen play and influence the policy objectives at hand: who set, based on the nature of the issue, the appropriate approach to participation to reach the rationales behind the decisions. It requires proper judgement on the mechanisms and resources available to address the issue through the citizen's involvement. Once the process started, the citizens are one of the most significant assets (Slay and Stephens 2013) or resource in the development and practical implementation of local policies and services as they have lived experience and know local issues better than the government could ever do. In the process, the government officials' role is changing, becoming mostly one of a facilitator (Slay and Stephens 2013) rather than a producer, and there is a gradual shift of power in the relationships. It is worth understanding the different ways how the local government officials work with people because they see the purpose and end outcome of the participation. It is about, as well, clarifying the gap in the power relationships with the citizens and thinking about what changes are needed and what matters to the broader community.

# Citizen Satisfaction with E-Government Services in Malaysia

Ching Seng Yap[1] and Rizal Ahmad[2]
[1]Curtin University Malaysia, Miri, Malaysia
[2]Bandung Institute of Technology, Kota Bandung, Indonesia

## Synonyms

Digitalization of government services; Digitalized government services; E-government kiosks; E-government services; Government online services (GOS); Government to citizen services (G2C)

## Definitions

E-government services refer to public services offered to citizens and organizations via digital platforms such as kiosks, portals, websites, and mobile applications.

## Introduction

Malaysia is a country located in Southeast Asia and it is a member of the Association of Southeast Asian Nations (ASEAN). Malaysia comprises 11 states and 2 federal territories in Malay Peninsula, also known as Peninsular Malaysia or the west Malaysia, and two states (Sabah and Sarawak), and a federal territory – Labuan on Borneo Island makes up the east Malaysia. Malaysia has parliamentary democracy with a constitutional monarchy as the head of state and the prime minister as the head of government. Being a former British colony, the Malaysian government adopts the Westminster parliamentary system. The structure of the Malaysian government consists of the federal government of Malaysia, state governments, and local governments. The local governments are further divided into city hall/councils, municipal councils, district councils, and special/modified local governments. As of August 2020, Malaysia has 32 federal ministries, 13 state governments, 17 city hall/councils, 39 municipal councils, 95 district councils, and 5 special/modified local governments.

Digital government or electronic government (thereafter e-government) is one of the many transformational programs being undertaken by the government of Malaysia, which was designed to drive the country's transition from the "brick and mortar" economy to a developed digital economy. The vision of the public sector ICT is to become an inclusive digital government, which spearheads a citizen-centric delivery of all government services. The National E-Government Strategy of Malaysia is outlined in the Communication and Multimedia Blueprint 2018–2025, the Malaysian Public Sector ICT Strategic Plan 2016–2020, the Public Sector E-payment Strategic Plan, and the Online Services Index (OSI) Action Plan 2019–2020. A beta version of the Malaysian Public Sector ICT Strategic Plan 2021–2025 is currently in use. A dedicated department – the Digital Government, under the Malaysian Administrative Modernization and Management Planning Unit (MAMPU), Prime Minister Department, is responsible for planning, managing, and monitoring all e-government services throughout the country (Digital Government 2020). The e-government has been introduced and implemented in Malaysia since the year 1996. Initially, it provided government services through short message services, kiosks, websites and portals, and later on to using the mobile platforms. The types of e-government services being provided are mainly based on the government structure. For instance, the Ministry of Health would provide information concerning health issues such as the standard operating procedures in running businesses under the condition epidemic or pandemic. Almost all government organizations have their own websites to provide various degree of online services. Up to 2019, the provision e-government services to the public involves 741 participating public sector agencies at all levels, and these agencies operate 9102 government online services (GOS), which represent 87% of the total government services (SPLaSK 2020). Malaysia, under its 11th Malaysian Plan, had aimed for the 15th or better ranking in the Online Service Index (OSI) – one of the three components of the United Nation E-Government Development Index (EGDI) ranking, by 2020 but unfortunately, Malaysia only managed to occupy the 26th spot out of the 193 nations (UNEG 2020).

## Citizen Satisfaction with E-Government Services

Citizen satisfaction with e-government services is defined as a multidimensional construct consisting of different values such as efficiency, accountability, equity, and effectiveness in fulfilling their expectation (Welch et al. 2005). Service usage and satisfaction is one of the three pillars of Government and Electronic Mobile Services (GEMS) Maturity Index developed by United Nations Economic and Social Commission for Western Asia (UNESCWA). The level of citizen satisfaction with

e-government services is therefore one of the indicators that show the effectiveness of a government organization in providing public services to users through digital platforms.

In Malaysia, the initiative to assess and monitor governmental portals and websites and level of citizen satisfaction has been conducted through four different programs: a) the Malaysian Portals and Websites Assessment (MPWA) and this was carried out from 2005 to 2013; b) the Provider-based Evaluation (ProBE) was done from 2014 to 2016; c) the Malaysian User Satisfaction Evaluation (MUSE) was carried out from 2016 to 2017; and d) presently, the Websites and Government Online Services Assessment and Monitoring (SPLaSK) is being undertaken since 2018.

The MPWA involved in-house assessment of government portals and websites while the ProBE was a self-assessment of government websites. The MUSE consists of two parts: the MUSE survey as the first part and the GOS e-rating as the second part. The first part measures citizen satisfaction with government portals and websites and the second part measures citizen satisfaction with GOS. In developing the SPLaSK in 2018, the e-government's aims were, firstly, to enhance its services and achieve the Online Services Index (OSI) ranking of the 15th by 2020, secondly, to increase the level of online government service provision to 90% of all its services, and thirdly, to improve the level of citizen satisfaction to 80% or better. The SPLaSK consists of three parts – assessment of websites and GOS, assessment of citizen satisfaction, and profiling of government websites. The first part contains seven dimensions that are used to assess and monitor government websites and GOS. These dimensions are ease of use, quality of content, privacy/security, responsiveness, accessibility, reliability, and design. A total of 15 measuring items for websites and 16 measuring items for GOS are used in the assessment. The second part is to gauge the level of citizen satisfaction with e-government, and for this purpose, the GOS e-rating is used. The rating has four dimensions with seven items and each item is measured with the use of the five-point Likert scale. The four dimensions are ease of use, quality of content, responsiveness, and web design. The third part of profiling government websites involves the use of criteria of availability of mobile apps, statistics of online services transaction, and number of GOS provided. In spite of the apparent comprehensiveness of SPLaSK, this survey does not include measuring the determinants and consequences of citizen satisfaction with the e-government, and this had made it rather difficult for managers to identify factors, which could be used to predict citizen satisfaction or to determine whether satisfaction may lead to citizens to continue using e-government services.

In the case of MUSE, the findings of survey reports were meant to be shared with all stakeholders but unfortunately, those reports were not made available to the public. Only the 2015 summary report of MUSE was made available to the public on the Internet by the Malaysia Digital Economy Corporation (MDEC) – the government agency, which managed the survey in 2015.

That said, a number of government agencies do share survey reports on their respective websites. Since 2018, the responsibility of conducting MUSE survey has been transferred to MAMPU, which consequently become and legal owner of the MUSE survey reports. MAMPU developed and made available an online interactive tool known as the SPLaSK Dashboard (SPLaSK Dashboard 2020). The SPLaSK dashboard is currently used to monitor and assess the websites of 246 public sector agencies, and 863 GOS, representing 96.1% of government services. Moreover, citizens may view the satisfaction performance of each agencies' website and the GOS using the SPLaSK Dashboard. In a survey of 547,004 respondents, 90.13% of them were found to be satisfied with using e-government and this is an indication of the citizen satisfaction.

On the other hand, academic researchers in Malaysia tend to share reports of their research findings on citizen satisfaction with e-government services in journal publications, for instance, Baharon et al. (2017) and Yap et al. (in press). However, these studies only cover a limited range of e-government services and they involve using smaller sample sizes. There had not been publicly available reports from consulting firms or practitioners regarding citizen satisfaction with e-government services in Malaysia.

**Citizen Satisfaction with E-Government Services in Malaysia, Table 1** Citizen Satisfaction from Different Reports and UNEG Ranking in Malaysia

| 2020 | – | – | – | – | 4.42/7 | 47/193 |

*Note*. - Not applicable; *NA* not available; MGPWA (2005–2013), ProBE (2014–2015), ProBE and MUSE (2016), MUSE (2017), SPLaSK (2018 to present); MGPWA and ProBE denote % of evaluated websites that are 4- or 5-star; MUSE and GOS e-Rating denote % of satisfaction score on "satisfied" and "very satisfied"; UNEG Ranking is based on EGDI consisting of OSI, HCI, and TII

For further information and for the purpose of comparison, Table 1 summarizes the overall satisfaction of citizens with e-government services in Malaysia. The information had been collated from government reports and findings of academic studies, as well as based on the E-Government Development Index (EGDI) of the United Nations E-Government Survey (UNEG) ranking published by UNDESA.

## Conclusion

The e-government of Malaysia is a means to provide a better accessibility to public services and to enhance the delivery of needed services to citizens of Malaysia. The priority of the government of Malaysia should therefore be to ensure that all government departments and their agencies provide most if not all their services online and put in more efforts in encouraging the use of online services. This would need the development and implementation of strategies that will increase the rate of usage of online services as well as the level of satisfaction of citizens in using those online services. In its effort to realize a higher level of usage and satisfaction, all e-governmental portals and websites should ensure that the citizen satisfaction survey reports are made available on their respective websites for all users to understand the areas which would need further improvement or even a redevelopment. It is also highly recommended that all government websites use appropriate web 2.0 tools, such as discussion forums and social media to facilitate interactions among users and between the government departments and users. Contents of those forums could potentially be used to identify gaps in services or unmet needs and provide clues on future expectations of citizens.

# Citizen Satisfaction with Government Services in Japan

Yu Noda
Doshisha University, Kyoto, Japan

## Synonyms

Accountability; Performance measurement; Responsibility; Transparency; Trust in government

## Definition

The state of being satisfied with public services; citizen evaluation and rating for performance measurement of government based on citizen needs for public services, public administration, and politics; citizen thoughts that can be a policy tool in the decision-making process; policy outcomes from citizen view as democratic values of responsibility.

## Summary

The concept of citizen satisfaction is used as a policy tool to collect and analyze citizens' opinions and reflect them in public policy's decision-making process. Compared to statistical data, the satisfaction index can directly be obtained from the citizens and be used as an outcome index of performance measurement. Japanese local governments manage city plan in a strategic manner by analyzing the citizen satisfaction index. Some localities have tried to measure the improvement of services, including welfare, infrastructure, and counter services according to citizen satisfaction. Governments put in substantial effort to identify the determinants of citizen satisfaction, such as service performance, citizens' expectations, and officials' attitudes.

However, the satisfaction index does not necessarily correlate with the objective statistical data of government reports since the index is generated from the citizens' subjective answers. This problem, based on the difficulty of the citizens' ratings, arises from their misunderstanding of policy issues, subject matters, effects, institution of government, and public administration. In Japan, it is also difficult for citizens to differentiate among the public services provided by the various kinds of governments such as municipalities and prefectures.

Although Japanese localities have a wide range of responsibilities toward public services compared with other countries, citizens have very high expectations from government services without any knowledge of the priority of services in the context of financial deterioration. The key solutions to this problem are the improvement of citizens' education and building of trust toward the government by encouraging dialogue between public officials and citizens.

## Introduction: Citizen Satisfaction as an Index of Citizen Needs

Citizen satisfaction surveys on public services can give public officials the feedback they need to improve services and can function as citizen-

government feedback loops, benchmarking localities, engendering trust, providing transparency and accountability, ensuring effective budget allocations, and motivating public employees to improve the society (Morgeson 2014, 36–47).

The local government structure in Japan is a dual representative system in which a public administration chief such as a mayor or a governor and local representatives are elected by the citizens, with the chief having the authority to make and submit municipal ordinances and budgets to be implemented by the local representatives. When considering ordinances and budgets, particular attention needs to be paid to identifying and satisfying local community needs. As Japanese localities have a wider range of service responsibilities than municipalities in the United States and other countries, citizens tend to rely on the government more and have higher expectations; therefore, there is increased government focus on attending to the needs of the local community. However, identifying these needs precisely can be difficult as they are usually very ambiguous, scattered, and unsystematic (Pekkarinen et al. 2011).

To determine the community's opinion of public services, the government uses a survey to directly ask citizens how satisfied they are with the services provided, with citizens rating the services on a 4- or 5-point-scale; 1 = "Very dissatisfied," 2 = "Dissatisfied," 3 = "Neither satisfied nor dissatisfied," 4 = "Satisfied," 5 = "Very satisfied." The survey responses are then amalgamated and an overall citizen satisfaction index compiled.

This is why Japanese localities use the citizen satisfaction index to address public service shortfalls. Since the late 1990s when new public management emerged in Japanese local governments, localities have utilized the citizen satisfaction index to enhance accountability and develop citizen-government loops.

Japanese public administration uses the index for three main reasons. The first is to find out how the local community thinks about a specific service or facility. For example, Machida city used a satisfaction survey about after school childcare services to analyze overall childcare service satisfaction as well as to determine the improvements needed in instruction and facilities (Machida 2015). The Ministry of Land, Infrastructure, Transport, and Tourism (MLIT) conducted a user satisfaction survey on the environment, traffic, and highway, national, prefectural, and municipal road construction (MLIT 2003) to gain accountability for project necessity and to justify to the central government the budget needed for infrastructure projects such as roads, bridges, and convention facilities.

The second reason for the user surveys is to ensure constant improvement in public officials' attitudes. For example, Sayama city used the citizen satisfaction index to improve their over-the-counter services. The citizens were asked to comment on the service quality of public servants in terms of attitude toward citizens, speed of resolution, dedication to finding a solution, and adequacy of explanations (Sayama 2017).

The third and most popular use for citizen satisfaction surveys by Japanese local governments is to measure the performance of programs included in the city's comprehensive plan. In Japan, as the comprehensive plan has many programs from many policy fields such as social welfare, construction, education, and disaster prevention, performance measurement is essential to control the plan and ensure the municipal budget is being spent wisely on such areas as social welfare programs that cover elderly welfare, childcare, and welfare for the handicapped. Kiyosu city, for example, uses the citizen satisfaction index as outcome indexes for all its 37 programs and seven policies to achieve their 2- or 3-year targets (Kiyosu 2016). The city developed the plan in the city plan council and sought advice from citizens, researchers, chamber of commerce members, students, community organizations, Nonprofit Organization (NPO), and public officials. Further the city established the Kiyosu public administration reform committee, which included citizens, to evaluate program performances based on a citizen satisfaction analysis of each program.

In this way Japanese localities maximize the use of citizen satisfaction to enhance accountability and drive inclusive democracy.

## Gap Between Subjective and Objective Measurements

While citizen satisfaction surveys are easy to use to gather information about public service performance, accountability, and service outcomes, they do not often elucidate the causes and determinants for the satisfaction degree. By analyzing the satisfaction indexes and program importance or an "Importance-Performance Analysis," it is possible to identify high priority programs that have low community satisfaction (Van Ryzin and Immerwahr 2007). Several Japanese municipalities such as in Himeji city (Himeji 2016) used an Importance-Performance Analysis to focus on budgeting for high priority programs but were unable to determine the causes for the variable levels of satisfaction. Although governments have put substantial effort into identifying the citizen satisfaction determinants, they have rarely used regression analyses to estimate the causes for the levels of citizen satisfaction because of the difficulties of explaining technical terms to citizens.

It has generally been assumed that satisfaction levels are affected by performance, service expectations, attitudes, and demographic factors, with overall performance being believed to have the most significant impact on satisfaction levels. However, improving performance has not always led to the expected satisfaction improvements. It has been found that objective measures based on government statistical reports do not always correlate with the more subjective citizen satisfaction index (Parks 1984; Kelly and Swindell 2002; Swindell and Kelly 2000). This gap is related to the Expectancy-Disconfirmation Paradigm, within which negative effects emerge when expectations exceed actual experience (Oliver 1980).

Research has found that the reasons for this gap are generally citizen misinformation or lack of understanding. Kelly and Swindell (2002) determined two types of errors that citizens make when evaluating public services: attribution errors (Lyons et al. 1992), and assessment errors. Attribution errors mean that citizens do not accurately recognize the service provider; in Japan, many citizens are not aware of who provides which service as similar services are provided by municipalities, prefectural administrations, as well as by the central government.

Assessment errors mean a citizen gives an incorrect rating based on their own experience which may not be necessarily correlated to the government's objective statistical data. Citizens often misunderstand the outcomes of public services because of the difficulties in accessing some public services, their own experiences, indifference, prejudice, or the influence of word of mouth. As Japanese citizens are not usually interested in the public affairs and politics that happen far from them; they tend to regard many public services as commonplace and therefore have overly high expectations of government services without thinking about service priority and fiscal restraint. In these situations, therefore, the citizens' expectations of the public services and the actual public service performances are often misaligned.

## Nonlinear Effects of Performance to Satisfaction

As this misalignment can differ depending on the program and the citizen's closeness to the program, it is important to reconsider the relationship between a citizen's recognition of service performance and citizen satisfaction. Previous public administration satisfaction studies have assumed that there was correlation between service performance and citizen satisfaction; however, when service performance increases, citizen satisfaction with the service does not necessarily show a commensurate linear increase. This nonlinear effect means that subjective public service performance rates differ depending on whether the citizens have higher or lower performance perceptions and whether they feel satisfied or dissatisfied. Marketing field research (Anderson and Mittal 2000; Mittal et al. 1998) has examined the nonlinear, asymmetrical effects of related variables such as service performance and satisfaction using prospect theory (Kahneman and Tversky 1979) and found that individuals decide on their

level of satisfaction based on subjective reference points, or in other words, their expectations.

Unlike marketing research, very few public administration studies have focused on the nonlinear, asymmetric effects of performance. James (2009) found that reducing dissatisfaction was significantly easier than improving satisfaction and that asking residents about a specific, clearly, service such as refuse collection had a stronger impact on satisfaction with nonlinear relations than asking for opinions about overall services.

Noda (2014) also found that there were different effects depending on the levels of governments such as municipalities and prefectures. Prefectural services in particular, such as establishing and maintaining roads, were found to have strong nonlinear effects from performance to satisfaction, with the high satisfaction found for some high performance areas diminishing as performance improved, called "diminishing sensitivity" in prospect theory, and vice versa.

In addition, as municipalities are closer to residents' day to day life, the citizens are relatively aware of their activities and services and have a closer sense of ownership; however, as prefectural administrations tend to be more remote, the citizens in the prefecture are less aware of the services and feel more remote from any sense of shared responsibility. Therefore, there is a distribution ranging from the citizens who have a good knowledge of the performance of prefectural services such as road maintenance, who may tend to give better evaluations; the people positioned on the x-axis (y-axis is satisfaction), to those who are less aware of the services, who may tend to give poorer evaluations. These differences in prefectural evaluations can result in nonlinear effects even for obvious services such as road building and maintenance.

Therefore, the nonlinear effects that arise because of the gap between the subjective and the objective are a direct result of citizen misunderstanding about public policy issues, public administration, and public institutions. Many citizens who are unable to understand the intent of a policy issue often doubt the veracity or necessity of the policy. If a well-informed citizen rates a service such as building roads by the prefectures as better than expected, increased satisfaction rates may indicate improved performance. However, for public services taken as commonplace, citizens may doubt the productivity of the public officials; therefore, the satisfaction may relate more to the ability of the public servant, rather than the expectation of the policy; that is, the individual recognition of performance acts as the background to the level of satisfaction expressed by the citizen.

There are two main causes for the nonlinear effects in Japanese satisfaction studies: lack of clarity about public services, and confusion as to the specific responsibilities of the local governments such as municipalities and prefectures. If citizens had adequate knowledge about public services, this would have a strong linear effect from performance to satisfaction except for the effects by diminishing sensitivity. However, if the service is provided by the prefectures, nonlinear effects would be more likely because of the varying performance interpretations. As prefectural administrations are often far from residents, individual recognition of the quality of their services is different from the recognition given to municipal services. Therefore, it is necessary for prefectures to ensure that their citizens know about their specific programs and services to increase the reliability of the citizen performance satisfaction index.

## Conclusion

Japanese localities use citizen satisfaction indexes to improve programs while maintaining fiscal restraint. However, while this index is of some use, there has been little assessment of the gap between the subjective and objective measures or the nonlinear performance effects of the satisfaction.

To deal with this gap, trust in the government needs to be the underlying premise for satisfaction. Although satisfaction is one of the factors of trust, trust promotes satisfaction. When the psychological distance between the government and the citizens is less, the citizens tend to be more satisfied with the government services than those who feel more remote from the government. As

very small localities such as villages are very close to the citizens, there is generally a higher trust in the local government than in the larger governments. Regarding policy capabilities – which Dahl called "system capacity" (Dahl and Tufte 1973, 20) – as larger governments generally have greater policy resources than smaller governments, they may engender greater trust; however, in Japan, as all local governments provide a wide range of services based on related central government laws and regulations, securing a closeness to the residents is more intensive factor to trust in government than citizens' recognition on the policy capabilities. As prefectures are wide area governments, they are psychologically more distant from their residents than municipalities. Therefore, citizen trust in the prefectures is lower, which is expressed as lower satisfaction because the citizens are often unsure as to the performance either because of a lack of knowledge or citizen indifference, which causes nonlinear effects between objective service performance and subjective citizen satisfaction levels.

As governments need to be fiscally responsible, spending a great deal on service improvements based on citizen satisfaction is not an effective solution. Local governments, therefore, need to build trust by enhancing public administration transparency and educating the citizens about their ownership of their government. To do this, public officials need to encourage dialog between citizens at public hearing, meetings, and through effective public relations. Prefectural officials, in particular, need to put greater efforts into advising the citizens of their activities and programs through public hearings and by educating the public in appropriate expectations and service performance under financial restraints. Further, public officials need to be aware of the nonlinear effects related to the citizen satisfaction rate so that they can develop better targeted programs to increase citizen satisfaction with their overall performance.

# Citizen-Administration Relationships

Jean-Patrick Villeneuve
Università della Svizzera italiana, Lugano, Switzerland

## Synonyms

State citizen Interactions; State citizen Transactions

## Definition

Citizen-administration relationships refer to the various ways in which individuals and public sector organizations interact. This includes in-person interactions (e.g., at the counter) and mediated interactions (e.g., Internet) for transactional relationships. It also includes the less tangible relationships involving the citizen not as direct beneficiary of a good or service but as general stakeholders in public sector relationships.

## Introduction

The relationships between citizens and administrations take many forms. These forms are defined by the characteristics attributed to both the citizen and the administration within a given sociopolitical system – capabilities, objectives, independence, etc. These attributes will, consequently, define the possibilities of the relationships and define the nature of it. The concrete aspects of the relationship, its direct (in person) or mediated nature, its formal or informal dynamics, will all be derived from these systemic characteristics.

The relationship between citizens and administrations has to be understood as a separate and subordinate dynamic to the political relationship that links the citizen to the State and to the polity as a whole. While the all-encompassing political relationship has an influence on the administrative relationship, the latter has a number of specificities that make it an object of study of its own.

This contribution outlines the three main paradigms of the citizen-administration relationship: the traditional or Weberian model, consumerist model, and the participatory model. Each of these models has different conceptualizations and priorities for the understanding, planning, and managing of these relationships.

## Traditional Model

In his book *Economy and Society*, Max Weber (1921) presents the main characteristics of public sector organizations and the roles and attributes of citizens in their interactions with them. In this traditional model, public administrations are characterized by concepts of professionalism, hierarchy, and unity, while the citizen is in a relationship that is characterized by notions of distance and authority.

The notions of distance and authority are the consequence of the characteristics of traditional public organizations that have the legal prerogatives and expertise as well as the professional resources to create and maintain an asymmetrical relationship with the citizen. The distance between the administration and the citizen gives the former a special position, occupying its very own sphere of action disconnected from its external environment. For Chevallier's (2002: 348) citizens are placed in a situation of radical inferiority and dependence and are forced to submit to a mysterious, remote, and omnipotent authority, over which they have no power (This author's own translation).

This particular type of relationship is top-down and defined in all aspects, from service and policy definition to their delivery by the admiration. In the relationship, the citizen has an obligation of compliance and the administration one of information. The recourses of the citizen are limited to the legal prescriptions that limit the organizations authority. The citizen has a passive attitude and a passive reality. The ability of the citizen to have an influence, aside from the full respect of his legal

prerogatives, is to be found in his political rights to be asserted at election times.

This model is rooted in the legalistic tradition of the State. It is structured around rules and regulations, their definition, and strict application. The relationship is defined based on the possibilities detailed in the legal framework. The administration is bound by these rules and so is the relationship. Other considerations, taking into account either the nature or specificity of a relationship, or the particular needs of citizens, are secondary. The citizen is understood as a category and not as an individual. Each citizen is to be treated the same way, thus respecting the fundamental construct of the equality of treatment.

This type of relationship is characteristic of the *regalian* functions of the State such as the collecting of taxes, border defense, and diplomatic affairs. With the development of State services in the post-WWII area, and the increasing criticisms leveled at the traditional model (rigidity, inefficiency, etc.), the relationship between citizens and administration transformed itself and morphed into a more balanced exchange.

## Consumerist model

The criticism leveled at the traditional model led to the development of various mechanisms of arbitration between citizen and organizations. They were developed in large part to provide more room for citizens to be heard – development of user association and various para-administrative associations focused on rebalancing the relationship. While these developments have changed the relationship, it is the development of New Public Management (Hood 1991) that introduced a clear break with the fundamental legalistic logic of the traditional system.

This approach introduced the language and tools of the private sector relationships between a consumer and a firm and attempted to use them to reframe the traditional model of public sector relationships. The operations of public administrations and the expectations of citizens were to be modified accordingly.

The administration was now to be put under the pressure of competition, whether vis-a-vis other administrative units, the private sector of the non-profit sector. The objective was to develop a more efficient and more reactive public service. This was a clear move away from the notion of distance and disconnect found in the traditional model.

The administration now needed to develop the ability to respond to citizens' demands. A specific focus was put on individual needs and on the importance of being reactive to these needs and desires. Corollary to that, the citizen was now imbued with a greater voice (Hirschman 1970) and with the ability to make decision through an increasing level of choice presented to him by administrations. This choice can be in selecting the organization offering the service, but more often the various modalities of using a service that the state is the only one to provide (e.g., passports, drivers' licenses). While the center of the service would not change (a passport is a passport), the modalities to obtain would now be tailored to the various demands of citizens (longer opening hours, online platform, easy to understand forms, etc.). Key evaluation of the success of the relationship was no longer to be the mere respect of rules and regulation, but the satisfaction of citizens, with the use of the satisfaction survey.

The relationship is one of adaptation and of individuality. The notion of equality of treatment is no longer the sole conceptual lens for analyzing the relationship. The relationship was not defined uniformly for all citizens but was to be tailored to the individual needs. This tailoring was made possible on the one hand by the development of technology, notably ICTS, making possible the individualization of services at a lower cost. A second aspect that makes this possible is the end of the "professionals know best" approach, thus further legitimizing the voice of the citizen vis-à-vis the notions of professionalism defining the traditional approach.

The relationship was now more balanced, but the choices presented to the citizens were those decided and framed by the administration and not by citizens themselves. This model was to be criticized for its conceptual limitations but also

for the way in which it had limited the nature of the relationship.

## Participatory model

Democratic governance has taken yet another approach at defining the citizen-administration relationships (Peters 1996). While New Public Management perceived the user of public services as a consumer, like that encountered in the private sector, democratic governance tried to reinvent the citizen into a citizen-partner, an active participant to the policy development, policy management, and delivery of public services.

In this relationship, the dynamic is multilateral with the citizen and the administration sharing parts of the responsibility for the overall success of the encounter.

The notions framing the relationship are those of participation, transparency, and accountability. This approach is based on the development of a much more complex environment. One in which the administration cannot, by itself, and on its own terms, control the relationship and ensure its success.

In this environment, part of the information and knowledge is to be found outside the organization. It is therefore important to involve other actors, be it the individual citizens or associations and nonprofit organizations in identifying and addressing issues and delivering services. The administration becomes the center of a network more than the sole purveyor of administrative services. The logic of relationship becomes the central elements for public administrations.

The participation of citizen, as described by Arnstein (1969), has given voice to citizen even if that voice is not always listened too, or simply used as an alibi by organization. But it has led to more involved relationships, including the development of the coproduction of services (Alford 2009).

Transparency, the opening of internal dynamics of the organization to outsiders, has represented a sea change for administrations. Embodied most clearly in access to information laws, these prerogatives allow citizen to request information or document from administration. This dynamic, along with other openness and transparency innovations, has helped rebalance the power dynamics of the relationship by providing citizen with more information on the substantive policy discussions but also on the way in which the administration functions.

The logic of accountability has led to similar empowerment of the citizen. It recognizes the importance for the relationship of the citizen as a member of the political whole, a stakeholder in the development of harmonious and effective relationships.

In this case, the importance is no longer exclusively put on the respect of rules and regulations, nor is it on the satisfaction of citizens, but rather on their involvement in the processes. These processes serve in fact a higher objective that of ensuring the continuous development of an active and dynamic democratic environment. The relationship is no longer purely instrumental but has an intrinsic value.

## Conclusion

Each model of the relationship between administrations and citizen, the traditional model, consumerist model or participatory model has all defined the administration and the citizen in different ways. Each approach is rooted in different academic traditions and underline different priorities for the State as a whole. For the relationship, these different aspects have entailed different priorities and different dynamics, whether it be top-down or bottom-up.

These three modes of interaction between citizens and administrations have emerged one after the other on the conceptual timeframe. But, all three are present in today's framing of the interaction between citizens and administrations. For each relationship, part of the traditional model, part of the consumerist model, and part of the participatory model are used and applied by organizations in their day-to-day operations. The conceptual clarity of concept is embodied in a much messier way in real-life interaction. These models have been superimposed with – depending on the

circumstances – one being a bit more present than the other.

## Concept

According to Merriam-Webster Dictionary (2019), public policies are government policies that affect the whole population. Public policies are defined as sets of programs, actions, and decisions made by governments (national, state, or municipal) with the direct or indirect participation of public or private entities that aim to ensure a certain right of citizenship, guaranteed in the Constitution for a particular social, cultural, ethnic, or economic segment.

Despite the diverse views on citizenship, for this article, the broader concept that citizenship is "membership in a community" has been adopted, according to the Merriam-Webster Dictionary.

For Dominique (2017), the concept of citizenship is formed by three essential elements or dimensions: The first one is citizenship as legal status, defined by civil, political, and social rights. The second considers citizens as active political agents, and the third refers to citizenship as a member of a political community that provides a distinct source of identity. Therefore, citizenship deals with the formal status of citizens, constituted by their rights and duties and by the creation and reproduction of political and sociocultural identities of community members.

## Introduction

The first cities arose in Sumer, Egypt, the Indus River Valley, Shang Dynasty of China, and Mesoamerica and possibly also independently in Peru, due to the development of control over food cultivation and production and the domestication of animals (Lynch 1960).

With the advent of the Industrial Revolution, the process of migration from the countryside to the cities promoted an essentially urban society. According to the United Nations (UN 2013), in 2010, more than half of the world's population lived in cities, and this figure by 2050 will be over 70%. In addition, 80% of the world's urban population will live in developing regions, especially cities in Africa and Asia.

For Haub (2009), there is a big difference in how populations experience "urban/rural" differences. For example, in developing countries, many urban dwellers live in settlements with little access to transport, limited electricity availability, and little or no access to clean water or sanitation.

On the other hand, in developed countries, rural people often have the same access to services and amenities as urban dwellers, for example, excellent road connections, communications, cable television, and the Internet, thus making the urban/rural difference less relevant.

Cities increase the possibilities for economic development, innovation, and social interaction. They are the center of cultural, social, and political activity, and, in order to be sustainable, they must provide the structures and services that enable the well-being and productivity of their inhabitants (WHO 2007). In the case of older people, there is a need to empower the surroundings to provide them with support and empowerment, compensating for the physical and social changes associated with aging. Making cities friendlier to older people is a necessary and logical response, which enables the well-being and contribution of older urban dwellers to be promoted, while keeping cities prosperous (UN 2002).

This chapter presents the need for city managers to develop public policies that allow the older people citizens the full exercise of citizenship.

## Aging and Citizenship

For gerontology, human aging is a phenomenon that should be understood at biopsychosocial levels (Paúl and Ribeiro 2012; Fernández-Ballesteros 2009; McMullin 2000). At the biological level, it is characterized by the loss of physical capacity and the increase in diseases, which is called senescence. At the psychological level, changes in intellectual and motivational activities are associated and at the social level by the change in social status caused by the changeover (Paúl 2005).

According to Fernández-Ballesteros et al. (2013), only 25% of the aging process is the result of genetic aspects, and 75% are influenced by the environment and behavioral aspects. Thus, individual aging is not a random phenomenon, but the individual is an active agent in its determination.

The concept of active aging was advanced in 2002 by the World Health Organization (WHO) in a conception that, in addition to health, socioeconomic, psychological, and environmental aspects, acts as predictors of aging with quality of life (Ribeiro and Paúl 2011; WHO 2007). Active aging is an emerging WHO international policy approach that focuses on the social determinants of health (Fig. 1), such as economic determinants (income, social protection, decent work opportunities), social determinants (social support and education), personal determinants (biological, genetic, and psychological factors), behavioral determinants (healthy lifestyle, active participation in health care), physical environment (accessibility to transport services, housing, and safe neighborhood), social and health services (health promotion and prevention of accessible and quality diseases), and the cross-cutting determinants of culture and gender (Hutchison et al. 2006; WHO 2002). For WHO (2007), these determinants must be viewed from a life cycle perspective that recognizes that older people are not a homogeneous group and that individual diversity increases with age.

Paúl et al. (2012) understand that the quality of life among older people is largely determined by the ability to maintain independence and autonomy, if not physical, at least psychological and social, that is, the ability to decide and control their lives.

For the United Nations, the concept of active aging refers to "The process of optimizing health, participation and safety opportunities with the aim of improving the quality of life as people age" (UN 2002). For WHO, the word "active" refers to continued participation in social, economic, cultural, spiritual, and civil issues, not just the ability to be physically active or to be part of the workforce.

The various organizations working on this issue have actively encouraged older people to organize themselves to be a force that can influence the design and implementation of policies that affect them (UN 2007).

## Public Policy and Active Aging

The active aging approach is based on the recognition of the human rights of older people and on

**City Management: Public Policies and Citizenship from an Older People Population Perspective, Fig. 1** The determinants on active ageing. (Source: Adapted by WHO (2002, p. 19))

the principles of independence, participation, dignity, care, and self-realization established by the United Nations (Ribeiro and Paúl 2011).

With this new paradigm, strategic planning of public policy for older people no longer has a needs-based approach (which considers older people as passive targets) and becomes a rights-based approach, which allows for the recognition of the rights of older people to equal opportunities and treatment in all aspects of life (WHO 2002).

Based on the premise that the aging process is a phenomenon with multiple implications in the various spheres of social life, the promotion of better quality of life for older people requires the integrated and complementary action of the various public actors and civil society. Such scenario points to the need for public care policies for them that include, among other concerns, diagnostic mechanisms that guide decision-making by investors and public managers dealing with the theme, enabling the strengthening of the care network for the older person and the promotion of the quality of life of this population.

For WHO (2002), the active aging policy framework requires action on the three pillars of the active aging policy framework (health, safety, and participation) and is based on the principles of independence, participation, care, self-fulfillment, and human dignity (United Nations) (Fig. 2). The decisions are based on the interpretation of how the determinants of active aging influence the way populations and individuals age.

Walker and Maltby (2012) identify the key events in defining active aging approaches in Europe. Between 1993, European Year of Older People, and 2012, European Year for Active Ageing and Solidarity between generations, with the Lisbon Treaty (2000) halfway, the evolution of an European political discourse on active aging has been observed which comprised two contrasting models: In the first phase, the emphasis on a narrow economist or productivist approach focused primarily on employment policy and extending the retirement age. In contrast, there is a second, broader approach supported by WHO and the United Nations articulated at the European Year

**City Management: Public Policies and Citizenship from an Older People Population Perspective, Fig. 2** The three pillars of a policy framework for active ageing. (Source: Adapted by WHO (2002, p. 45))

for Active Aging and Solidarity in 2012, which aimed to help create better employment opportunities and working conditions for the growing number of older people in Europe, so that older people play an active role in the society and have a healthy aging (European Commission 2010).

Regarding public policies directed at the elderly population, a new political declaration and a new action plan were adopted during 2002, during the Second World Assembly on Aging held in Madrid, which is guiding the adoption of normative measures on aging in this century (Camarano and Pasinato 2007). This plan is based on three principles:

- Active participation of older people in the society, in development, and in the fight against poverty
- Promotion of health and well-being in old age: promotion of healthy aging throughout life
- Creating an enabling and conducive environment for safe aging that promotes intergenerational solidarity

## Cities for All

From the perspective of the concept of active aging, WHO has conducted a worldwide survey of 35 cities across 5 continents involving governments, nongovernmental organizations, and academic groups to develop a city mobilization mechanism to become friends with the elderly. From this initiative emerged the "Global Guide to Older Cities" (WHO 2007).

The premise underlying the concept of the "age-friendly city" is that an age-friendly city is not simply friendly to older people, but to everyone, especially the most vulnerable groups:

> (. . .) Unhindered buildings and streets increase the mobility and independence of people with disabilities. A safe neighborhood allows children, women and the elderly to feel confident about going out and taking part in social and leisure activities. Families are less affected by stress when their older members have the community support and health services they need. The whole community benefits from the participation of older people in voluntary or paid work. Finally, the local economy profits from the clientele of older adult consumers. (WHO 2007, p. 6)

The guide aforementioned provides a comprehensive overview of the age-friendly features. In each city 8 (eight) topics were explored in the focus groups (Fig. 3). Topics included structures, environments, services, and policies that reflect the determinants of active aging (WHO 2007, p. 9):

- The first three topics investigated were public buildings and open spaces, transportation, and housing.

**City Management: Public Policies and Citizenship from an Older People Population Perspective, Fig. 3** Age-friendly city topic areas. (Source: Adapted by WHO (2007, p. 9))

- Three other topics reflect the different aspects of the social environment and culture that affect participation and mental well-being: (i) Social participation concerns the engagement of older people in recreational, social, cultural, educational, and spiritual activities; (ii) civic participation and (iii) employment focus on citizenship opportunities, voluntary and paid work and are related to the economic determinants of active aging
- The last two topics, communication and information and community support and health services, encompass social environments and determinants of health and social services.

With the publication of the guide, several initiatives have sprung up around the globe, and WHO has created the "Global Network of Age-Friendly Cities and Communities," where cities wishing to be part of the network must adhere to a process of diagnosis, planning, implementation, and evaluation with a focus on continually improving their policies and programs to become "age-friendly" (Fitzgerald and Caro 2014; WHO 2011; Fig. 4).

For Buffel et al. (2014), cities need a more integrated strategy in operationalizing the "age-friendly" concept. For the authors, one solution would be to make the concept "age-friendly" as a central part of policy formulation to promote sustainable urban development in its environmental, social, and economic dimensions.

## Sustainable Development and Active Aging

According to Jara (1998), the days of development driven by the centralizing and exclusionary state are apparently coming to an end. New sustainable development strategies are beginning to introduce concepts of resource finitude, whether natural or financial, space enhancement, social justice and citizenship rescue, democratic and

**City Management: Public Policies and Citizenship from an Older People Population Perspective, Fig. 4** Cycle of the WHO Global Network for Age-friendly Cities and Communities. (Source: Adapted by WHO (2011, p. 1))

participatory public management, self-management and local democracy, institutional partnership, and co-responsibility.

The dynamics of the population aging process is a fundamental issue for city management, requiring public policymakers a central challenge for the development of sustainable and humanized solutions. One of these challenges would be to ensure that the development process takes place based on principles capable of guaranteeing human dignity and equity among age groups in sharing resources, rights, and social responsibilities (UN 2002).

The population aging generates greater demands and costs to the social health system, jeopardizing the sustainability of social protection systems, since informal support to the older people population declines, given the changes that occur mainly in the family structure. In addition, migration, urbanization, the transformation of the family into smaller and fickle families, lack of access to technologies that promote independence, and other socioeconomic changes can lead the elderly to isolation, depriving them of significant economic and social functions and also weakening their traditional sources of support (UN 2002).

For Sousa and Lima (2007), the weakening of the family in supporting its older members stems mainly from the increased geographical mobility and the inclusion of women in the labor market. For the authors, rural-urban and urban-urban migration of working-age individuals leaves older people to live far from their children. In the case of working women, according to the authors, there is a need for reorganization of family roles and, especially, the use of community support institutions.

In developed countries, population aging has occurred in a favorable socioeconomic

scenario, which has allowed for the expansion of their social protection systems, which is not the same as in developing countries where the accelerated aging process is occurring in parallel with the economic environment which makes it difficult to expand the social protection system for all age groups and in particular for the older people (UNFPA and HelpAge International 2012).

Aging is already having a far-reaching impact on living conditions and the way societies and economies work. More broadly, the impact of the phenomenon of longevity on public policy and its implications for the economy makes sense of the term silver economy or longevity economy. The economic principle guiding this new vision is basic, since the profile of consumers is changing, the structure of production must be adapted to demand.

To address the challenges and seize the opportunities arising from population aging, the report "Aging in the 21st Century: A Celebration and A Challenge" by the United Nations Population Fund (UNFPA) and HelpAge International calls attention to the development of new approaches in the way societies are working their workforce and social and intergenerational relations to ensure that they can age safely and with dignity and that older people can continue to participate in their respective societies as full-time citizens (UNFPA and HelpAge International 2012).

Financial security is a major concern as you get older. It is a problem for older people and a growing challenge for families and societies. When the state cannot afford social protection expenditures, it will have to be the family taking care of its economically dependent elderly members (UN 2002). But in many cases, the family itself is not in a position to offer support without affecting its own economic situation. In addition, older people who have no family to support them become especially vulnerable (UNFPA and HelpAge International 2012).

Despite widespread protests in all countries where social protection systems are being restructured, many of which are designed in a favorable demographic situation, this appears to be an unavoidable situation as the proportion of the economically active population in relation to the elderly over 65 will continue to fall in the coming decades in all regions (UN 2009).

According to the United Nations (UN 2009), the worldwide potential support ratio for the next four decades will fall by more than 55% over 2009, reaching by 2050 to 3.9 working-age people for everyone over 65. This reduction will be greater in the less developed regions (49%), which if confirmed will substantially affect social protection systems.

Another challenge that should be addressed by policymakers is the ability of health systems to respond to the demands of this important part of the population. For WHO (WHO 2011), diseases and disabilities can be reinforced or mitigated by environmental characteristics to determine whether an older person can remain independent despite physical limitations. Still according to WHO, the longer people maintain their physical capacity and autonomy, the lower the costs for long-term care that impact families and society.

## Final Considerations

Achieving recognition of the needs of different generations within cities and exploring the city's potential for groups of all ages will be some of the central challenges in the process of making cities friendlier to older people.

Social protection systems need to adapt to a restructuring and lengthening life cycle to accommodate an active aging strategy, reflected in the right to age with dignity and security.

Decision-makers need to recognize that population aging requires a paradigm shift that associates the elderly with retirement, illness, and dependency to a new paradigm that perceives older people as active participants in an age-integrated society, active contributors, and beneficiaries of development.

# Civil Dialogue

Mariusz Wiktor Sienkiewicz
Department of Local Government and Policy, Maria Curie Sklodowska University, Lublin, Poland

## Synonyms

Civil society; Partnership; Public participation

## Definition

Civil dialogue is a form of contact between the state authorities and third sector organizations,

which consists of the mutual transfer of an opinion, information, or arrangement objectives, instruments, and strategies for the implementation of public policy.

## Introduction

Civil dialogue means various forms of participation of citizens in the communication with public authorities. In the narrower sense, called institutional, civil dialogue is understood as the participation of organized groups of citizens in the process of making decisions by public authorities (Schimanek 2007). Civil dialogue is considered a part of the decision-making process and a source of information for local politicians. As a result, before deciding, politicians have an access to social moods, beliefs, and preferences of citizens (Kuć-Czajkowska and Wasil 2014).

The essence of civil dialogue is the socialization of the process of public decision-making by the influence on lawmaking and preparation of documents concerning citizens. It is a kind of complementation of the institutions of representative democracy with participatory democracy. Civil dialogue can be identified with a platform on which public consultation is held on planning and decision-making on issues relevant to a particular social group. Representatives of social groups work alongside the political system and take positions on issues on which they are unable to express their opinion otherwise. Civil dialogue is a forum in the public space, on which interests of its participants are represented. It is essential that, in contrast to social dialogue, it does not put much emphasis on reaching agreements (Kacprzak 2014).

## Forms and Standards for Civil Dialogue

The relations between public authorities and civil society can be routed through multiple channels, on the initiative of each of the parties, by such means as "one-on-one" meetings, sessions, conferences, and written consultation procedure. Civil dialogue is a formal discussion on the issue in which two or more parties express opposing views and then look for an agreement that can satisfy all of them. Civil dialogue can thus be described as (AGE Platform Europe 2013):

- Mutual relations between public institutions and civil society organizations
- Various forms of civil society activities ranging from simple information dissemination, through consultation processes, to active involvement in decision-making
- Activities that take place at every stage of decision-making processes: establishing structures, defining political objectives, implementation, monitoring, evaluating, and ensuring the "continuation"

The degree of openness and the actual practices of civil dialogue in the European Union (EU) vary strongly within and between institutions. The "White Paper on Governance" (2001) developed for the first time a quite comprehensive approach to consultation and dialogue. The white paper marked a change of paradigm for the EU by clearly defining the EU policy process as the result of different influences and mechanisms of dialogue and participation, which are not limited to the three main institutions – parliament, council, and commission – and by acknowledging the need to foster citizens' involvement. The white paper was followed by several attempts to define the framework of dialogue. In 2002 the "General principles and minimum standards for consultation of interested parties" were published, representing the commission's voluntary "rules" on how to consult with stakeholders. The minimum standards are the following:

- Clear content of the consultation.
- Involvement of relevant parties must be ensured.
- Adequate information about and publication of the consultation.
- Minimum 8 weeks consultation period.
- Feedback must be given on the contributions received.

In the case of the European Union, the main premise for the development of the concept of civil dialogue is the search for a new model of democracy, so-called participatory democracy. This trend has been clearly visible since the mid-1990s in Western Europe, and it results in a large extent from the demise of civic activity and a decrease in the participation of citizens in public life. One of the causes of these negative phenomena is a crisis of parliamentary democracy which is not fully capable of effective regulation of economic and social life. The system of parliamentary democracy does not allow for full articulation of social interests resulting largely from inherent in this system "alienation" of elected representatives and priority of party interests over the interests of voters. Politicians elected in democratic elections are not able to formulate such governance programs and goals that would engage citizens in their implementation. One of very important functions of civil dialogue is to work out common goals of authorities and society. What very clearly appears in this context is the concept of common good, as a sphere of a common agreement between authorities and broader social partners, an agreement which is superior to their narrow interests. The existence of common good can justify the thesis that while in society there are divergent interests, and sometimes conflicting ones, there is always room for common understanding and agreement. Formal and practical development of the above trends can be best seen in the area of social dialogue, although it is still primarily a topic of discussion rather than systemic solutions and is characterized by the weakness of institutional solutions and their high instability.

Another premise for the development of civil dialogue was the resurgence in the 1990s of the twentieth century of the principle of subsidiarity of the state. What is also important are such prerequisites for civil dialogue development which are associated with the search not so much for a new vision of society and the state but for solutions enabling the repair of badly functioning democratic and social mechanisms. They concern mainly the reconstruction of public administration and opening it to cooperation with social organizations and businesses, as well as participation of these entities in decisions taken by the administration and control of services provided by it. They are expressed in the concept of good governance promoted by the European Commission.

In order to understand the mechanisms of modern civil dialogue, it is important to determine who its participants are. On the one hand, it is the state, and more precisely the government administration. The state has primarily a regulatory role. It constitutes law that defines the basic rules for the functioning of policies, the market, and society. This is the main sphere of dialogue with civil partners who are interested in participation in the creation of these rules and determination of mechanisms that enable their observance. Another area of dialogue is connected with the redistributive function of the state. Citizens want to have an impact on how public funds are divided through the state budget, who receives them and how much. The state also acts as a regulator of the sphere of both civil and social dialogue. On the basis of standards laid down by law, it sets out the objectives, principles, the subjective and objective scope, and forms and mechanisms of social dialogue. Citizens are the other party of this dialogue. In theory, any citizen who wants to participate in dialogue with the state should have such an opportunity, but in the indirect system of democracy and the current state of society, this is not possible. Representation comes to assistance. Every citizen has the right to speak with authority, but through their representatives. These representatives are voluntarily created civic organizations that fall between the public sector and the economic sector (i.e., in the so-called third sector). They are a platform, parallel to the political system, for the articulation of social interests that cannot be articulated in a different way because of the failure of the existing political systems (Schimanek 2007).

Civil dialogue can be used as a basic tool that can and should contribute to the realization of objectives of both the public administration and other sectors, the participants of which are aware that they form a (socioeconomic) community. Civil dialogue refers to the entirety of public

policies (carried out by the authorities of all levels); its essence is the socialization of public decision-making processes by adding also social and business entities to the group of decision-makers (Macełko and Mendel 2014).

The concept of civil dialogue presupposes a strong position of the government as a host of dialogue, its initiator and regulator. Dialogue in this model, called a neo-corporation model, is primarily the possibility for different social and professional groups to articulate their interests, so that authorities can make better decisions which are consistent with the expectations and possibilities of public. From the point of view of the government, civil dialogue understood in this way is conductive to:

- Socialization of decision-making mechanisms in order to take into account diverse points of view of the social partners
- Balancing the public interests in order to guarantee the universality of public good
- Better quality of solutions in the field of economic and social policy
- Preparation of the social partners and society for the effective implementation of programs of public policy
- Increasing the control over public authorities (Schimanek 2007)

From the point of view of citizens, civil dialogue is primarily:

- A possibility to access current information about the plans and doings of the government
- An opportunity to get acquainted with the opinions and positions of other social groups and environments
- A form of a current influence of citizens on decisions taken by the government
- An opportunity to participate in public life, especially for those groups of citizens that are not represented in the bodies of state power
- An opportunity for the presentation and the clash of interests of various social groups
- A chance to develop common goals for the whole society, accepted also by the government (Schimanek 2007)

In civil dialogue we can be differentiate several levels of citizen involvement:

- Informing citizens about plans of the public administration and decisions taken by it: it is a basic level, without which other forms of dialogue cannot function well.
- Consultations during which one or several different options are presented to citizens and their representatives, and their opinions are taken into account when making the final decision.
- Codetermination – authorities cooperate with the public and organizations representing them in identifying their needs, and the final decision is taken jointly with the social partners, usually through negotiations.
- Co-realization, involving the identification of common needs and then joint implementation of the agreed program, in the form of a partnership.
- Delegation of tasks and support for independent social initiatives – the government withdraws from analyzing social needs and defining solutions and instead supports civil society organizations, e.g., through a system of grants (Schimanek 2007).

## Examples of Projects Related to Civil Dialogue

### Poland: "A Dialogue Platform 'Cracow is Talking'"

In 2008 the Cracow City Council created the country's first section for social communication. The local authorities announced that they wanted the largest part of the population to participate in public consultations. To disseminate information about public consultations, a special website (www.dialogspoleczny.krakow.pl) was created, informing about urban projects, implemented investment, debates, and consultations in the city. On the dialogue platform, citizens can find information on how they can influence what is happening in the city (among others, by participation in meetings, public debates, social studies, surveys and polls, reporting topics for public

consultation and taking part in them, meetings with district councilors, the use of an online inquiry form).

### Sweden: "Citizens' Panel in the Municipality of Gnosjö"

In Sweden, an institution established to promote dialogue, develop methods, as well as prepare publications and training in this field is the Association of Swedish Municipalities and Provinces (Sveriges Kommuner och Landsting, SKL), associating all administrative units of the country (www.skl.se). The municipality of Gnosjö, which is a member of the SKL, offered its residents a so-called citizens' panel. The municipality used a variety of methods to inform the public about it (press announcements, briefings, entries on Facebook). Studies of the municipality show that people are most interested in the questions formulated by politicians, in which the impact of the panel on taken decisions is visible. Thanks to the panel and the citizens' awareness that they have a real influence on what is going on in the community, many investments and unpopular reforms were carried out. Authorities obtained, among others, residents' consent to raise local tax rates. This was possible because the municipality reliably informed its residents about the objectives for which funds from the tax would be allocated and how it would affect further development of the municipality.

### Sweden: Civic Councils in the Municipality of Hudiksvall

In 2006, the Swedish municipality of Hudiksvall realized a project of civic council creation. At the beginning there was a series of consultations with residents of nine cities in the municipality. The aim was to construct such councils that would best match the expectations of the residents. Then two politicians joined each council (one from the ruling majority and the other from the opposition). The task of the representatives of the authorities was to listen to the citizens and ask them questions and inform them through which channels they could handle matters discussed at meetings of the councils. It is worth mentioning the issues of road safety and the development of the port as example of question which the councils dealt with. Thanks to the voices of citizens, debates in the regional councils were more animated and conducted with commitment. Politicians, however, recognized the need for education in methods of civil dialogue and the development of local democracy. Although the time frame of the project is over, the municipality of Hudiksvall has decided to continue its cooperation with civic councils. Council members improve their "workshop," and representatives of the social side gain experience in managing the municipality, the principles of self-government, or ways of conducting dialogue. Thematic trainings subsidized by the municipality are organized, so that council members gain necessary competencies to perform their professional functions. Local politicians who sit on the councils also gain certain benefits from this. A research and development center has been established in the municipality of Hudiksvall, thanks to which it has become a center for high fiber-optic technology, thereby obtaining a high income. The residents' standard of living has risen significantly.

### Germany: Civil Dialogue for the Sake of Social Inclusion of the Elderly

Both at the regional and local level in Germany there is a strong connection between the representative initiatives at all levels of government in order to ensure an effective mechanism for citizen participation in policy development. German local civic dialogue involving the elderly is conducted on the basis of the memorandum for the involvement of elderly people in politics and decision-making processes at the local level, which was issued at the federal level in 2008 in order to create a positive image of active aging. It also puts emphasis on promoting greater participation of older people in political decision-making. In 2008–2010, more than 150 local governments received pilot funding in the amount of EUR 10,000 each. The aim was to examine opinions and demands of older people articulated bottom-up in debates on the basis of local forums. Through this initiative, concrete proposals for local community projects were formulated which we then launched, thanks to the experience of

older people. Moreover, a special law regulating the issues of participation of seniors – "Seniorenmitwirkungsgesetz" – was also adopted at the national level, and legal acts supporting regional councils of senior citizens were separately prepared. For example, the council in Mecklenburg-Vorpommern (LSB MV) supports broader participation of older people in politics in all districts (Landkreis) and cities of this rapidly aging land. On the initiative of the LSB MV, the Fourth Senior Citizens Parliament adopted in 2010 a proposal concerning "measures to prevent poverty in old age and secure pension payments." The participation of older people at the local level is organized by the Local Council of Seniors in the number of about 1200. The councils work during the first stage of political decision-making, and then legislative initiatives go to the land parliaments (the European Commission 2010). It is an essential fact here that Germany is an aging country, and engaging the elderly in civil dialogue gives them a successful and measurable impact on their matters and interests, defined in policies of the local and national level.

### France: A Participatory Budget in the Town of Grigny

The participatory budget is an expression of enacting the idea of participatory democracy by the French town of Grigny. As a result, the inhabitants, as the first in France, have had a possibility to directly influence projects implemented in the town. Since 2004, they have been involved in the planning of the budget of the town. Everybody can submit proposals to the budget; all of them are analyzed and voted on by citizens. As a result, a draft participatory budget is prepared, which is ultimately approved by the town council. Thanks to the participation in the budget construction, residents of the town have an opportunity to gain valuable information – they learn about the work of councilors, explore the rules of investment financing, and gain knowledge about the functioning of the town. Moreover, they master a difficult art of choice, because it is obvious that due to limited resources, it is impossible to implement all projects. What is equally important is the positive social dimension, as the joint preparation of the budget by the authorities and the inhabitants strengthens social and personal ties, as well as builds a responsible community of the town. In this process councilors take on a role of animators and educators. The completed projects have, in turn, a high degree of acceptance and are much less likely to be poorly executed or vandalized. In Grigny the civic budget is a next step in building participatory democracy. Previously, civil dialogue has been held in districts. Many people who have worked previously in district councils and have been accustomed to the idea of participatory democracy have obtained mandates of town councilors, thus ensuring the continuity of the process and leading to a situation in which members of the authorities and civil representatives mingle over time. Due to these closer personal relationships, civil dialogue in Grigny is not a debate among "one's own people" and "strangers," but a meeting of people who know each other and share the common goal of the development of the town (www.dobrepraktyki.decydujmyrazem.pl; Kacprzak 2014).

## Conclusion

Activities and examples related to civil dialogue constitute an important form of management of the public sphere. However, civil dialogue still does not have a stable and legally established position as it is dominated by temporary measures, allowing for the impact of citizens only in certain areas of public administration and to a limited extent. The results of the described forms of dialogue (including a participatory budget) are often not binding for the authorities. It also happens that local authorities simply have bad intentions and are not interested in their citizens' real impact on their policies. The culture of civil dialogue is different in each country. As a rule, it is determined by historical circumstances, attitudes of citizens, and national and local authorities. Western European countries can boast of much more experience in the field of civil dialogue than the countries that have a legacy of the socialist system, such as Poland, and other countries of the so-called Eastern Bloc. If the situation is to

improve, authorities at all levels must consciously cede some of their powers to citizens, who in turn should shift their activities from the orientation on individual interest toward common good. The civic participation system would work more effectively if a formal framework and principles of dialogue were created. The lack of such universal principles results in difficulties in communication and translation of the findings of dialogue into practical actions. If civil dialogue is to be effective, local authorities must obligatorily take into account in their policies the results of the negotiations and arrangements with nongovernmental organizations and representatives of citizens. Otherwise, there is no motivation for the public to participate in dialogue. In the construction of civil dialogue, it is possible to draw on patterns of other countries, but previously an appropriate path to high-quality civil society must be built. In this case, the use of ready-made patterns is difficult because of specific historical and cultural conditions (Kacprzak 2014).

# Civil Rights

Richard Greggory Johnson III
University of San Francisco, San Francisco, CA, USA

## Synonyms

Civil rights: social justice; Equality; Equal opportunity; Human rights; Parity; Social movements

## Introduction

The United States is a country whereby civil rights has not come easy to disenfranchised groups such as people of color, women, the LGBT community, and the working poor, though the United States has had groups in support of ensuring that all Americans have a voice which would be heard in the halls of Congress and beyond. The paper on civil right will begin with a definition of civil rights, how the field of Public Administration fits in, and why charter schools may not be the best solution to providing students with an equitable public education.

## Civil Rights Defined

Civil rights as a movement began during the late 1950s and 1960s impart because African Americans were routinely denied access to housing and jobs. It is also interesting to note that this was about the time that the term social equity was beginning to emerge in the field of Public

Administration. Known as the father of social equity, George Frederickson coined the term during the 1960s and since that time he has helped Public Administration to create an increasing awareness and understanding of fair and ethical treatment (Frederickson 2005). However, when Frederickson coined the term he was referring to the fair practice of garbage collection and other city services regardless of which neighborhood or location. However, social equity is now used by a new group of public administration scholars (see work of Blue Wooldridge, Susan Gooden, Mario Rivera, Al Borrego, Mitchell Rice, Richard Greggory Johnson III, Kris Norman-Majors, Lorenda Naylor, and Wally Swan) who have included social equity to mean civil rights for everyone, especially people from disenfranchised communities. Indeed, the term Social Equity Scholar is ably applied by the above public administration scholars and others who make the work of civil justice as part of the research, teaching, and/or practice.

The United States Congress has also created the National Academy of Public Administration (NAPA) with a Standing Panel on Social Equity in Governance in 1967. One of the hallmarks of this Social Equity panel is the annual Social Equity Leadership Conference which is now in its 15th year. The purpose of the conference is to advance new knowledge and practical ideas within public administration regarding social equity. For example, the conference was held at the University of San Francisco, June 1–3, 2016, with 200 registrants over the three-day period with more than 70 papers and poster sessions and panel presentations (https://www.usfca.edu/management/Social-Equity-Leadership-Conference-2016).

One of the most meaningful events of the conference was the Luncheon in which Lt. Governor Gavin Newsom addressed an audience of almost 300 people (the luncheon was opened to people who just wanted to attend this event). Newsom's address typified the true meaning of civil rights, social equity, and human rights. In 2004 Newsom ordered that the City of San Francisco Clerk would begin to issue marriage licenses to same-sex couples (CNN 2004). Reporting by CNN, Newsom made the following remarks:

> I think we're on firm legal footing and legal grounds, and certainly I believe very strongly and passionately we're on the right moral ground.

Newsom's commitment to civil rights is indicative of the power that one person can have when achieving and fighting for the common good.

## Civil Rights and Public Education

As stated above, civil rights have never come easy in the United States. For the most part, the Supreme Court has had to adjudicate on some of the most pressing matters in the country during the twentieth and twenty-first century regarding racial matters. Perhaps one of the most notable cases of the twentieth century regarding race and education was Brown *v. Board of Education* (1954). The United States had been operating its public K to 12 schools under the separate but equal decision, *Plessy v. Ferguson* (*1896*). In 1954 the Supreme Court ruled that separate but equal was unconstitutional in a vote of Young et al. (2015). *The benefit of Brown v. Education* as a civil right is that by law public education was desegregated. This law according to Young et al. (2015) reached its peak in the mid-1970s when more than 70% African Americans attended desegregated public schools.

However, the authors argue that the trend has been reversed due to White Fight. Alana Semuels (2015) argues that White Flight has been occurring since the 1960s when White families moved from the urban center to the suburbs after noticing an influx of African-American families moving next door to White families. Public schools in the urban centers have not benefited from White Flight due to a lack of resources that public schools depend upon. It is unfortunate that public schools have had to result to using a system referred to as zone (district) public schooling. The real downside of school zoning is the segregation in the continuation of race and social class that continues. Zone schooling is a prevalent system that cities such as New York have employed for the last several decades. d, The system involves children attending their zone or area public schools. The following information is

clearly listed on the New York City Public School website:t

> What is my local public school, and how do I enroll my child?
>
> For elementary or middle school: Register at your child's zoned school. Your zoned school is determined by your home address. If you don't know your zoned school, call 311 or visit the Department of Education website. If you don't have a zoned school, please visit a Student Registration Center in your borough of residence. For high school: Register at a Student Registration Center in your borough of residence http://www.nyc.gov/portal/site/nycgov/menuitem.a7711323366a72aee846f0b001c789a0/)

This system continues to leave poor students and communities of color in situations where they are relegated to attend the schools in their neighborhood often with little resources and even less hope for success. New York City has at least began to address the issue of under performing public school by closing 29 high schools in 2009 and creating 200 smaller high schools (Kemple 2015). This reform according to a report authored by Kemple (2015) suggests that the New York City Department of Education reform was predicated on the below interlocking pillars:

- Eliminating the worst schools in the system by closing failing, "factory-style" high schools. During the time period of this study (2002–2008), the DOE initiated the closure of 29 low-performing high schools.
- Increasing the supply of better options by creating new, small high schools. These closures were accompanied by the creation of more than 200 new high schools, which were often located in the buildings that had housed the closed schools.
- Enabling families to select their high school through a universal high school choice process. In 2004, the DOE introduced the High School Application Processing system in which nearly 80,000 eighth graders ranked their choice of high school by interest.

Adlai E. Stevenson High School was a large dropout factory located in the Bronx, NY, and is an example of a failing public high school. Stevenson High School operated in the Bronx, NY, from the 1970s until 2009. In 2009, The Department of New York closed Stevenson High School citing problems with violence, poor test scores, and truancy (http://schools.nyc.gov/SchoolSearch/).

Norman Thomas High School is another example of a large dropout factory and was closed in 2014 (Inside Schools 2014). Though Norman Thomas considered a "specialized (school forcing on a certain subject or subjects, i.e., The High School of Performing Arts)" public high schools in NYC, the school still only graduated 55% of its students on time. Inside Schools reported the following about the Norman Thomas High School's closing:

> In 2010, only 55 percent of Norman Thomas students graduated on-time and though parents had some positive feedback about staff members and the school's extensive involvement with outside programs and organizations, many questioned why the school had been failing for so long and wanted other options were available for their children. In February 2011 the Panel for Education Policy approved the Department of Education's proposal to phase out and replace the school due to persistently low performance and an inability to be transformed (Inside Schools 2014).

### *Waiting for Superman* Documentary Critics

The issue of failing urban schools has caught the public's attention in the documentary *Waiting for Superman* (2010) which depicts many urban public schools were considered dropout factories due to low-performing students, uninspiring teachers, unions, and a lack of school resources. The film concludes by suggesting no real methods for fixing failing public schools in many of the urban centers across the United States such as Los Angeles, New York City, and Chicago. However, the film does point out that charter schools as being a key way in fixing the public school problem. The issue with the film according to Parado and Montez de Oca (2014) is one of pedagogy in which the directors of the film play to an empathic audience of people who already buy into the broken public school narrative. Therefore, as such the film only seeks to reinforce the stereotypes of public schools as a system that has historically been broken for

years and cannot be fixed. According to the authors, the film gives the impression that the racialization of education is not an issue either.

## The Issue of Charter Schools as a Civil Rights Movement

The national public charter school movement was started in early 1990s in Minnesota in order to provide greater autonomy to schools, greater freedom to teachers, and more choice to parents (Crutchfield 2015). According to Jandel Crutchfield (2015), the charter school movement is the fastest growing education reform in the country, with over 1.5 million students across 39 states. According to Crutchfield, there are generally three types of charter schools, namely start-ups, voluntary conversions, and forces conversions. Start-up charter schools may start a school if the "like-minded" individuals and community leaders find there is a need for a topic that is not being offered in the existing neighborhood schools with interested educators and parents who agree to start this new endeavor. Voluntary charter schools may use their current building and retain some staff. Forced conversion charter schools are ones that have chronic low performance problems such as Adlai E. Stevenson High School and Norman Thomas High School mentioned above where each have around three charter schools occupying the former high schools.

Stein (2015) in his examination of charter schools in Indianapolis found that there is evidence of racial sorting when parents are given school choice. This according to Stein leads to less diversity when he compared the racial demographics between public sector schools and charter schools.

Despite the segregation, low-performing schools and lotteries for charter school depicted in *Waiting for Superman*, the criticism of this film has been harsh (Goldstein 2010). From the American Federation of Teachers Union (AFT) to public school districts around the country decried that the film was over simplified and did not give an actual portrayal of America's public schools including their victories and challenges. The film also creates the sense that charter schools are the way to go with trying to educate children in the twenty-first century. Indeed, it is argued by many that charter schools appear to be more effective than publicly run schools because they serve fewer children with disabilities and fewer children from immigrant backgrounds (Chapman 2013). Therefore, education becomes not as a matter of civil rights but privilege for the few students that are selected through lottery for a charter school. This is not how public education should work as George Frederickson would suggest that effective public education should not be a question of where someone lives and if they are lucky enough to draw a number for a charter school.

The charter school movement is one of the fastest growing school reforms going on in the United States (Greenblatt 2014; Frankenberg 2011). The effort is being carried forth by community leaders, teachers, and parents wanting choice for schooling. However, to suggest that charter schools are a matter of civil rights may be a far reaching account.

The use of the term civil rights appears to be the language of choice for people trying to advance the charter school debate. In 2014, Bill De Blasio, Mayor of NYC framed his remarks at a procharter gathering as a matter of civil rights (Shapiro 2014). The mayor also quoted Frederick Douglas in his address which did not go over well with the civil rights activists in the audience according to Shapiro (2014).

Quoting Frederick Douglass at a recent appearance in a black church in Bedford-Stuyvesant, the mayor said, "Didn't the great man once tell us, 'Power yields nothing without demand?' So we, in this time, have demanded something different for our children and we won't accept an education system that doesn't support them (Shapiro 2014)."

Brian Jones (2011) suggests that it is not appropriate to use the terms civil rights and charter schools in the same sentence. In fact, the two movements are in conflict with one another according to Jones who argues the following comments in The Huffington Post.

First, and perhaps most importantly, it is a "movement" that claims that the interests of adults (specifically, teachers) are in conflict with the

interests of children (students). Whereas the civil rights movement was explicitly social democratic, challenging the government to take action on racism and poverty, and supporting trade unions as a means of achieving more social equality, the current education "reformers" are convinced that inequality can only be undone by *weakening* the teachers' unions.

Secondly, this "reform" effort is a "movement" that takes power away from ordinary people, while claiming to do the opposite. In the name of "parent power," charter schools have reduced actual parent power. Charter school parents do not have a right to have any say in the governance of their child's school and do not even have a right to place their child in it. The child must win a lottery, and then the parent and child must, in many cases, adhere to a strict contract to remain in the school. Charter boosters will respond that parent demand for their schools is through the roof, but that has more to do with the way parents are perpetually bombarded with slick advertising materials from Madison Avenue than it does with the actual merits of the schools. When was the last time *Mad Men* created promotional materials for a genuine grassroots movement?

Thirdly, while it has black faces perched in important places, the charter school "movement" is not a "black movement" for education. Whereas folks participated in the civil rights movement at great personal risk, many of the influential black supporters of charter schools stand to profit handsomely (Jones 2011).

The three points made above by Jones clearly demonstrate that the charter reform movement is not about civil rights for Black and Latino students but more so about control for the power makers and parents that want out of the public school system due to perceived notions of inadequacies.

Frankenberg et al. (2010) also make the argument that charter schools have been successful politically but also a civil rights failure. For example, the authors found that the Southwest have five of the eight states where Latinos have historically been concentrated. In 1973 the Supreme Court found that Latinos were discriminated against a rate that was paralleled to that of the African Americans in the South. The authors went on to suggest that the discrimination was often based on race, language, and poverty, thus providing students a chance for educational choice. This fact caused an acute realization that Latinos were substantially underrepresented in charter schools within the Southwest region of the states.

Additionally, Frankenberg et al. (2010) discovered in their research that in more than 40 states, charter schools were more racially segregated than public schools. Though there were exceptions admit the authors. However, these exceptions are very few when data were analyzed around the United States.

Mentioned briefly above charter schools are also not chiefly about civil rights due to the notion of admitting students based on a lottery system. This system is when charters schools only have a few spaces left and must open these spaces up on a lottery system. This entry will not discuss the different forms that these entries take as much of it depends on rules of the district and the state that the charter schools reside. However, Chabrier et al. (2016) postulate charter school lotteries have major issues especially regarding what happens to the students who lose. The research according to Chabrier et al. (2016) go on to suggest that charter schools that are the high performing high school, typically in the suburbs generally less effective charter schools' vs charter schools in the more depressed, segregated districts and under performing schools have effective charter schools. In other words, the issue with the lottery charter system is that the students who lose are the ones in need of a better education.

Perhaps the most damning report was leveled by the *Center for Popular Democracy* in May 2016. The center suggests that the Federal government has poured 30 million dollars to support charter schools around the country. However, the center has found in their research that charter schools suffer from mismanagement and abuse to the tune of $213 million dollars since 2015. News of this information has only come to light due to whistleblowers, investigators, and reposts. A key reason for the abuse is due to little oversight of charter schools. The center suggests the

following three recommendations to help slow or eliminate the problems addressed in this section.

The Center for Popular Democracy has recommended the below three strategies to assist charter schools countrywide:

- Mandate audits that are specifically designed to detect and prevent fraud and increase the transparency and accountability of charter school operators and managers.
- Design clear planning-based public investments to ensure that any expansions of charter school investments ensure equity, transparency, and accountability.
- Increase transparency and accountability to ensure that charter schools provide the information necessary for state agencies to detect and prevent fraud.

## Conclusion

This entry has framed the concept of civil rights by first linking the term to social equity used in the field of public administration. The entry has also addressed the importance of the Social Equity Leadership Conference held annually in June and then turns its attention to civil rights, public education in the United States, and the charter school reform. It is safe to suggest that the charter school reform is gaining momentum as there were students should be in between million and enrolled across the country where charter schools reside (Allen and Consoletti 2010).

This entry concludes by suggesting that public education, segregation-free and effective, and challenges are the hallmark of a democratic society. Therefore, the urban public educational system around the United States is in need of constant reform. This entry has demonstrated this above. However, this entry is not confident that charter schools are even addressing public education as public good and should be afforded to everyone. Though much smaller than the field of education, public administration must too be concerned with the improvements greatly needed by the public school system. This is especially important that charter schools are not standardized in term of their curriculum. This issue has also made assessing the effectiveness of charter schools over all.

## Civil Rights in Other Countries

Sharron Y. Herron-Williams and
Alecia D. Hoffman
Alabama State University, Montgomery, AL, USA

### Synonyms/Acronyms

AFSPA (Armed Forces Special Power Act); DRC (Democratic Republic of the Congo); LGBTI (lesbian, gay, bisexual, transgender, intersex); MPLA (Popular Movement of the Liberation of Angola); NA (National Assembly); NGO (nongovernmental organization); UNCR (United Nations Commission on Human Rights)

### Definition

Civil rights: The right of citizens to political and social freedom and equality
Conflict theory: When tensions and conflicts arise because resources, status, and power are unevenly distributed between groups in society and these conflicts become the engine for social change

### Introduction

> "Each time a man stands up for an ideal, or acts to improve the lot of others, or strikes out against injustice, he sends forth a tiny ripple of hope." Robert F. Kennedy

According to the Universal Declaration on Human Rights (1948) Article 2: everyone is entitled to all the rights and freedom set forth in this declaration without distinction of any kind, such as race, color, sex, language, religion, political or other opinion, national or social origin, property, birth, or other status. Furthermore, no distinction shall be made of the political, jurisdictional, or international status of the country or territory to which a person belongs, whether it be independent, trust, non-self-governing (Please see United Nations.org www.un.org/en/decolonization/nonselfgovterritories.shmtl), or under any other limitation of sovereignty (For more information about the Universal Declaration on Human Rights, please access www.un.org.en/universal-declaration-human-rights).

In the preamble to the International Covenant on Civil and Political Rights (1966, 1976), in accordance with the Universal Declaration of Human Rights, the ideal of free human beings enjoying civil and political freedom and freedom from fear and want can only be achieved if conditions are created whereby everyone may enjoy his civil and political rights, as well as his economic, social and cultural rights… (For more information about the International Covenant on Civil and Political Rights, please access http://www.ohchr.org/en/professionalinterst/pages/ccpr/aspx).

It is critical to start this discussion about civil rights in other countries with these two statements, because although the idea that mankind has certain inalienable rights, which have been in existence for centuries, the process of garnering civil rights for all has been daunting. When talking about civil rights, one cannot do so without discussing disenfranchisement of some sort. In most countries, because of the mobility of populations, a shift in economic resources, and changes in political regimes, the discussion about civil rights has become more prevalent. As people move and regimes change, the need for control has grown. Discussions about civil rights no longer just include conversations and legislation about access, but the rights of people as human beings or human rights.

The Civil Rights Movement in the United States started because of the oppression of certain classes or groups within the population. With the advent of slavery, African Americans were

considered property, and with the rise of social classes and the structuring of government, women too were considered property. As a result of lack of access, disenfranchisement was created and eventually led to revolts by the people. Looking at historical and modern actions taking place around the world related to civil rights, one is forced to reexamine the role of conflict theory as originally surmised by Karl Marx and Friedrich Engels and how this theory provides the proper lens to view the direction of civil rights not just in the United States and North America but how it is perceived and practiced on other continents.

## Theoretical Framework and Literature

Conflict theory, which is a derivative of Marxism, states that tensions and conflicts arise when resources, status, and power are unevenly distributed between groups in society, and these conflicts become the engine for social change (Crossman 2016). Power is retained by those who control wealth accumulation, political access, and other material resources. When examining conflict theory, one not only is concerned with socioeconomic differences between persons but also other factors such as race, sexuality, gender, and religion.

Prior to the recognition of Karl Marx's theory on conflict, similar arguments were made by Thomas Hobbes in his manuscript *Leviathan*. Hobbes' overall premise was that in the most basic society, there will always be discord and conflict, and through the establishment of a social contract, then are men able to live in some semblance of harmony. This protection, afforded by the governing structure, has the responsibility of ensuring that the rights of men are protected from others who would seek to trample upon them and protect the commonwealth of the nation. This philosophical idea as proffered by Hobbes warrants some discussion, because it is pertinent to this discussion on civil rights. Since Hobbes sees man as selfish and concerned about his own well-being possibly to the detriment of others, a governing structure that mirrors mankind is necessary for the peaceful cohabitation of man (Hobbes 1651 in Ebenstein and Ebenstein 1999). The Hobbesian approach to the study of civil rights in other countries is recognized by Günther Schlee (2004) who quotes the work of Max Gluckman who "sees humanity as constantly caught up in conflicts and argues that such ties make possible a certain measure of peace in society." This aforementioned statement highlights the need for crosscutting social ties in society, and this thus lessens social conflict.

Many scholars have examined the difficult relationships that exist between people in society as well as people and the governments which are supposed to protect the rights of the members of society.

> The argument of group conflict theory is that competition between racial groups – competition for political, social, and economic resources – makes a unique contribution to political hostility between members of those groups. That is, the placement of an individual within a group and the circumstances of that group in society and vis-à vis other groups in society will affect how that individual approaches decisions about the allocation of political, social, and economic cost and benefits. (Glasser 2003)

Glaser further concedes that nonracial groups can also stimulate group conflict due to the slightest differences among individuals, which can exacerbate conflict over scarce resources. Whites believed that Blacks posed an existential threat to Whites in American society, particularly as it relates to political issues and resources. The same can be said in homogeneous societies where the members possess other characteristics that would bring about discord, i.e., religion, sexuality, or gender if conflict theory is applied.

Another supposition provided by Michael T. Klare suggests that conflict can be attributed to natural resources. Natural resources, just as any other resource, can become scarce, and conflicts can emerge over the rights to such precious commodities. Klare further surmises that these resource wars are likely occurring in countries that are considered poor and having weak governments that align with multinational corporations to market the precious resources. However, societies are now beginning to recognize that humans are the most valuable commodity and the development of this commodity takes time. To the detriment of the development of humans and social order in said societies, many leaders' short-term calculations dominate (Klare 2001).

The thesis delivered by Klare is a timely analysis of the implications of resources on the treatment of human beings. These not only have to be natural resources such as gold, oil, and diamonds but also resources and commodities such as jobs, housing, and food. This approach to the examination of conflict theory also demonstrates a symbiotic relationship between the public choice model in economics, public administration, and political science. Through the application of game theory-based models such as public choice, it is evident that conflict emerges due to the shift of normatively believing that government has the responsibility of working on behalf of the collective good of the people to that of working on behalf bureaucrats, politicians, and even the people operating in a self-interested manner. The relationship that conflict theory has to public choice econometrics and therefore civil rights is evident in the way in which decisions are made about who gets what, when, and how.

There are additional scholars, such as Lachmann, Bartos and Wehr, and Raimo, who have discussed the role of conflict theory and how it relates to a particular nation-state or region. Individuals such as Sanja Kutnjack Ivokoic and John Hagan, who examine the applicability of conflict theory to the crisis in Sarajevo; Andrew Williams in his study of Moldova; and lastly Herman Strasser, who examines class formation, all focus on the role of civil rights in the their respective areas of study through the analysis and applicability of conflict theory (Ivakovic and Hagan 2006; Lachman 1990; Bartos and Wehr 2002; Raimo 1991; Williams 1999; Strasser 1980).

## The Role of Government in Securing Civil Rights

One of the major responsibilities of government is the protection of those who live within the governing jurisdiction that is considered to be its' sovereign territory. This preeminent institution has the responsibility of not only protecting those within its borders from external and/or internal threats and maintaining order, but it must also protect the rights and facilitate the well-being of citizens who live within its' jurisdiction. From a purely democratic standpoint, the role of the social contract is extremely important and must be adhered to in order for a vibrant, productive society to thrive and compete within the international political, social, and economic order. Furthermore, it is of paramount importance that the sovereign rule of the people be protected. In most developed societies, the government has the responsibility to act on behalf of its citizens through the social contract which is usually given to the citizens by way of a recognized constitution. Additionally, other legal mandates as set forth by a parliamentary body, legislative assembly, or some other form of governing body hold the same legal force as do those principles that have been set forth within the original social contract that has been agreed upon and accepted by those who live within the governing jurisdiction.

Coupled with the legal principles that are adopted by a nation-state, other international organizations and regional bodies may also implement rules and resolutions which are expected to be adhered to by participating member nation-states. To elucidate this principle, the articles set forth by the United Nations as it pertains to civil rights have been agreed upon by those member states which have signed on to the Universal Declaration of Human Rights and the International Covenant on Civil and Political Rights. However, and possibly more importantly, by the mere fact of becoming a signatory member to the 193-nation-state multilateral institution, those member states have agreed to adhere to and uphold these universal rights of man which are rights that are inherent in all men at any given time and in any given place. Although this principle, however noble and beneficial it may be to maintaining the international order and peace in the world, the true applicability of legal mandates and social contracts at the nation-state level may be lacking in some areas of the globe. The rules set forth by the United Nations and ideas espoused by political philosophers who predate the idea of the institution are at times ignored or misconstrued by some nations that believe civil rights do not apply to every given group that resides or even crosses into their borders, even if temporarily. Examples of the

inconsistencies in the application of civil rights being afforded to an entire population can be demonstrated through an examination of a country in the following regions: Africa, Southeast Asia, and South America and Europe.

## Africa

The question surrounding civil rights in Africa is not a new discussion. In early writings about the Arab conquests during the seventh century, it is evident that basic civil and human rights were not being afforded to those swept into the East Asian slave trade. During the period of European imperialism and the quest for new resources, human and natural resources led to the colonization of the continent at the Berlin Conference in 1884–1885. Finally, the independence movements, which led to the dawn of a "new Africa," commencing during the 1950s and finally culminating in the mid-1990s, highlighted the civil rights issues that plagued many of the newly independent nations. During each of the aforementioned periods, there have been many questions regarding the practice of civil rights in Africa and how the varied governmental institutions have or have not operated to ensure that basic fundamental rights were afforded to every human being.

Each of the aforementioned periods can aptly demonstrate the utilization of conflict theory to show the role of the government or those in power operating in manner to ensure that resources are obtained to perpetuate the growth of certain populations within a nation. This often times occurs to the detriment of other groups in society, be they groups within a territory governed by the nation-state or outside territories by way of conquest. During each of these periods, the distribution of these resources, status, and power among the groups involved has precipitated some type of change in the societies involved.

In the twenty-first century, there are still some widespread issues as it pertains to the protections of civil rights for the people of Africa. There have also been some gains with the help of local governments and international organizations such as the United Nations.

### Angola

The US State Department indicates in their 2015 report that the country of Angola suffers from cruel, excessive, and degrading punishment; limited freedom of assembly, associations, speech, and the press; and unlawful deprivation of life and lack of due process, trafficking in persons, forced labor, and limits on worker's rights and instances of failure to compensate persons upon the use of eminent domain.

Although the government of Angola has taken some measures to resolve these aforementioned abuses, the system which should allow for checks and balances has been considered to be inadequate as of the 2015 US State Department report. Coupled with the weak system of checks and balances includes weak institutional capacity, a culture that allowed for exemption from punishment, and government corruption U.S. Department of State (2015a).

Several of the examples of human and civil rights abuses cited in Angola include the excessive use of deadly force on Light of the World Church members in Huambo Province and police abuse of protesters, such as the September 15, 2014, incident when Raùl Mandela was beaten by the police of Luanda Province (U.S. Department of State). (A report from AllAfrica.com by way of the Angolan news outlet *Maka Angola* cites the date of the incident of Raùl Mandela's confrontation with the Luanda police as November 22, 2014. For further details, see "Angola: How Police Commanders Brutally Assaulted Laurinda Gouveia" in *Maka Angola* December 2, 2014. Accessed June 29, 2016 available from allafrica.com/stories/201412021275.html.) In addition, there are stories of other individuals such as Baixa de Kassanje who was in the company of Laurinda Gouveia, both accosted and beaten by the police near Independence Square in Luanda Province on November 23, 2014 (De Morias 2014). This is one example of the arbitrary arrest of individuals and unlawful detainment in violation of the Law on Precautionary Measures in Criminal Proceedings [Law 25/2015] (U.S. Department of State 2015). There are other examples, one of which includes the detainment of three journalists that witnessed the

unlawful detainment of a group of activists. For those who have been detained by authorities, there are reports that payments of bribes to authorities are needed to release prisoners. The bribe system has also been utilized to prevent family members from gaining access to those who are in custody of the authorities of the state. The aforementioned incidents have a direct relationship to political dissent and political participation. There have been reports that opposition parties face harassment and intimidation from the Popular Movement of the Liberation of Angola (MPLA) supporters. Overall political participation is open to all nationals of the country, and women and minorities hold elected seats in the National Assembly (NA) with 79 members being women in the NA, 2 women governors out of 18 nationwide, and 8 women cabinet members out of 34 (U.S. Department of State 2015).

As it relates to freedom of speech and the press, reports of threats by authorities toward journalists and other members of the press that print critical stories about the president are common. Likewise, there have been complaints regarding a lack of transparency and communication, which lead to bias in reporting. Journalists were also harassed and intimidated by authorities and charged with libel to limit the ability to report certain actions of the government. To provide a relevant example of these types of abuses, in May 2015, Rafael Marques was found guilty of criminal libel when he failed to communicate his research findings to the Angolan Armed Forces or other companies that were allegedly involved in human/civil rights abuses for comment to counter the findings of his research (U.S. Department of State). Marques de Morais research centered on the abuses in the Luanda Province diamond mines which culminated in the publication of a full-length manuscript entitled *Blood Diamonds: Corruption and Torture in Angola*. The court gave de Morais a 6-month suspended sentence (Smith 2015). According to the US Department of State, the rationale for the courts suspended sentence was that "the Ministry of Justice and Human Rights stated that the majority of cases mentioned in the Marques 2011 accusation had already been tried and sentences imposed on the private citizens and members of the security forces found guilty of human rights violations before Marques published his accusations" (U.S. State Department 2015).

The right of freedom of assembly has also been regularly restricted by the government, with activists being threatened through intimidation and death threats. The government has also restricted the free association of persons that have been considered suspicious. This was typically done through the denial of permits for organized activities. Although the Angolan constitution allows for freedom of movement, emigration, and repatriation, there have been times when these rights are restricted. The government has cooperated with the United Nations Commission on Human Rights (UNCHR); however, there are sources which claim that authorities have abused the international civil and human rights of migrants which shared the border with the Democratic Republic of the Congo (DRC). Some of the measures that have been taken by authorities include roadside checkpoints with bribery and extortion being used as a means by authorities to limit movement and harassment and expulsion of irregular migrants from West Africa and some Asian countries. To combat some of these aforementioned issues, the Asylum Law (Law 10/2015) was implemented with centers being constructed in Luanda, Luanda Norte, and Zaire provinces. The major goal and focus of these centers is to act as reception places for refugees until the government makes a decision about their case (U.S. Department of State 2015).

Reports of refugee abuse are also prevalent in the Lunde Norte Province where degrading treatment and reports of rape and sexual abuse have been carried out against Congolese migrants. To counter these reports from NGOs, the president worked with the United Nations to create a commission that would work to improve border issues. Refugees have also faced difficulty in obtaining access to basic services such as health care and education due to lack of appropriate documentation coupled with corruption by authorities.

Coupled with the discussion of refugee abuse, there is a need to discuss the rights of workers in

Angola since many of the refugees within the country face discriminatory and civil rights abuses by the nature of the work that they perform. The 2015 Country Report on Human Rights has noted that there are instances of forced labor, particularly in Luanda Norte and Lunda Sul provinces (U.S. State Department 2015). Additionally, the 2015 *Trafficking in Persons Report* indicates that forced labor and trafficking in men, women, and children for the purposes of labor and sex have been reported in the country. The US State Department has placed Angola as a Tier 2 country which means that it remains on a watch list until the Angolan government takes the appropriate measures to eliminate forms of twenty-first-century slavery. Some recommendations for Angola to improve the status of refugees and its status in human trafficking include:

> Use provisions in the 2014 money laundering law to investigate and prosecute money forced labor and sex trafficking offenses; train law enforcement officials on these provisions; systematically investigate labour trafficking in the Angolan construction sector; develop systematic procedures for identifying trafficking victims and train officials on such procedures; develop uniform and systematic referral procedures for all provinces; undertake efforts to provide shelter, counseling, and medical care to both child and adult victims, either directly or in partnership with NGOs; collect and analyze anti-trafficking law enforcement data; and continue to organize nationwide anti-trafficking public awareness campaigns (U.S. State Department Human Trafficking Report 2015).

In addition to the rights of those who are performing forced labor, there are also instances where the rights of some employees in the traditional work sector are compromised. To explicate this point, freedom of association and collective bargaining were not respected, and there is a need for government approval to join unions in Angola. Those working as civil servants do not have a right to collective bargaining. This close relationship between the government and unions correlates to the historical ties between political parties and labor movements. This is a characteristic that is common in many African countries.

An "other" group that has faced civil rights abuses in Angola is the San indigenous people. The San people number roughly about 8,000 and have had very little participation in political life in the country. NGO advocates have been working on behalf of this group to increase the amount of services and coordinate and improve communication with this community. This group has particularly suffered from eminent domain. After the end of the Angolan civil war, the land which originally belonged to the San was confiscated by elites and businessmen. Although attempts were made to provide some nominal reappropriation of the land for farming and cultivating purposes, the indigenous people lacked the more sophisticated equipment to perform the measures of cultivation. With these types of setbacks, land has been reconfiscated, and this has placed the San in a position which compounds their poverty and lack of voice (U.S. State Department 2015; IRIN 2004; IWGIA 2014).

In conclusion, the utilization of conflict theory in Angola is timely and relevant to the examination of civil rights in the country. As stated, conflict theory espouses that tensions and conflicts arise when resources, status, and power are unevenly distributed between groups in society, and these conflicts become the engine for social change. The aforementioned discussion about the country highlights numerous groups which seek resources, status, and/or power from the existing governing structure and also the international community. Transparency International, a global NGO, currently ranks Angola 163 out of 168 in transparency in governance (Transparency International 2015). This "cloak" allows for those in positions of power to operate in a manner that does not allow full disclosure of the activities of government to the people or the international community thereby thwarting genuine attempts to correct the problems of corruption, abuse, and civil/human rights abuses in the country. With proper training, accountability, and the rule of law and justice in place, the issues that plague the country will be resolved. This, however, will not be an easy feat, and conflicts, which challenge the leadership and the allocation of goods and services in the country, will continue to evade the country's real chances of true democratic governance, and only until proper recognition of civil rights as designated by the international

community are recognized will proper governance free of repression and conflict occur.

### India

The most significant human rights problems found in India were security force abuses, which also included torture and rape; corruption, which contributed to ineffective responses to crimes against women, children, and members of castes or tribes particularly in the form of trafficking; and also societal violence based on gender and religious affiliation. These civil and human rights abuses persist because of a lack of accountability and the creation of an environment which fosters impunity by government officials.

Evident in India are examples of group conflict theory. In Northeast India there are several separatists' movements such as the Kashmiri Movement, the Sikh Insurgency, the Jammu Movement, and the Maoist Insurgency, which are all groups seeking autonomy from the Indian government (U.S. State Department 2015). A particular law that has been utilized to deal with the insurgency movement is the Armed Forces Special Powers Act (AFSPA), (PUDR 2015) which was implemented initially in August 1942 by the Viceroy of India to suppress the movement started by Mahatma Ghandi and Jawharlal Nehru entitled the Quit India Movement. Both the movement and the AFSPA led to a number of civil and human rights violations which included the imprisonment of Ghandi and Nehru and the flogging, arrests, and killing of protesters at the behest of Lord Linlithgow, Viceroy of India. After India's independence from Britain in 1947, Prime Minister Nehru fought against insurgencies, particularly those led by the Nagas. The rebellions of the Nagas led to the upgrading of the AFSPA ordinance as implemented by the British Viceroy to that of an act of parliament in 1958, led by Nehru (Peer 2014).

The implications of this once colonial policy still reverberate today in India. This act gives Indian soldiers exemption from punishment in those areas rife with insurgent groups seeking autonomy from the Indian state. Conflicts carried out between the government and separatist groups such as the United National Liberation Front in Manipur eventually led to the group receiving statehood in 1972. Although some level of autonomy was granted and more resources allocated, rebels still sought further independence from India. The creation of the People's Liberation Army and other insurgency groups emerged with the AFSPA being reinstated in the Manipur area in 1980 (Peer 2014).

This historical background of the creation of the AFSPA and how the law has been utilized in areas that are considered to be conflict prone or susceptible to unrest shows how civil rights and human rights can be violated. More importantly, the groups that usually suffer from these violations are women and children. *The Country Reports on Human Rights Practices* indicates that "rape, domestic violence, dowry-related deaths, honor killings, sexual harassment, and discrimination against women remained a serious societal problem" (U.S. State Department 2015). There are reports of trafficking in persons, including bonded and forced labor of children and adults, and trafficking of adults and children for prostitution have also been reported as a widespread problem in India.

One of the fundamental tenets of United Nations Commission on Human Rights (UNCHR) Declaration is the respect for integrity of the person with freedom from unlawful or arbitrary deprivation of life. There are numerous reports which claim the Indian government or agents thereof violated this fundamental right. Examples include the apprehension of Irom Sharmila, who was in police custody for 15 years for the violation of a criminal statute that makes suicide illegal and custodial deaths of Shahik Hyder, Nakk Padma, and Swetang Patel (U.S. State Department 2015; Peer 2014). There have also been reports of disappearances as a result of failure of police to file arrest reports and the request of bribes by officers in order for families to receive information about the status of a detainee. There are also stories from individuals such as Hem Mishra, a student activist who exposed failures of the government and was arrested by the Maharashtra police in August 2013 on the charge of being a Maoist courier (Dahat 2015).

Additionally, there have been cases of abuse by law enforcement officers of individuals who are members of banned organizations that are forbidden from operating in the country due to the passage of the Unlawful Activities Prevention Act. The People's Union for Democratic Rights, an organization founded in 1977 in Delhi, has worked tirelessly to bring justice to the numerous civil rights abuses in the country (PUDR.org 2015).

Conflict in India will continue to persist, and varied groups will continue to seek recognition and impress their demands upon the government and also the international community until basic human and civil rights are recognized in the country of India. India has a long sordid history which has effectively limited and, in some cases, ignored the basic fundamental rights of particular groups within their society. Although the caste system is no longer in use, some groups such as the *Dalits* continue to be persecuted and ignored. This does not go without saying that the women and children who comprise this group are the recipients of a highly unusual amount of discrimination and marginalization. Other groups that seek recognition and some level of participation in the decision making process have been more organized in scope. Although there is organization among these groups, there is still some apprehension by India and also by the international community to some extent based on the belief that some separatist groups in the country have ties to terrorist extremists in the region. These groups, however radicalized they are or may be perceived to be, are participating in conflicts that are more organized. The theoretical postulations pertaining to conflict theory, particularly Glaser's assessment of group conflict theory, are applicable to India. Glasser concedes that the competition between racial groups and nonracial groups for that matter exacerbate over the scarce resources in society. This competition in India is that of struggle over political, social, and economic resources. This placement of one group – or some groups – in society vis-à-vis other groups in society affects how those groups approach decisions about the allocation of political, social, and economic costs and benefits (Glasser 2003).

**Russia**

The escalation of Russia's human rights abuses became more pronounced in 2014 with the illegal occupation of the Ukraine. Since that time, there have been numerous reports of human and civil rights abuses of Ukraine citizens residing in Russia. Individuals such as Nadiya Savchenko and Oleh Sentsor were both convicted on charges of terrorism. Nadiya Savchenko was charged with the death of two Russian journalists that were hit by mortar fire during a skirmish at a Ukrainian checkpoint. Although recently pardoned, she was sentenced to 22 years in a Russian prison (Pearson 2016; U.S. State Department 2015). Oleh Sentsor, along with others, was arrested after the March 2014 annex of the Ukrainian Black Sea Peninsula by Russia RFE/RL 2016a; U.S. State Department 2015. Sentsor was accused and convicted of terrorist attacks around Crimea and was sentenced to 20 years in prison.

The issues that were mentioned previously are not the only instances of human/civil rights abuses in the country. Some additional problems over the past year include restrictions on freedom of expression and the ability to choose one's government; restrictions on assembly, media, internet freedom, and association; and measures to repress political dissent. In addition to the suppression of the rights of citizens of the Ukraine, Russia has also systematically thwarted the activities of nongovernmental organizations (NGOs) by adopting laws that would prevent their work. Radio Free Europe/Radio Liberty reports spot inspections of nongovernmental organizations across the country. These organizations that receive foreign funding must register as foreign agents. The law that requires this reporting was adopted in 2012, and there are penalties applicable to the violation of the law ranging from a fine up to $9,300 or 300,000 rubles to prison terms of up to two years in criminal cases. As it pertains to administrative cases, organizations can be fined up to $15,500 dollars or 500,000 rubles. There have been seven administrative cases reported thus far where NGOs have violated this law, and there are at least 40 cases reported against organizations that were formally warned of the need to register as foreign agents (RFE/RL 2016; U.S. State Department 2015).

Coupled with the violations of rights of NGOs, many of which operate within the country to ensure that the basic civil and human rights of the citizens and migrants are maintained, are the violations of those who identify with the lesbian, gay, bisexual transgender, intersex community (LGBTI). The government has enacted laws to ban any "propaganda" of nontraditional relations to minors. Two such NGOs which operate within the borders of Russia to protect the rights of the LGBTI community, Side by Side and Coming Out, were fined 500,000 rubles each for either dissemination of propaganda or receiving funding from a foreign government (RFE/RL 2016; U.S. State Department 2015).

Overall the government has been complicit in not persecuting public officials, thereby fostering a climate of impunity. To substantiate this point, in areas where reports indicate high levels of human rights violations perpetuated by regional authorities, it is believed that the national government has done little to no investigations to correct the problems. The State Department has provided citations of torture and cruel and inhumane treatment of prisoners or suspects in custody. The use of abuse by police has been reported by former law enforcement officers and human rights organizations. The forms of torture utilized are "electric shock, suffocation, and stretching" (U.S. State Department 2015; Human Rights Watch 1999; Sweeney 2006; Karush 1999). Individuals such as Yuriy Yatsenko, a Ukrainian law student; Sergei Nazarov of Tatarstan; Murad Magomedov, a lawyer defending a terrorist suspect; and Vladimir Kara-Murza have all suffered civil and human rights violations at the hands of authorities or groups complicit with authorities (U.S. State Department 2015).

The aforementioned instances of abuse provide some examples of the types of torture faced by those in police custody before conviction is rendered. It also highlights the types of abuses suffered by those working on behalf of the accused to ensure a fair judicial process. However, there are also those who suffer within the Russian prison systems, those convicted of ordinary crimes, and also those considered political prisoners, some of which have been previously discussed.

In conclusion, the applicability of conflict theory to Russia in regard to civil and human rights is evident across a broad spectrum. It encompasses the examination of the violation of rights of foreign nationals, particularly those of Ukrainian origin to those within the country as far north as the Caucus region. Furthermore, those groups that seek to express themselves and be afforded some basic protections as it relates to their sexual proclivities and lifestyles have been targeted and harassed, and lastly the myriad of organizations working on behalf of those marginalized groups in society are also stymied, thus making it difficult for any true discussion to occur that will lead to a policy that will protect such groups.

## Conclusions

It is difficult to determine the direction of other countries as it pertains to civil rights at this time. While there are international protections in place as have been agreed to by many nations, abuses still continue. As long as the need for power, control, and greed outweighs the need for peace and civility, the obtainment of civil rights in other countries will be waged through long, hard fought battles. Conflicts of some sort will always exist as long as there is competition for scarce resources, but in this period of the world's political and social unrest instead of just fighting for basic freedoms, citizens are having to fight terrorism in its many forms. What is evident no matter which country is examined, women and children tend to suffer more harm; therefore, more laws must be enacted to protect those disenfranchised groups. Public administrators must be given the authority to legally and politically enforce the laws to ensure that the rights of citizens are not overlooked.

## Synonyms

Administrative civil servants; Bureaucracy; Civil servants; Civil service; Managers; Officials; Political

## Introduction

The purpose of this entry is to outline some important trends and features of civil service development in Kazakhstan over a period of more than 20 years from 1995 to 2018. It reviews regulatory changes, the role of the civil service body, and composition of the civil service. The following basic arguments are brought to the fore.

*First*. Since independence in 1991, Kazakhstan has undergone a major political, economic, and social transformation in its quest to join 50 and then 30 most competitive countries in the world (Janenova and Knox 2017). Kazakhstan's institutional reforms include changes to constitutional order, state organization, and management system, refining of its development objectives (OECD 2017a). While some "further reforms were introduced and at times previous ones were countermanded" (Ibid, 53), the civil service consistently has been both "the subject and the object of change" and "an arena and an instrument in the simultaneous pursuit of a range of values" (Morgan 1996, 227, 229). This could be illustrated by the number of successive legal instruments among them civil service laws, ubiquitous ethics, and anti-corruption decrees, codes, laws, and programs as well as various provisions related to modernization of public administration. These legislative activities should be viewed within the context of a succession of numerous strategic documents which outline the country's political, economic, and social objectives for several decades in advance and also provide very concrete steps toward "accelerating the modernization agenda" (Janenova and Knox 2017, 2).

*Second*. Official sources are distinguished among three key stages (1992–1997; 1997–2012, 2012–present) in the development of Kazakhstani civil service (CSA-AC 2018). While each stage is signified by adoption of national political strategies, programs, and supporting legal instruments, which seem distinct by the title and year of their adoption, nevertheless, such a linear sequence of reforms is misleading. The analysis shows that while each stage contains an important aspect concerned with improvement of civil service, reform stages have pronounced similarities in their objectives which are principally concerned with depoliticization and professionalization of the civil service. This resemblance of reform objectives could have various explanations including "the fact the earlier reforms have never reached their objectives, or perhaps they were too premature and ahead of their time, or perhaps they were cut short in the process of implementation, or perhaps some aspects of the reforms were only formal declarations that were not meant to be practiced at all" (Bakenova 2008, 95). Because immediate revolutionary changes in civil service development are not feasible and recurrence of the same objectives is only a sign of such a difficulty, we suggest that there is one permanent and continuous reform, starting with the transition from a socialist system. This period of reform has been long enough to complete some important tasks which we only start to understand now, an overview of which we present here.

*Third.* Lacking "deep historic roots" (Alba 2001, 93) with an average of just over 10 years of service, Kazakhstan boasts some of the youngest bureaucrats relative to, e.g., OECD countries. These civil servants could hardly be called

autonomous given that they have to endure politicians' interference in administrative operation and frequent mingling with the rules of their organization. Though, as some experts argue, this intrusion is not as effective as hoped. While higher-ranking officials develop "decent" programs, the rest of the bureaucracy appears to be "not suitable for the implementation, assessment, and oversight" of these initiatives. In other words, "Kazakhstani officials" keep failing "to create the executive mechanisms that would implement their decisions." That is why every 3 years or so, they are impelled to introduce yet another administrative reform (Satpayev 2016, 3).

*Fourth.* The Kazakhstani civil service exists in a paradox, in that civil servants on one hand are expected to be responsible for their actions and non-politicized, and yet political superiors relying on "'hierarchical' surveillance" expect them to be obedient, subject to responsibility, and politicized (Spanou 2001; Toonen 2001, 191).

The use of new public management ideas with strong emphasis on performance results and competition highlights the desire to define a clear role for civil servants in the "quality implementation of economic programs, provision of public services," which make them responsible and accountable, professional, and independent (Adilov 2015; Abdrasilov 2015).

However, as experts point out, the cascade of reforms puts tremendous pressure on civil servants to reaching political goals, creating an "overload and hence no opportunity for evaluation and reflection on policies that were effective or failed" (Janenova and Knox 2017, 8). This in turn "hinders the capacity of officials at the local and central government levels to do their jobs," putting strains on financial, human resources, and administrative organization, generating inefficiency and ineffectiveness in implementation of public policies, and let alone giving even more opportunity for politicians to be dissatisfied with civil servants working under them (OECD 2017a, 56; Adilov 2015).

A subsection of political elites has been able to maintain its established privileged positions against the instability of administrative civil servants by means of reforms and "super-centralized" system of control (Satpayev 2016, 3; see also OECD 2017a, b; Janenova and Knox 2017). The more unified and centralized political control is, the easier it is to introduce new approaches to the management of public services (Walsh 1995). However, by reducing the reform objectives to technical criteria and economic rationale, along with punitive policing measures to curb corruptive behavior in the absence of strong legal culture and respect to the process, perpetuates the reasons why in Kazakhstan the demarcation line between the political and administrative spheres is virtually nonexistent.

In a first step, we provide an overview of regulatory framework of civil service development since Kazakhstan's independence, followed by the latest changes in civil service structure and numbers. The final section discusses the implications of changes introduced to the civil service agency.

## Civil Service Regulation 1995–Present

After the collapse of the Soviet Union in 1991, Kazakhstan, as all other Soviet republics, relied on the preexisting Soviet bureaucratic and administrative machinery (Bhuiyan and Amagoh 2011). One of the important goals was to reform the politicized bureaucracy with its ideological commitments to communist political regime. In doing so Kazakhstan in 1995 adopted concurrently with its second Constitution, the Decree on Civil Service. If the Constitution outlines legal and institutional principles of equal access to employment in public administration and non-discrimination, the decree declared that civil service at all levels is a unified and professional sphere separate from general employment. The decree puts limitations on some of the constitutional rights of those who are in civil service including prohibition to strike, engage in entrepreneurial activities, form or have membership in political parties or be elected to representative institutions of central or local levels. Yet the decree also guaranteed to civil servants' rights including career growth based on qualifications, legal and social protection, social security and

pension, and resolution of employment disputes. These limitations and guarantees have been essentially preserved as of now.

The 1990s, however, proved to be challenging in making the constitutional rights and decree's provisions work. Like other former socialist states in this period, Kazakhstan experienced dramatic transformations in the state structure, political instability, poor economic indicators, mass privatization, and substantial emigration to say the least (Verheijen 2003). It is not entirely surprising that radical changes that were introduced in public administration did not completely correspond to the serious obstacles. Formal rules ran parallel to some unmotivated civil servants, distorted performance incentives and low salaries, and persistent politicization. Higher turnover, clientalism, nepotism, patronage, and various other informal practices including deeply rooted corruption in public administration greatly contradicted the legal principles of the decree (Baimenov 2000). Even the decree itself posed contradictions to the stated objectives with its 5-year contract for civil servants and spoil system formalized in Article 29, which outlined a process for mandatory resignation of subordinate civil service staff upon resignation of their superior. These rules undoubtedly only promoted the transient, temporary nature of civil service (Bakenova 2008).

In 1997 Kazakhstan announced its long-term program, strategy Kazakhstan 2030, a major policy initiative outlining long-term priorities among which is establishment of professional public administration. The concrete mechanism for implementation of the program became adoption in 1999 of a new Law on the Civil Service which had been repeatedly revised (Ashimbayev 2013; Bakenova 2008). The drafters of the law left out damaging spoil system rules and proceeded to separate political and administrative positions. Further to ensure stability and continuity of administrative civil servants against frequent rotation of political civil servants, in 2007 the senior administrative position of responsible secretary was established. However, ironically, the officials in this position turned to be themselves subject to continuous political pressure and turnover (Nursha 2015).

To fight corruption in public administration, Kazakhstan adopted since 1997 a series of instruments including Law on National Security 1998, Law on Fighting Corruption 1998 and 2015, the Code of Ethics for Civil Servants 2000 and 2015, consecutive State Programs on Fighting Corruption, and Anti-Corruption Strategy 2025. Notwithstanding all these measures, Kazakhstan among 180 countries in the Corruption Perceptions Index of Transparency International consistently scores since 2012 between 26 and 29 points (on a scale of 0 to 100, with 0 being highly corrupt) with slight improvement in 2017 – 31 points (Transparency International 2018; Janenova and Knox 2017).

While Kazakhstan's efforts in reforming civil service were praised by the international community (e.g., World Bank in 2002), nevertheless meritocratic principles remained theoretical as opposed to being "a solid practical rule" (Nazarbayev 2017, 377). As President Nazarbayev himself acknowledged: "While in 2000 Kazakhstan was able to develop its own model of civil service. . .there were significant problems among them insufficient objectivity in the work of [selection] committees, predetermined results of selection process, disregard of lawful process of appointments, and persistence of spoil system on all levels of public administration." These deficiencies required "radical modernization of the existing system of public administration" (Ibid).

Starting in 2010 Kazakhstan undertook several policy initiatives including *Strategic Plan of Development of Kazakhstan till 2020*, followed in 2011 by the approval of the *Conceptual Framework of New Model of Civil Service*. In 2012 the president announced in his meeting devoted to the independence of Kazakhstan that the program adopted in 1997, *Kazakhstan 2030*, had been successfully completed ahead of time, especially in socioeconomic development (Kazakhstan had achieved a place in the ranks of upper-middle-income countries) and international policy objectives. The next ambitious goal would be strategy *Kazakhstan 2050* with the aim of joining the top 30 developed countries of the world (Nazarbayev 2012).

As part of the state strategy *Kazakhstan 2050*, in 2015 the state program *Plan for the Nation* introduced *the 100 Concrete Steps on Implementation of Five Institutional Reforms*. The five institutional reforms include among others establishment of a modern and professional civil service. The *100 Concrete Steps* was supposed to be implemented within a minimum of 10–15 years and directed toward cure of systemic illnesses of public administration as opposed to its symptoms (Germenchuk 2016). In the same year was adopted the Law on Civil Service which is an updated and detailed version of its predecessor, Law on Civil Service 1999. It was described by international commentators as a law that "entirely renovates the legal framework of the civil service" (OECD 2017b, 31).

Review of the development of civil service in Kazakhstan underscores that professional, meritocratic, patriotic public administration personnel serving above all its people and the state have been always the most important agenda items for political leadership. However, the threshold of tolerance of ineffective and inefficient bureaucracy has been also significantly higher since need for *decisive* and *radical* reform came only after 20 years. One may argue that the time lag was due to the challenge of finding the *right* solution. Meanwhile, as experts point out, "the same problems" continue to exist. Not least 99% of the solutions for reforming the bureaucracy has already been part of earlier laws or already established organizational structures. Overall, the problem has never been in imperfect laws as much as in the failure of their implementation and non-compliance on part of individual officials and public administration bodies in general (Chebotarev 2015; Tatilya 2013).

How does the present civil service model differ from preceding systems outlined in earlier laws? Some experts argue that since unified structure and general division into political and administrative civil servants have been preserved, the present model is not radically new (Tatilya 2013). Nevertheless, there are a few important changes that were introduced, and we discuss those including what has remained of the civil service structure from 1990s.

## Present Civil Service Model

The Law on Civil Service 2015 preserved two types of civil servants: political and administrative. Political civil servants continue to be appointees, though the law also allows for their election. On central and regional levels, they are ministers, deputies, regional governors/akims, and deputies, as well as other positions determined by the president. A political civil servant's role is to determine objectives of the organization or region under their authority, to make decisions pertinent to the implementation of state policies and to evaluate implemented programs.

Modifications occurred in the structure of administrative civil service which is subdivided into two corps, A and B.

Corps B civil servants fill in positions in central and local public administration and are recruited via open competitive process or internally. Given that corps B civil servants as a rule start their career at the entry level, this makes it possible to say that Kazakhstan moved to a *career-based* model. However, it is rather a mix of a *career* and a *position* models.

Corps A are civil servants in managerial positions on central and local levels (e.g., responsible secretaries, heads of central, regional, and district executive apparatus including akims of lower level). These are analogous to senior executive service positions and are responsible for execution of concrete state policies developed by political civil servants. In other words, corps A serve as a medium between adopted strategic decisions and their execution.

Candidates to corps A are selected internally, among administrative (corps B) civil servants as well as via open competitive selection among talented representatives of the private sector. This is supposed to create the so-called social lift for qualified citizens of Kazakhstan. Special requirements, including reference letters from only designated categories of political and administrative civil servants as well as heads of national companies, however impose limitations on this objective.

Candidates to corps A, after passing special qualification requirements, are selected

into reserve list of candidates by the National Committee under the president of Kazakhstan. From the list, names of the candidates are chosen by government bodies (e.g., central ministries, regional public administration) to fill in vacancies. The obvious improvement since 1990s is that names of individuals accepted to the reserve list of corps A are publicly available on a government website. This transparency measure reinforces the competitive selection process developed in the previous 5 years.

After probation period of up to 6 months, civil servants of corps B continue to be hired on an indefinite period, subject to regular performance review. Corps A civil servants are limited to two consecutive terms of 4 years each. It is too early to assess the effect of such a limited service contract since the first hires to the corps are still in their second term. (The first draw to corps A was made in 2013.) Contract appointments are part of the general labor law which the current Law on Civil Service makes applicable to civil servants. This departure from the decree of 1995 triumphant separation of civil service from general employment sphere has not gone unnoticed. Experts point out that inclusion into civil service law categories and approaches of general labor law is not proper given the public nature of civil service employment (Podoprigora 2009). Yet, at the same time, this is not unique and has been modeled on OECD practices that progressively moved to fixed term senior executive appointments that are subject to performance review and individual contract requirements (OECD 2003).

One important element which has remained is noncompetitive appointments of politicians and political civil servants, ex-judges, and international civil servants (citizens of Kazakhstan employed in international organizations) into corps A and B on the discretion of the president. In addition, civil servants of corps A could be appointed without competitive selection positions in corps B. These noncompetitive appointments are nothing else but formalized politicization of administrative sphere (Emrich-Bakenova 2009).

One alteration in the current law is to allow heads of public administration to hire foreign nationals to certain positions within public administration, albeit they cannot be civil servants or be in leadership positions. Foreign candidates should undergo special security clearance, including approval by the National Committee. The main purpose of such innovation is to attract foreign specialists Kazakhstan lacks. This practice has already been capitalized by national companies. However, employment of foreign nationals in public administration is controversial given this may create obstacles to promotion of Kazakhstani specialists (Isabayeva 2015; Kapital.kz 2015).

Previously human resource was managed individually by public administration bodies. At present it is centralized under *e-kyzmet* electronic government system that provides online complete information regarding civil servants and positions they fill in on central and regional level. This system also allows to oversee obligatory mobility of corps A and B civil servants from center to regions, across regions, from one public administration body to another on central and/or local levels. The objective of this mobility is for effective use of professional skills. However, some argue that it is done more for the effect of inviolability of central control (Nursha 2015).

Centralization of human resource presumably is supposed to put an end to spoil system and various practices used by higher-ranking civil servants on central, regional, and local levels. These include "moving" from one position to another with a "team" of selected civil servants, practices of patronage, and favoritism that have damaged the image of professional public administration. The centralization is also a response to exert control over regional political civil servants who tended to carve special influence over financial, material, and human resources under them. Exemplary is the case of high-profile ex-akim of Atyrau region (an important oil producing region), who is subject of an international search warrant since 2013 for organized crime, corruption, and abuse of authority while in civil service (Nursha 2015; Forbs 2013).

Promotion of civil servants is subject to merit and performance results. Political civil servants are subject to a vertical system of evaluation based on position and line of accountability. Corps A civil servants are evaluated by their direct

supervisors who are responsible for their appointment and dismissal based on the results of their performance and in accordance with their contractual responsibilities, professional competency, and personal qualities. Corps B civil servants are evaluated by their supervisors annually based on averaged evaluation results in the course of the year, assessment of individual work plans, and confidential evaluation by subordinates or peer evaluation. The evaluation results of civil servants are subject to approval by an Evaluation Commission within each government department. Unsatisfactory evaluation results lead to contract termination for corps A civil servants and for corps B downgrading in position or dismissal in case of two subsequent years of unsatisfactory performance results.

While remuneration (basic salary, salary increment, and/or bonus) has never been an issue for political civil servants, with exception of the fact that they are rewarding (Urnaliev 2015), the administrative civil servants' wages continue to lag behind (Informburo 2017). Corps B wages 30% lower than the average salary in the country and twice and even three times lower than, for example, in specific sectors of economy, e.g., construction, financial, or insurance spheres. Wages also differ on central, regional, and local levels of public administration. Typically, the further one is from the center the lower the wage (CSA-AC 2018; Kursiv.kz 2018).

In 2018 Kazakhstan introduced as pilot project a new pay system in several public administration bodies on central and regional levels. The new model consists of constant point-factor scale pay, when salary size depends on the nature and difficulty of work performed and variable factor bonus pay, which depends on evaluation results (CSA-AC 2018; Belyaev 2017). This new system of payment is supposed to eliminate redundancy in positions, directly relate financial reward to individual results and achievements, increase organizational efficiency, and decrease wage gaps between center and regions (Zhylkyshiyeva 2018). Official sources already report positive results of the pilot project including halving turnover in local public administration and simultaneously increase the number of applicants for civil service positions from two candidates to up to 30 per vacancy (Zakon.kz 2018a, b).

Complex performance assessment systems in public administration with the aim "to establish a dialogue on objectives and results" require establishment of transparent procedures (OECD 2003, 14). Given that performance review of civil servants in Kazakhstan is conducted by special committees, membership of which is determined by the heads of public administration organizations whose civil servants are under review, experts say there are serious questions regarding member's objectivity. This is particularly so because heads of public administration are frequently found to be lacking professionalism and even are prone to fail review themselves (Adilov 2015). In other words, as argued more than a decade ago, "outstanding performance is different from the standard remuneration system and inevitably is subjected to the judgment of the management of individual institutions" (Meyer-Sahling 2006, quoted in Emrich-Bakenova 2009, 730).

## Civil Service in Numbers

Politicians stress that civil service in Kazakhstan should be compact. This has been an objective since the mid-1990s. Over time, the number of civil service positions has fluctuated with the lowest recorded in year 2000, total about 68 thousand positions, and the highest in 2007, just over 104 thousand positions. However, the overall number stayed within the range of 90 plus thousand over the last several years (see Table 1). In 2018, there were 98,886 positions registered across all levels of public administration. However, fewer positions that year – only 91,830 – were actually filled in (CSA-AC 2018).

With the population of Kazakhstan in 2018 just over 18 million, there are around 180 residents per civil servant (Astakhov 2018) excluding regional disparities. Densely populated South Kazakhstan, with close to three million residents, has fewer than 5 thousand civil servants, whereas Kostanai region, with one-third as many residents, employs close to 4 thousand civil servants (CSA-AC 2018). More than 50% of civil servants work for

**Civil Service Development in Kazakhstan, Table 1** Number (rounded) of positions available in civil service (CSA-AC 2018; kyzmet.gov.kz 2018; Baimenov 2014; Emrich-Bakenova 2009)

| Year | 2000 | 2003 | 2007 | 2012 | 2018 |
|---|---|---|---|---|---|
| Number of positions | **67,500** | **79,000** | **104,000** | **97,000** | **98,500** |

the central government; fewer work in local governments for lower wages, as discussed earlier, but they have significant responsibility in the provision of diverse social, economic, environmental, public protection and safety services. This is a considerable concern and suggests, contrary to the present centralization tendency of personnel system (as discussed earlier), the need for decentralization (see OECD 2017a).

Official sources indicate that it is only at first glance the number of civil servants in Kazakhstan is small (constituting only 1.1% of economically active population). In contrast, in OECD countries it is 18%. But when civil service numbers are calculated together with all public organization employees, whose number is 1.4 million, Kazakhstan then even exceeds OECD, totaling 20% employment in the public sector (CSA-AC 2018).

Thus, there is room for even further reduction in the number of civil servants. By transferring some public administration functions into competitive environment, it is planned to reduce number of civil servants by 4,500 which would save about 5.5 billion of tenge annually in state budget (Saktaganova 2018).

In 2013 drastic reduction already happened in the number of political civil servants. Their number was reduced more than eight times, from 3,271 to 400 (Baimenov 2013a; Nazarbayev 2017). Currently political civil servants and corps A comprise about 1% of all the civil servants in Kazakhstan (see Table 2).

The small number of political and managerial elite relative to administrative civil servants however is a dubious indicator. On one hand it is a sign of depoliticization and professionalization of civil service. Yet on the other hand, the delineation of political and administrative spheres is fluid in Kazakhstan given that political elites can move formally to administrative positions, as discussed earlier. In addition, while average years of service among all categories of civil servants is about 11 years, one may note an obvious paradox (see Table 3). When political and managerial elite are in service on average close to 18 years while administrative staff less than 11 years, there is an issue not only with stability of 99% of civil service but questionable idea of their professional and autonomous status. If anything, we see here peculiar reversals of roles when politicians are the most stable and professional by virtue of them being so long in the system, whereas administrative civil servants are by comparison transitory and unstable.

**Civil Service Development in Kazakhstan, Table 2** Civil servants by category and average years of service in 2018 (kyzmet.gov.kz 2018)

| Category | Number | Average years of service |
|---|---|---|
| **Political** | **422** | **17.7** |
| **Corps A** | **493** | **17.4** |
| **Corps B** | **97,971** | **10.6** |

**Civil Service Development in Kazakhstan, Table 3** Civil servants by age in 2018 (kyzmet.gov.kz 2018)

| Age | >30 | >40 | <40 |
|---|---|---|---|
| **Average = 38.9** | **26%** | **31%** | **42%** |

The average age of civil servants has changed only slightly (by 1 year) in the last 10 years constituting just about 39 in 2018 (kyzmet.gov.kz 2018; Emrich-Bakenova 2009). More than 50% of employees are in their 20th and 30th years. As official sources acknowledge, in comparison to OECD countries, Kazakhstan was able to avoid problems of aging of human resources (CSA-AC 2018). Notably, current civil service law specifies that reaching pension age is a basis for termination of employment. Administrative civil servants are subject to a 1-year post-pension age contract

prolongation, whereas political civil servants may work up to 5 years post their retirement age subject to the decision of the president.

The problem with numerous amateurish administrative civil servants is also exacerbated by their instability. While outrageous turnover among civil servants, 20% to over 30% and even over 50% in individual public administration agencies in 1990s, is not the case presently, nevertheless this has subsided only in the last several years from 11.2% in 2015 to 6.2% in 2017 (CSA-AC 2018; Baimenov 2000; Emrich-Bakenova 2009).

What could be concluded from the review of civil servant numbers in Kazakhstan is that continuous drive to downsize public administration and civil service in particular is contrary to perceived stability, making center versus region disparities more obvious. Secondly, small and stable group of political and managerial elites is in stark contrast to large, unstable, and young administrative bureaucracy.

## The Agency on Civil Service Affairs and Anti-Corruption

The Civil Service Agency (CSA) was established in 1998 by the president's decree with the purpose to oversee implementation of a unified civil service policy; ensure proper selection, hiring, promotion, and employment conditions of civil servants; as well as via disciplinary committees oversee and make recommendations regarding various cases concerning ethics issues.

In 2011 the CSA developed a policy, mentioned earlier, Conceptual Framework of New Model of Civil Service (Kazakhstan 2011), which formally symbolized a new stage in the development of civil service. This framework implemented various measures including more rigorous competitive selection, optimization of civil service positions, and establishment of corps A and B. As part of a collective effort with United Nations Development Programme (UNDP), the CSA in 2013 also established Regional Hub of Civil Service in Astana (ACSH). This Hub is designed as an institutional basis for all countries of the former Soviet Union to exchange experiences and knowledge in the sphere of civil service (http://www.astanacivilservicehub.org).

However, over the years the CSA progressively has drawn criticism. Tension has risen as a result of its sheepish position with respect to political civil servants (heads of public administration bodies) when overseeing disciplinary cases against them brought by administrative civil servants. The agency was also heavily criticized by the president himself for failing to institute meritocratic selection process and allowing to fill in civil service positions on the basis of pressure from leaders of public organizations (see Emrich-Bakenova 2009).

The leading role of CSA in the civil service reform became even more questionable in 2013 after it oversaw the first competitive selection test for candidates into corps A. One hundred and fifty candidates (30% of all candidates) for the positions in the elite corps failed the test. Among those who failed were high-ranking political civil servants including responsible secretary, heads of local public administration, and heads and members of various committees (Nomad 2013). Candidates, it appeared, failed to show even the most basic knowledge of administrative law (Baimenov 2013b).

Again the CSA drew the president's criticism. The president stated that the problem of the failure of candidates to corps A were not the candidates but the test itself: "The issue of competitive selection is the question of the future. We should analyze it" (Prilepskaya 2013). Others even called this selection test "another experiment" that overwhelms civil service since use of various tests is not a panacea against corruption. They called to abolish the test because "so many decent people were not able to pass them. . . The test itself generates corruption" (Nursha 2015, 19; Ashimbayev 2013). However, others were more adamant, demanding cancellation of contracts with those who were not able to pass the stage of the selection process (Peruashev 2013).

At any rate, after this scandal, CSA, as some experts pointed out, focused primarily on its internal mistakes. The rules of competitive selection

process to the corps A were redefined and overall simplified. The activity of civil service reforms also somewhat slowed down (Nursha 2015).

The CSA never was an independent civil service organization. Directly accountable to the president of Kazakhstan, the CSA had been under the strong influence of the Administration of the President (AP), a constitutional body with exclusive presidential prerogatives (OECD 2017a; Emrich-Bakenova 2009). It is AP that has a broad array of functions in managing various issues related to civil service development specifically and reform implementation in general leaving to the CSA to act within the "narrow corridor" of state programs and strategies (Nursha 2015, 15). One of the many CSA higher-ranking officials once pointed out that the agency started to give up its initiatives due to the clash of two systems, civil service and political. This is why the "Agency cannot control implementation of reforms. . . perhaps because it avoids straining its relationship with political apparatus" (Ibrayev 2014; Nursha 2015). The CSA, in the absence of actual power and influence, was used by politicians to transfer the blame for mistakes and omissions in civil service development.

Given the rampant corruption within public administration, continuous violation of ethics of civil service, AP recommended in 2008 to somewhat elevate role of CSA by giving it broader control functions in cases of disciplinary misconduct (Emrich-Bakenova 2009). However, as the president of Kazakhstan wrote, "in the new, extremely challenging stage of country's development there is no place to piecemeal measures. The work against corruption should be systemic"(Nazarbayev 2017, 379). To proceed with this, in 2014, CSA was abolished by presidential order with immediate establishment, via unification of CSA and Economic and Anti-Corruption Agency, of the Agency on Civil Service Affairs and Anti-Corruption (ACS-AC).

In 2015 the CSA-AC was reorganized into the Ministry on Civil Service only to be reorganized again in 2016 into the CSA-AC. Even though the reasons for back and forth reorganization were not publicly announced, it came as no surprise that the Ministry essentially is accountable and responsible before the government, whereas historically civil service issues have been under the president of Kazakhstan.

Needless to emphasize that since its establishment in 1998, CSA and CSA-AC experienced continuous turnover of its leadership whose service in the position on average lasts 2 years. Altogether the "old" and "new" agency was guided by 12 different leaders.

Repeated reorganization of the agency and the continuous reshuffling of its leadership raise questions about the direction of civil service development. If in the early years, the CSA led the process of transforming the Soviet-style apparatus to a public service of a democratic system, the present CSA-AC in addition to overseeing civil service also has rather strong policing component in it and special entity, the National Anti-Corruption Bureau. Since 2014 leadership to CSA-AC comes with heavy background in law enforcement and experience in the financial police and the economic and anti-corruption agencies. The activities of the National Anti-Corruption Bureau, as law enforcement body, focus on identification, prevention, and pre-trial investigation of criminal corruption offenses. As some experts observe, the CSA-AC is referred to principally as an *anti-corruption* agency. Even the website of the CSA-AC only describes its history from 2016 onward. Meanwhile all mass of information about early years of the CSA related to reforms of civil service is absent. It is clear that the CSA was legally abolished, and the newly established entity was given a list of functions of two different state bodies. Yet, succession in the activities of state bodies is still relevant in public administration (Nursha 2015, 20).

Observers note that the more forces are concentrated on the special goal of fight against corruption, paradoxically, the more corruption activities are identified (BNews.kz 2018). A majority of those who were caught in corruption, according to CSA-AC, are political and corps A civil servants of central, regional, and local levels. The most scandalous corruption cases in the past 3 years brought to court among others ex-prime minister, ex-minister of national economy, political civil servants from AP, deputy minister of energy, and numerous top managers of the quasi-public sector (Zakon.kz 2018c, d;

Kazpravda 2017). Though pressured to show results, civil servants of corps B are also punished for mistake which at times may balloon into a corruption case even without corrupt intent (Kazakhstan Today 2013; Zakon.kz 2013).

## Conclusion

This entry has provided an overview of the development of civil service in Kazakhstan since independence. It argued that in the course of over 20 years, civil service has never failed to be an important agenda item for political consideration. Adoption of numerous legal instruments including civil service decree and two laws as well as a succession of strategic programs is an indication of politician's concern with making Kazakhstani bureaucracy meet world standards of professionalism and depoliticization, accountability, and independence.

Next, the entry also emphasized that pressured to show results, yet unprepared to act independently, predominantly young bureaucracy hinders, as it were, the implementation of development objectives and is continuously blamed for lacking these very same characteristics that politicians inspire to perfect.

Finally, the entry also emphasized that civil service development in Kazakhstan cannot be claimed to produce instant spectacular results, though undoubtedly there are improvements as review of regulatory framework points out.

# Civil Service Law and Public Personnel Management

Keith Boeckelman
Western Illinois University, Macomb, IL, USA

## Synonyms

Civil service; Human resources; Patronage

## Introduction

Public personnel management plays a central role in effective governance. Most nations have created civil service systems that attempt to promote merit and neutrality, viewing this approach as the best way to deliver public services effectively. Specifically, the civil service ideal involves protecting government employees from arbitrary decisions concerning hiring and firing or pays to promote good management and strong employee performance. The rise of "New Public Management" ideas in recent years has challenged civil service premises, however. For example, the "flexibility doctrine" emphasizes giving managers

more power and discretion to improve the bureaucracy's performance and heighten political responsiveness (Moynihan 2004).

In short, civil service systems are highly legalistic, while emerging alternative approaches are less so. Statutes, executive orders, and court decisions all shape the environment in which government employees work. Therefore, this entry examines the legal framework of public personnel administration, focusing on the US civil service system, primarily at the federal level, but also considering state and local governments. It begins by looking at major civil service statutes, starting with the Pendleton Act. It also reviews important laws and regulations concerning political activity of civil servants, veterans' preference, affirmative action, collective bargaining, and other matters. The following section considers constitutional law as it relates to civil service. Then, the legal and administrative implications of civil service reform are considered.

## Major Civil Service Laws and Regulations

The Pendleton Act of 1883 created the federal civil service. Prior to its passage, there was little systematic legal oversight of the public sector workforce. In the nation's early years, government officials were generally chosen from among the well educated and well connected. Although formal job protections did not exist, federal employment was relatively stable before the Jacksonian era. Upon becoming president in 1829, Andrew Jackson implemented the principle of "rotation in office," ushering in the patronage or "spoils" system of government hiring. While this approach attempted to democratize public administration, in practice it led to many problems. Chaos ensued each time a new president was chosen, a widespread perception that government was incompetent emerged among the larger population, corruption festered, and governments had to spend a great deal of time on staffing issues (Mosher 1968, 63). These latter pressures, in fact, led to the assassination of President Garfield, thus hastening the advent of civil service reform through the Pendleton Act. Its initial impact was limited, as the vast majority of federal employees were not covered, but over time presidents gradually expanded its scope.

The Pendleton Act's provisions included selection of politically neutral civil servants through open and competitive examinations; protection from political interference, including being fired for political reasons; and job tenure, based on the assumption that government service would be a career. Furthermore, geographic dispersal of civil servants, a bipartisan three-member Civil Service Commission responsible for overseeing the system, and an employee classification system were created under the Act (Warren 2011). Thus, it was essentially designed to make personnel decisions based on merit, not political favoritism.

In general, hiring in the federal civil service and in most state systems was based on test performance. The format of the tests has varied. From the nineteenth century to the 1980s, the federal government used general knowledge exams, such as the Professional and Administrative Careers Examination (PACE), supplemented with some more specialized instruments for certain positions. More recently, federal agencies have adopted a more decentralized hiring process, while the Office of Personnel Management has instituted a hiring system that emphasizes past experience and credentials. Pay was tied to one's position in a job classification system, such as the General Schedule in the federal government. In addition, the Federal Employees Pay Comparability Act of 1990 created a locality pay system to minimize differences in standards of living for federal employees based on how expensive it was to live in a particular locality. This law tried to make federal government pay more comparable to that in the private sector but largely failed.

State and local governments began to pass civil service laws during the same period, although spoils systems continued in practice. New York and Massachusetts were the first two states to do so, although most other states did not follow suit until the twentieth century. Many states created their civil service systems in the wake of the federal Social Security Act of 1935, however. It is obvious that patronage hiring lingered much

longer at the state and local levels and, by some accounts, continues today.

While the Pendleton Act created the basic civil service framework, it took many years to be fully implemented. Meanwhile, several other major laws regulating hiring and other aspects of the civil service followed. In 1888, the "rule of three," which required hiring administrators to select from the top three names from the eligibility list based on test scores, was established by rule. It was later codified through the Veterans' Preference Act of 1944. The Lloyd-LaFollette Act of 1913 applied civil service principles to the process of terminating employees requiring that they may only be discharged for cause after a probationary period and that they have the right to written notice and appeal. In interpreting the Lloyd-LaFollette Act, the Supreme Court has ruled that employees facing termination have a property right to their jobs in a series of cases that include *Cleveland Board of Education v. Loudermill* (1985). Thus, termination without a hearing is forbidden, as it violates employees' due process guarantees.

The Classification Act of 1923 further clarified the classification process, requiring that the pay of most federal agency employees must be determined within a system that provides comparable pay for comparable jobs. This law was supplemented by the Classification Act of 1949, which created new "supergrades" that dealt with low compensation and attendant recruitment/retention problems at the top levels of the civil service. In 1938, President Roosevelt issued an executive order for individual agencies to set up personnel offices.

The Hatch Act and subsequent amendments try to ensure the neutrality of the civil service by distancing government employees from political activity. The original law, passed in 1939, forbade civil servants from being actively involved in political campaigns. 1993 amendments to the Hatch Act further restricted political activity at work, including wearing campaign buttons. On the other hand, outside of work, civil servants are able to participate in and manage campaigns, support candidates, and raise funds from some organizational employees, as long as they are not subordinates. However, the updated Hatch Act prohibits running for partisan political office or using one's official position to influence elections (Warren 2011, 122–123). Most state and local governments also limit public employees' political activity, although the nature of these restrictions varies widely. Some are stricter than the federal guidelines, such as prohibiting voluntary contributions or allowing workers to express partisan views publicly (Nigro 2006). Most, however, allow campaigning and running for office while off duty.

In the realm of political influence outside the electoral process, the case of *D.C. Federation of Civic Associations v. Volpe* established that legislators are allowed to put political pressure on civil servants, but they must not yield to such pressure. Government employees are also subject to various conflict of interest laws and regulations. The Ethics in Government Act prohibits high-level administrators who leave government from lobbying or otherwise influencing the agency on issues in which they were previously involved. The Act also requires financial disclosure for top government employees (Warren 2011).

While civil service laws enshrine the principles of merit, usually defined as performance on a competitive, job-related examination, other hiring practices have emerged to meet social equity concerns. Specific examples include veterans' preference and affirmative action. The former began after the Civil War. It has strongly influenced the makeup of federal and many state civil service systems since World War I and especially during the period after World War II (Lewis 2016). Traditionally, veterans' preference added ten points to the merit scores of disabled veterans and five points for other eligible veterans on a 100-point scale (Lewis 2016). The Civil Service Reform Act, however, removed veterans' preference for members of the military who retired from the top ranks. Under the category rating system that replaced the rule of three, and which is described in more depth later in this entry, agencies must receive OPM approval to hire nonveterans over veterans in the same category. According to Lewis (2016), veterans were four times as likely to hold federal jobs as nonveterans by 2010.

Veterans' preference programs can affect both the makeup and the performance of the civil service. Veterans' preference likely reduces the number of women, Hispanics, Asians, and gay men in the civil service (Lewis 2016). While its overall impact on the quality of the civil service is difficult to measure, there is at least some evidence that veterans are less productive than nonveterans (Lewis 2016).

Since the 1960s, various presidents have instituted affirmative action programs through executive order. Many affect federal contractors, rather than the civil service directly. Given the historical prevalence of the "rule of three," explicit affirmative action plans have been hard to design, although many state and local governments have done so through various alternative hiring processes.

Through a number of decisions, the US Supreme Court has also shaped the law on affirmative action and equal employment opportunity. One of the earliest cases, *Griggs v. Duke Power Company* (1971) established that discriminatory selection procedures must be job related. While this particular case involved a private sector employer, it had important implications for public sector personnel management as well. Specifically, it required all employers to be able to justify hiring and promotion procedures that appeared to harm minorities' chances.

A number of affirmative action and discrimination cases relate to the civil service and public personnel administration. Many involve local government agencies, such as police and firefighters. For example, in *U.S. v. Paradise* (1987), the Supreme Court permitted the use of racial quotas in hiring decisions for the state police due to a clear history of past discrimination. In a more recent case, *Ricci v. DeStefano* (2009), the Court ruled that cities face a high burden of proof in declaring promotional tests invalid, even if they appear to discriminate against minorities.

While not necessarily inconsistent with merit principles, unionization has also shaped the operation of the civil service system. Public sector collective bargaining originally lagged behind that in the private sector. Nevertheless, in recent years, it has been the more dynamic sector for union activity. Although private sector collective bargaining was permitted under the Wagner Act of 1935, public sector employees were not allowed to unionize until the Kennedy administration in the early 1960s. The creation of the Federal Labor Relations Authority spelled out the specific powers of and limits on collective bargaining. Wages, benefits, and the right to strike, for example, are off limits. At the state level, collective bargaining laws vary widely, with a few states prohibiting it completely, while others allow unions more negotiating powers than exist at the federal level.

## Constitutional Law and Civil Service

Many Supreme Court decisions outline the constitutional rights of civil servants and the constitutional obligations they must observe (Rosenbloom and Chanin 2016). With respect to the latter, the Supreme Court ruled in *Harlow v. Fitzgerald* (1982) that civil servants could be held personally liable for violating a citizen's constitutional rights as part of carrying out his or her responsibilities. In the realm of rights of public employees, the First and Fourth Amendments have been in the forefront.

Efforts to restrict the free speech rights of public employees go back to the presidency of Thomas Jefferson. In *Rankin v. McPherson* (1987), the Supreme Court established that public employees could not be fired for speaking on a matter of public concern. In *Garcetti v. Ceballos* (2006), however, the Court ruled that First Amendment free speech protections do not protect speech that connects with one's responsibilities as a public employee. The case involved a prosecutor in the Los Angeles County District Attorney's office who did not receive a promotion after criticizing the issuance of a search warrant.

Supreme Court rulings on patronage also relate to First Amendment freedom of association issues. Based on these rights and Fourth Amendment due process guarantees, the Supreme Court ruled in *Elrod v. Burns* (1976) that firing on partisan political grounds violated First and Fourteenth Amendment rights. The case involved employees of the Cook County (IL) sheriff's

department who were fired or threatened with firing when a Democrat was elected and they could not prove party affiliation. A later decision, *Branti v. Finkel* (1980) reinforced the *Elrod* ruling. In this case, which concerned the public defender of Rockland County, NY, terminating staff attorneys for being Republicans, the court held that party affiliation must be job related to dismiss someone on patronage grounds. Finally, in *Rutan v. Republican Party of Illinois* (1990), the Supreme Court ruled that hiring decisions could not be based on partisan criteria, either, as this would harm employees' First Amendment rights of freedom of association. The governor of Illinois had used a hiring freeze as a way to control hiring and promotion decisions through the so-called patronage office. Notwithstanding these decisions, as noted above, patronage hiring processes continue, especially at the state and local levels. While more unusual, patronage scandals sometimes flare up in the federal government, such as when the Justice Department was accused of politicizing personnel practices in the Civil Rights Division during the George W. Bush administration.

More recently, the Supreme Court has considered collective bargaining issues in relation to First Amendment freedom of speech and freedom of association rights. In the case of *Harris v. Quinn* (2014), the court ruled that requiring personal assistants for the disabled who are not union members to pay "fair share" dues violated the First Amendment. The majority opinion stressed that previous precedents did not apply, since the workers in question were not directly public sector employees. Nevertheless, there is some speculation at this writing that the Supreme Court will extend this ruling more broadly in subsequent cases.

Public employees have Fourth Amendment rights that, for example, protect them from random drug tests. These rights, however, do not apply to positions related to law enforcement, public safety, or national security. In *National Treasury Employees v. von Raab* (1988), for example, the Supreme Court upheld drug testing for US Customs Service employees who carry guns or are involved in intercepting drugs.

## Civil Service Reform

The prototypical civil service system, with its traditions of neutral competence and protection from political influence, has been under scrutiny since at least the 1970s. Critics point to a hiring process that is too lengthy, does a poor job of making applicants aware of openings, and does not attract the best people. Further, methods for assessing qualifications focus on length of experience rather than substance. Some valid hiring procedures, such as general ability tests, are discouraged due to their adverse impact on minority applicants (US Merit Systems Protection Board 2006). In addition, there is a perception that poor performance is not punished, the incompetents are rarely fired, and the best performers are not rewarded.

More broadly, the system has been criticized for being unmanageable and unresponsive to politicians. Initiatives under the auspices of "reinventing government" or "new public management" have emphasized privatization, responsiveness to elected officials, deregulation of civil service rules, "at-will" employment, and improved customer service. Various reform efforts have tried to address these concerns, beginning with the Civil Service Reform Act of 1978.

In many ways, this law is a balancing act that tries to enhance responsiveness and improve management capacity, while protecting traditional civil service merits principles. As for its major components, it abolished the Civil Service Commission and split its functions between the Office of Personnel Management and the Merit Systems Protection Board. The former, which operates more directly under the president's control, formulates and carries out federal personnel policies. The latter remains more independent and tries to protect employees from having their rights as civil servants violated. The act also created a Senior Executive Service of top-level administrators who would forgo civil service protections in return for greater mobility across agencies and eligibility for higher pay. This idea originated with the Second Hoover Commission in the 1950s. In practice, however, most Senior Executive Service employees have usually remained in the same

agency where they have spent most of their career. The law also set up performance evaluation systems with performance-based pay. Finally, it established the right of federal employees to bargain collectively, a right that had previously only been granted through executive order.

While many of the provisions above, excluding the creation of the Merit Systems Protection Board, are designed to enhance flexibility and responsiveness, the Civil Service Reform Act also laid out nine principles of merit which appear below (Sylvia and Meyer 2002, 18–19):

1. Recruitment should be from qualified individuals from appropriate sources in an endeavor to achieve a workforce from all segments of society, and selection and advancement should be determined solely on the basis of relative ability, knowledge, and skills after fair and open competition that assures that all receive equal opportunity.
2. All employees and applicants for employment should receive fair and equitable treatment in all aspects of personnel management without regard to political affiliation, race, color, religion, national origin, sex, marital status, age, or handicapping condition and with proper regard for their privacy and constitutional rights.
3. Equal pay should be provided for all work of equal value, with appropriate consideration of both national and local rates paid by employers in the private sector, and appropriate incentives and recognition should be provided for excellence in performance.
4. All employees should maintain high standards of integrity, conduct, and concern for the public interest.
5. The federal workforce should be used efficiently and effectively.
6. Employees should be retained on the basis of adequacy of their performance; inadequate performance should be corrected, and employees should be separated who cannot or will not improve their performance to meet required standards.
7. Employees should be provided with effective education and training in cases in which education and training would result in better organization and individual performance.
8. Employees should be (a) protected against arbitrary action, personnel favoritism, or coercion for partisan political purposes and (b) prohibited from using their official authority or influence for the purpose of interfering with or affecting the result of an election or nomination for election.
9. Employees should be protected against reprisal for lawful disclosure of information which the employees reasonably evidences (a) a violation of any law, rule, or regulation or (b) mismanagement, a gross waste of funds, an abuse of authority, or a substantial and specific danger to public health or safety.

Further reform efforts occurred during the Clinton administration. Then Vice President Gore oversaw a "reinventing government" initiative under the auspices of the "National Performance Review (NPR)." This effort was designed to create a more effective, less rule-driven government that would also reduce costs by cutting employees, especially middle managers. One consequence of the NPR was toward a decentralization of public personnel functions to the individual agencies, away from the more centralized authority of the Office of Personnel Management. The NPR also created councils in most major agencies to foster labor-management cooperation in the workplace. These bodies were abolished during the George W. Bush administration, but resurrected in a slightly different form under President Obama.

The George W. Bush and Obama administrations continued to alter traditional civil service systems. President Bush, in particular, emphasized contracting out of government services. During his term, Congress passed legislation allowing the creation of a new mission-driven hiring system in the Department of Defense for civilian employees, as well as performance-based pay. Other legislation allowed agencies to discontinue the use of the "rule of three" and instead use category rating to assess employees, although many agencies did not adopt it initially. Under category rating, applicants that meet a certain

qualification standard may be interviewed, even if this results in more than three eligible candidates. In 2010, President Obama went further and abolished "the rule" of three in favor of category rating. He also developed policies requiring simpler and shorter job announcements and attempted to reduce the length of time for hiring.

At the state level, a few states, including Arizona, Florida, Georgia, Indiana, and Tennessee, have taken away many civil service protections from some of their employees, making it easier to dismiss them. In effect, many state workers under these systems became at-will employees. Pay increases and layoff decisions in some of these states have also become more tied to the performance evaluation process (Selden 2016).

## Conclusion

Since the Pendleton Act, the civil service has operated under a system that emphasizes merit principles and insulation from politics as a way to maximize government performance. Major laws enacted before the 1970s have generally reinforced this system while supplementing it with equity and employee rights in the realms of veterans' preference, affirmative action, and collective bargaining. Landmark court decisions have tried to balance government performance and employee rights. The trends toward reinventing government, new public management, and privatization of government services challenge the traditional civil service approach. Contracting out raises the specter of new forms of patronage, as elected officials can provide kickbacks in the form of government contracts to those who support their campaigns financially, and challenges the public service ethos (Kearney and Coggburn 2016).

# Civil Service Models in Latin America

Bastián González-Bustamante
Department of Public Administration and Policy, Universidad de Santiago de Chile, Santiago, Chile

## Synonyms

Civil service; Civil service systems; Public function

## Definition

Although there are several definitions for civil service models, one simple operational definition

describes them as systems of public employment management and human resources management (Echeberría 2006). There are also more complex conceptualizations which define them as a set of legal rules and instruments which enable the State to assure a staff of civil servants who are apt for the efficient functioning of its distinct levels of administration (Oszlak 2001). The Ibero-American Charter for the Public Service, signed by the Latin American governments in 2003, indicates that the civil service models must aim towards a professional administration and merit-based recruitment processes. Additionally, the Organization for Economic Co-operation and Development (OECD) highlights that the recruitment of civil servants must guarantee equal opportunities (OECD 2008). Despite the wide use of this concept, its dissemination and acceptance have been lesser in Latin America and it is frequently replaced by the concept of public function.

## Introduction

One of the main characteristics of Weber's bureaucratic model was selection by neutral competence, that is, the civil servants be selected according to norms of performance and merit, and not for personal characteristics or beliefs (Peters 1995). The fundamental value in the search for neutral competence was the capacity to professionalize government management and public administration (Kaufman 1956). This professionalization is relevant since it determines the capacity of public organisms, which affects the processes of formulation and implementation of public policies (Farazmand 1997).

Nevertheless, merit in the public sector is something complex to define, since personal characteristics or beliefs can positively influence government efficiency (Peters 1995). In fact, political appointees and spoil systems have advantages like the development of a committed bureaucracy. The controversy between merit-based recruitment and the political appointee is associated with the politics-administration dichotomy. This dichotomy refers to the traditional idea that proposes separating the political sphere from the administrative within government (Wilson 1887). According to Peters (1995), this controversy is a question of degree, since all political systems make political appointments at a certain level and additionally have posts which are filled in a routine manner according to some type of merit system.

Even though currently, the politics-administration dichotomy tends to be considered a simplistic vision of public administration and bureaucracy (Frederickson et al. 2012), the tension between merit and partisanship in the appointment of civil servants remains as an academic debate and the discussion continues in different spheres (Olavarría-Gambi and Dockendorff 2016). The defenders of professionalization conceive of the systems of selection and recruitment based on merit as a public good which permits the prevention of the political use of the administration. On the other hand, the counter-argument affirms that professionalization can produce an autonomy that is damaging for democratic representativeness (Farazmand 1989, 1997; Olavarría-Gambi and Dockendorff 2016; Rockman 1996).

This entry examines the concept of public service models with special emphasis on the Latin American reality. The following section deals with the subject from an historical perspective, its ties to the patronage systems, and the main milestones which have shaped the evolution of the civil services. Subsequently, the next section deals with the chief characteristics and changes in the civil services and presents an evaluation of the models in Latin America. Finally, the last section sets out some brief conclusions and summarizes the main ideas of this text.

## The Civil Service Models from an Historical Perspective

According to Raadschelders and Rutgers (1996), it is possible to identify different stages in the historical development of the civil service models. First, during feudalism and the late Middle Ages, it is possible to identify civil servants subordinate to a specific ruler. Later, during the seventeenth

and eighteenth centuries, civil servants are employed by the State, a situation which permitted the differentiation of the public sphere from the private. After that, during the nineteenth century, civil servants were considered as agents that were not only in the service of the State, but at this point, the administration tended to be independent of political power and the politics-administration dichotomy emerges. Lastly, in the twentieth century, professional civil service models consolidate with the aim of providing adequate public goods and services.

From another perspective, following Grindle (2012), the emergence of the civil service models can be associated with patronage systems and clientelism which date back to the eighteenth century. These systems emerged from an institutional architecture where academic credentials were of great relevance for obtaining positions of privilege in the State apparatus. This benefited the political and social elites of the period. In Great Britain and France, for example, clientelism worked as a mechanism to guarantee the access of the elite to public employment and to ensure their well-being. In Japan and Prussia, on the other hand, clientelism and civil service models were an instrument for the construction and consolidation of authoritarian States.

In Latin America, patronage systems and clientelism dating back to the nineteenth and twentieth centuries are also to be found (Grindle 2012). During the nineteenth century, the independence movements eradicated a sizable part of the Spanish and Portuguese colonial heritage; however, the patronage systems and clientelism remained intact as elements peculiar to Latin American politics. Due to the aforementioned, public employment did not adjust to meritocratic logic; rather, it was reserved for certain social groups and it was used as an element to negotiate political loyalties (Grindle 2012; Nef 2003). The consolidation of the Latin American civil service models has historically been tied to critical junctures, i.e., corruption scandals, political or economic crises, among others. Notwithstanding this, the different reforms promoted have not managed to eliminate the latent patronage systems and clientelism (Grindle 2012).

During the twentieth century, the civil service models gradually consolidated, especially in the United States, Europe, and Japan. This involved putting to one side the spoil systems and patronage. Also public services began to align their services with the user-satisfaction. This tendency became consolidated with the emergence of New Public Management (Grindle 2012). This concept is associated with a set of administrative doctrines and neo-managerial reforms which dominated the agenda of several OECD countries from the late 1970s. The central premise to these doctrines can be summed up as directing State organizations as if they were private enterprises and that public directors must have high levels of discretion in order to make efficient use of available resources (Christensen and Lægreid 2011; Hood 1991; Llano 2015).

This was complemented by the World Bank's first-generation reforms, which promoted the deregulation of markets, privatization of public companies, outsourcing of services, reduction of public spending, as well as an important reduction in the size of civil services (Oszlak 2001). These neoconservative reforms are associated with the rise in neoliberal politics in Latin America from the time of the Washington Consensus. The package of neoconservative and neomanagerial reforms was considered a fundamental piece for the progress of democracies in development (Llano 2015; Pollitt and Bouckaert 2002). This produced what Olsen (2006) called modernization by imitation.

Subsequently the second-generation reforms were implemented with the extended Washington Consensus. These reforms were less neoconservative, e.g., prudent openness to capital, the fight against corruption, focused poverty-reduction policies, and the creation of social security networks. This boosted a revindication by the public sector through an institutional strengthening to generate regulation capacities and the creation of anticorruption organisms (Santiso 2001).

In this context, the need to reduce political appointments became relevant. Also, the existence of a group of senior civil servants separated from the political sphere and that of the classical

bureaucracy became a fundamental value for the reforms of the Latin American civil service models (Ramos and Scrollini 2013). This, added to the growing need to rely on professional models of public services, was reflected in the Santa Cruz Consensus of June 2003 within the framework of the Fifth Ibero-American Conference of Ministers of Public Administration and State Reform. In this instance, the Latin American governments signed the Ibero-American Charter for Public Service, which defines the fundamentals for a professional public service and assigns orienting principles for its creation.

## Characteristics and Changes of Civil Service Models

The Ibero-American Charter for the Public Service indicates that there is a positive correlation between the professionalization of a civil service and the levels of confidence of citizens in the public administration, government efficiency, levels of transparency, and the capacity to generate economic growth. A professionalized civil service model has a positive impact on economic and democratic development and on overcoming poverty (Evans and Rauch 1999; Henderson et al. 2007; Lafuente et al. 2013). The civil service is relevant for State capacity since it generates incentives and restrictions for the action of public organisms in a transversal way (Barzelay 2001). Moreover, it represents an important State investment, since on average salary costs in central administration of the Latin American countries represents 5.6% of the GDP and 27% of total public spending (Cortázar et al. 2014a).

A civil service model can be classified according to its degrees of openness and the tension between its level of politicization and professionalization (Ballart and Ramió 2000; González-Bustamante et al. 2016; Ramió and Salvador 2005). The degrees of openness determine whether the model is open or closed. An open model is founded on the selection of civil servants based on their technical specialization. In contrast, a closed model favors life-long tenure, which implies that civil servants must be versatile and adapt to the different needs of the organization throughout their career. It is possible to find mixed models which mix specialization and versatility.

The relation between politicization and professionalization, on the other hand, takes account of the tension between the prioritization of professional merits and political confidence. All the civil service models possess political appointees and career officials, appointed in a routine manner according to some system of merit. What do vary are the limits; that is, until what hierarchical level are appointments based on merit, and where do political appointments begin? (Peters 1995). In general, political appointees are usually designated for shorter periods than career officials (Lewis 2008; Resh 2015). The traditional civil service models have a limited capacity to produce senior civil servants, which is why professionalization fostered a differentiation between the managerial function and the ordinary civil service. This is how senior civil services emerged. In some countries, the managerial function is differentiated, e.g., Belgium, Canada, Chile, the United States, Holland, Italy, New Zealand, the United Kingdom, Sweden. In other cases, the civil servant career and the managerial level are not separated, e.g., Germany, Austria, Colombia, Spain, France, Japan, Mexico (Longo 2003; Martínez Puón 2012).

In the models with high levels of politicization, there is a sensation of violation of the acceptable limits of the balance between political nominations and merit-based appointments (Peters and Pierre 2004). They can even become similar to the American spoil system of the nineteenth century (Ramió and Salvador 2005). Nevertheless, although politicization does have a generally negative connotation, it also has potentially positive aspects since it can generate a more committed bureaucracy which invigorates the public service, something which is not possible with a neutral bureaucracy (Peters and Pierre 2004). The politicized models can be open-circuit or closed (Quermonne 1995). The open-circuit model implies a selection of civil servants based on political confidence subsidized by professional criteria. The closed circuit, in contrast, implies

direct nominations that give preference to political confidence with the presence of some professional merits.

The reforms of the Latin American civil service models have been conditioned by the process of modernization of public management and the fight against corruption (Barzelay 2003; Lafuente et al. 2013). There are several cases in which there is no specific model, whereas in others there are highly professionalized services, particularly in the diplomatic area (Ramió and Salvador 2005). On the other hand, countries such as Bolivia and Mexico have tried to implement civil services in some since the 1990s. There are also cases such as Chile, which historically had a model of civil service which was dismantled by the military dictatorship and in the past decade has fostered changes and revisions of its institutionalism (González-Bustamante et al. 2016).

Over the past decades, there has been a noticeable tension stemming from the institutional strength or weakness of the different civil service models in Latin America. On the one hand, there are countries whose institutional frameworks permit the prediction of a positive evolution of their civil service models. However, other cases present problems with respect to the political capacity to reach agreements and drive reforms (Echeberría 2006). In this context, diverse civil service models have been created or have been completely reformed since 1990, e.g., Argentina, Bolivia, Colombia, Ecuador, Mexico, Nicaragua, Panama, Paraguay, Peru, the Dominican Republic, and Venezuela. Others have undergone significant reforms over the past decade, e.g., Brazil, Chile, and Uruguay.

## Evaluation of the Civil Service Models in Latin America

Although the degrees of openness and the tension between politicization and professionalization are relevant, they are not the only elements for classifying a civil service model. According to Longo (2001), it is possible to distinguish at least four key elements: (a) systems of access to employment, (b) organization of the career, (c) the recognition of rights of civil servants, and (d) administration of the system. For example, with respect to the systems of access particularly, at least three classical models can be distinguished: (a) the French model, which emphasizes tenders and civil servant schools; (b) the German model, focused on the process of extended learning in different stages among which there is a preparatory stage and different exams which enable the exercise of public functions; and (c) the British model, with an emphasis on the professionalization and independence of the organisms in charge of the system.

An effective way of evaluating the changes in the Latin American civil service models is to use the methodology of the del Inter-American Development Bank (IDB), which is based on the Ibero-American Charter for Public Service to measure critical points and evaluate civil services. The first diagnostic evaluation or baseline was carried out in 2004 and 93 critical points were identified, associated with different indicators. In 2010 critical points were reduced to 33 to ensure comparability and a second measurement was taken between 2012 and 2015. The methodology evaluates the civil service models in eight subsystems: (a) human resources planning, (b) work organization, (c) employment management, (d) performance management, (e) compensation management, (f) development management, (g) human and social relations management, and (h) human resources function organization. This permits the calculation of five composite indexes: (a) efficiency, (b) merit, (c) structural consistency, (d) functional capacity, and (e) integrating capacity. The details of this methodology can be reviewed in Longo and Iacoviello (2010), Iacoviello and Strazza (2014), and OECD (2016).

The merit index serves precisely to evaluate the degree of politicization of the civil service models, since their critical points are: (a) recruitment for the filling of posts open to all candidates that fulfill the required criteria based on technical requirements; (b) the existence of mechanism and procedures to prevent arbitrariness in the selection; and (c) dismissal of technical personal not motivated by political changes. The regional average in 2004 was 33 points on a scale

**Civil Service Models in Latin America, Fig. 1** Own elaboration with IDB data updated to June 2017, scale from 0 to 100

of 100, which rose to 45 in the 2012–2015 measurement. The countries with a weak merit-based recruitment process are Bolivia, Honduras, Guatemala, and Panama. The most dramatic fall in the last decade was in Bolivia. In contrast, countries with a high indicator are Brazil, Uruguay, and Costa Rica (see Fig. 1).

The five indexes showed an increase from 2004; however, the most important advance is reflected precisely in the merit index, followed by structural consistency (Longo and Echebarría 2014). Furthermore, with the evaluation of the civil service models of 16 Latin American countries by IDB, it is also possible to calculate the Civil Service Development Index (CSDI) as an aggregate indicator for most countries in the region. The regional average of CSDI for 2012–2015 reaches 40 points on a scale of 100, which implies a rise of 10 points in the past decade. Bolivia, Honduras, and Guatemala are the countries with the lowest indexes. The deterioration of the Bolivian civil service model is relevant and occurred specifically because, as from 2006, the government decided to prioritize direct appointments without tenders in order to favor historically marginalized sectors (Iacoviello and Strazza 2014). Nevertheless, there are cases that have improved substantially over the last decade, with Peru, Ecuador, and El Salvador standing out here, registering an increase of more than 20 points. El Salvador, for example, managed this important increase thanks to the creation of a unit of coordination and gradual implementation of tenders, whereas in Ecuador the drive was associated chiefly with the creation of the Public Service Vice-Ministry (*Viceministerio del Servicio Público*) (Iacoviello and Strazza 2014). The countries with the highest indexes are Chile, Brazil, and Costa Rica (see Fig. 2). Brazil and Chile particularly are the most consolidated countries in the region. Whereas Chile shows greater development due to expansion and consolidation of its System of High-Level Public Management (*Sistema de Alta Dirección Pública*) (González-

**Civil Service Models in Latin America, Fig. 2** Own elaboration with IDB data updated to June 2017, scale from 0 to 100

Bustamante et al. 2016), Brazil displays less dynamism despite the fact that in the past decade it consolidated a general performance evaluation system (Iacoviello and Strazza 2014).

In summary, the professionalization of the Latin American civil service models presents range of nuances. One important group of countries, as Iacoviello and Strazza (2014) point out, has achieved several improvements after setting out from a low baseline in 2004. Another group of countries, which set out from a medium to medium-high baseline, shows relative stagnation. Finally, only Chile shows significant advances in different dimensions, having departed from a high baseline. Furthermore, certain gaps can be perceived between merit and the CSDI. The most relevant negative gap is presented by Bolivia, which has a very low level of merit in comparison with the development of its civil service model, which suggests that there are other indicators that elevate its development, e.g., efficiency, structural consistency, functional capacity, and integrating capacity. Then there is the Brazilian case, which works in the opposite way. The merit in its model is very elevated for its level of development, which is, at any rate, one of the most consolidated in the region. There are cases where a balance is observed, such as Chile, Mexico, and El Salvador.

In general, the advances and setbacks in the development of the civil service models in Latin America are tied to the dynamics in the processes of reform and the national agendas for modernization. According to Cortázar et al. (2014b), in the last decade, it is possible to identify three types of reforms associated with the civil service which have different types of results in the region: (a) the professionalization of management level, e.g., Chile, Peru, and Uruguay; (b) the development of guarantees against politicization, e.g., Paraguay and the Dominican Republic; and (c) compensation management, e.g., Costa Rica, Honduras, and Paraguay.

## Conclusion

The civil service models are systems of management of public employment and recruitment of civil servants. In recruitment, there is a tension between merit and political confidence. The opposition between merit-based recruitment and the political appointees is associated with the classical politics-administration dichotomy. This dichotomy implies separating the political and the administrative spheres in government. Defenders of merit and professionalization point out that these prevent the political use of the public administration; however, extreme professionalization can generate a bureaucratic autonomy which puts democratic representativeness at risk. A civil service model can be classified according to different elements, one of the most relevant of these being its degrees of openness and tension between politicization and professionalization.

In Latin America, the patronage systems and clientelism of the nineteenth and twentieth centuries limited the evolution of civil service models. Subsequently, in the second half of the twentieth century, the New Public Management and the neoconservative reforms conditioned the modernization of the public sector and of the civil service models. At the end of the twentieth century, the second-generation reforms of the World Bank boosted a reinvention of the public sector in order to generate capacities for regulation and the fight against corruption. In this context, the idea of having a body of senior civil servants separated from the political and bureaucratic spheres became relevant. Also, the need to rely on professional civil services grew.

That growing need in Latin America was crystallized with the Ibero-American Charter for Public Service in 2003. Following the fundamentals of this charter, the IDB designed a methodology which allowed one to evaluate the models via different subsystems and to obtain an aggregate index of development with which changes over time can be analyzed. Thanks to this, one can observe that the professionalization of the Latin American civil services has different nuances. There is a first group of countries which in the past decade had civil service models with a low level of development and achieved partial improvements. In this group, some isolated cases attained significant improvements. Then, there is a second group of countries whose models had a medium-high development and presented a relative stagnation in recent years. Finally, only Chile and Brazil have a highly developed model, and in the past 10 years only Chile has shown significant advances.

# Civil Service Reform and Ethics

Christoph Demmke
Public Management, University of Vaasa, Vaasa, Finland

## Synonyms

Civil services; Ethics; HR reforms; Public administration reform

## Definition

Evaluation of how morality and ethics are represented in the discourse about the reform of

human resource management and in the context of new governance reforms

## Introduction

Public administration and public HR policies are constituent parts of the system of government. As history shows, countries may survive without government but not without public administration. Until today, no government has completely privatized the delivery of public tasks, no public administration works like a private company, and no public HR systems have been totally aligned to private sector practices.

Despite its many specific features and importance for millions of people, the nature of public administrations and HR policies are not well known to the wider public. Moreover, public administration and HR policies as such rarely enjoy a high reputation. At best, public administration reform is an interesting subject for experts. Civil service reforms are mostly dealt with by lawyers, HR specialists, and civil servants themselves. It is often seen as managerialist and technocratic. This is strange, as public administration and civil services should serve the public interest and citizenry, and therefore, public administration reform should be of great interest to the wider public. Moreover, the very idea of civil service and HR reform raises ethical considerations (Greenwood 2013; Budd and Scoville 2005). HR managers change, shape, direct, and alter employee's lives. Managers make hiring decisions; assess competences, skills, and performance; decide on training needs, rewards, sanctions, promotions, telework opportunity, diversity issues, dismissals, and private-work balance; provide feedback; etc. All of these tasks have important ethical consequences for individuals.

At the same time, people have high expectations and request that the delivery of public tasks follows *ambitious* objectives and ethical imperatives. They want employment systems that guarantee observation of the fundamental values and administrative law principles and ensure a focus on effectiveness, efficiency, and accountability. Government policies should also ensure equal treatment and fairness and be attractive and competitive with respect to the private sector policies while managing tax payers' money as prudently and while also rewarding individual performance. Increasingly, employment structures should also be diversified and representative while ensuring the merit principle, the equality of chances, and the principle of nondiscrimination (which is being defined much broader than decades ago).

Thus, people want high-performing public administrations that deliver public value in an ethical context. Still, ethics and integrity policies will never achieve a state of perfect integrity. Values as such are ambivalent and conflict with each other, and public employees are faced with many dilemmas. Past experience also shows that public management reforms always produce paradoxical and unintentional reform effects and operate in a context of changing values and value conflicts. Therefore, in most cases, ethics policies can only fill the gaps that other policies and system logics produce. On the other hand, ethics should not be a "plug-in policy" that fills the gaps that other policies and other governance logics produce. It is also time to acknowledge that ethics is not only an abstract and soft-issue. Instead, it is a practical, daily-life issue that is everywhere. However, neither a "bit of integrity" should be an objective. On the other hand, requiring a state of full integrity is also unrealistic (apart from the question how to define what is full integrity).

## Definition of Governance and Ethics

Governance has become a popular if not trendy concept in the discussions about the changing nature of the state, its role, functions, and capacities. It can also be used as a normative concept which prescribes the way in which the state performs. On the other hand, governance can be defined as a theory of change from government to governance. According to Peters and Pierre (2016, p. vii), Governance is the most commonly utilized term in political science and used in a variety of different and even contradictory ways. Overall, governance is a descriptive-analytical

concept which characterizes the way in which a state, government, or other public actors decide, regulate, manage, administer, and/or exercise responsibilities and powers. Whereas most observers interpret developments as a shift in the locus of political power from government to networks and other forms of exchange between the state and society, others believe that the state remains very much at the center of governance. Because of its conceptual vagueness, governance research in all its forms is highly complex and fragmented, bridging the different scientific disciplines and within the political sciences.

Theories of ethics refer to what is right or wrong, good or bad. Often, the terms ethics and moral are commonly used as interchangeable synonyms. Others, however, define moral as referring to the principles of right and wrong and ethics as the study of those principles (Huberts 2014, p. 5).

## The Traditional Link Between Government, Personnel Administration, and Ethics

For a long time, personnel administration happened in some form or another. HRM functions such as of hiring, training, compensation, and discipline/ termination were not performed by HR specialists or HR departments. In fact, traditional HRM was rather HR administration and a technical duty within organizations. HR administration was subordinated to the emergence of the doctrine and practice of scientific management (SM). The first professional/scientific writings on business organization and management appeared in the early 1880s in the United States, authored primarily by engineers. The engineers sought to use principles of science to increase the efficiency of business production systems. Inevitably they were led to consider the "people" side of production, including methods of employee selection, job assignment, supervision, work pace, and compensation. This new approach found its most influential and strategic formulation in the writings of Frederick Taylor, particularly his book *Principles of Scientific Management (1911)*. Personnel administration was about recruiting people, paying people, and sanctioning, controlling, and dismissing people.

Thus, personnel administration was about extrinsic motivators. Ethics did not play a role for both sides, employers and employees.

However, gradually, the notion and (ethical) importance of HR administration changed with the birth of HRM (the Hawthorne Experiments) and – later – the further elaboration of motivation theories and the birth of performance management. From now on, HRM grew in complexity.

Before we will come back on this, we need to consider what has changed and how this relates to ethics.

For a long time, it was relatively easy to define the ethical link between government and the people who served government, the civil servants. In all countries the civil service status was linked to the state as a sovereign power and the rule of law doctrine as well as to the principle of legality. The question who should be given a civil service status was always linked to the task of exercising national public powers, safeguarding the general interest of the state and a traditional nation-state philosophy. This important link between civil service and nation-state can best be observed in the public law status which originates in France aiming to establish and guarantee a democratic state based on the principles of the French Revolution. In Germany, the introduction of the public law status was inspired by philosopher Friedrich Hegel in his *Elements of the Philosophy of Right.* Hegel's idea of the civil servant and the state as such was conceptualized as a Leviathan (Thomas Hobbes) which stood above the national society and citizens. Its main role was to protect the society by enforcing regulations to achieve fairness and to balance the diverging egoistic interests within the society.

In fact, in Europe the emergence of independent and impartial civil services is also closely linked to the emergence of the Republican State (firstly in France) and the nation-state (especially after the Congress in Vienna in 1815). This strong traditional link between the civil service and the (republican) nation-state has endured in many countries until today. In France, the public law status was "invented" during the French Revolution in order

to link the civil servants to the State and not to the Monarchy or other individual interests. Therefore, Bekke and van der Meer (2001) defines modern civil service systems as depersonalized systems which differ from traditional modes of government. However, the realization of an independent, impartial, and merit-based civil service was more difficult than expected. "Indeed, for much of the nineteenth century (. . .) the spoils system dominated personnel policy. (. . .) Public office was perverted into a private fiefdom as arrogance, greed, and opportunism prevailed over honor, openness and prudence. Favoritism, cronyism, intimidation, corruption, waste, scandals and rampant dismissals were widespread in that squalid era. Rather than governance; its highest priority was to reward its friends, to grant favors for favors given" (Bowman and West 2008, p. 183).

In the nineteenth century, the biggest changes included the introduction of centralized recruitment procedures, the adoption of civil service laws, the centralization of HR policies, and the introduction of merit principles (including entrance examinations, job tenure, career service, political neutrality) which were adopted – as a moral guardian to democracy – and which should shield employees from politically inspired employment actions. "Instrumental in effectuating these changes was the establishment of the Rechtsstaat or in Anglo-Saxon terms the rule of law (. . .). This powerful idea had implications for the relation between government and the civil service system. (. . .) Step by step the legal position of civil servants in all countries was formalised and standardised (. . .). Merit instead of privilege was becoming the guiding principle" (Bekke and van der Meer 2001, p. 278). The status of the civil servants evolved into a protected status with many specific employment features that differed to ordinary employment patterns. Contrary to this, the purpose of creating a modern civil service was a response to the emergence of the liberal state which was based on the rule of law. Consequently, almost all Member States designed their public organizations in specific ways because they expected a certain behavior on the part of civil servants would result from specific organizational features.

In the twentieth century, countries introduced hierarchical and formalized organizational structures, scientific management methods (according to Taylor and Fayol), clear and rigid career paths, lifetime tenure, full-time employment, seniority, advantageous pension systems, and rigid remuneration systems in order to reduce as far as possible the risk of too much political influence, corruption, misconduct, the exercise of private interests, and instability of government. Until today, the essence of administrative behavior is to follow hierarchical principles and doctrines which are based on the rule of law. Following this, at a minimal level, administration is considered to be good and ethical if it achieves the implementation and enforcement of the existing laws and policy goals of the government of the day. Moreover, ethically good or acceptable behavior is also still defined in terms of rationality, law obedience, impartiality, and standardization. From the ethical point of view, following law or superior's orders is usually not problematic. It is still a very relevant guideline for public officials, as it highlights the importance of the rule of law and loyalty to democratically elected government.

Dicey expressed the meaning in this way: "when we speak of the 'rule of law' as a characteristic of our country, not only that with us no man is above the law, but (which is a different thing) that, every man, whatever his rank or condition, is subject to the ordinary law of the realm and amendable to the jurisdiction of the ordinary tribunals. Thus no one is above the law, and all are subject to the same law administered in the same courts" (Bingham 2011, p. 4). This principle was translated into concrete HR policies.

When looking back, the traditional argument for a specific organizational structure and specific HR policies were to produce a certain ethical status for civil servants who should be committed to the public good, neutrality, and impartiality and to observing confidentiality and displaying expertise. In many countries, therefore, civil servants were working in hierarchical organizations and had very specific recruitment procedures, specific ethical obligations, little mobility, varying working conditions, and specific social security systems. Many experts were convinced that these

specific organizational structures and employment conditions "produce" a certain public service ethos, individual performance, and "public service motivation" for civil servants who – in exchange – are committed to the public good, neutrality, and impartiality and to observing confidentiality and displaying expertise.

Until today, this traditional rational, technical, and instrumental understanding of Fordism, Taylorism, and bureaucracy and of "organizations" and of "people" have not completely vanished. With central public administrations still being closed off and separated from society and citizens, central public employees are still a relatively protected category of staff. Because of their still existing specific treatment, civil servants are supposed to have a specific public service motivation (PSM), having different values and different personalities, being motivated by different incentives, working differently than employees in the private sector, being more security-minded, performing differently, and being more rule-oriented and more oriented to the common good.

## Why Countries Started to Deviate from the Traditional Government Models

In all countries, civil service concepts were designed with the objective to make the public sector independent from the private sector and civil servants independent from personal interests. For these tasks and duties, many countries were reluctant to outsource or to privatize core governmental tasks and to completely reverse established specific employment features and HR policies that were founded in the nineteenth century in order to protect the democratic and liberal state. In most cases civil services were designed as rational machines which had a democratic and ethical function and which should serve the society and the law, protect the population, and act in not discriminatory ways as well as function in a sustainable manner. When looking back, this traditional technical, legalistic, and bureaucratic compliance and *ethics of neutrality* (Thompson 1985) approach have dominated within government until at least the 1970s.

However, increasingly, almost all countries started to deviate from the classical bureaucratic model and introduced changes which led to a new diversity of administrative systems. Today, de-bureaucratization trends continue, but there is no common trend toward an alternative universal administrative model. Rather, current reform modes are caught in an identity crisis. Countries know well what they want to leave behind. But they do not know where to go. Consequently, there is also no trend toward a best-practice model.

Therefore, there is only broad acceptance that the times of bureaucratic career models are over because these concepts underperformed on several fronts:

- Bureaucratic structures were built on the assumption that public management differs to private sector management, and public values should be safeguarded against private sector values. In fact, de Graaf and van de Wal show that that "the values of profitability, competitiveness, and customer orientation have a greater influence on business decisions; in public organisations, values such as legitimacy, lawfulness, accountability, and impartiality play a larger role. However, great differences exist among the organisations within each sector" (de Graaf and van der Wal 2008, p. 79). However, values overlap in public and private sector organizations. Thus, empirical research shows that public and private value patterns cannot be clearly distinguished, and many organizational values appear to be shared among government and business managers. Thus, similarities exceed differences. Still, it must be examined whether a correlation exists between certain sector-specific values intermixing between both sectors and certain specific moral and functional problems, especially in semipublic and hybrid organizations (Van der Wal et al. 2007). Hence, artificial distinctions between public and private values are not needed anymore in times of "blurring of boundaries between the public and private sector." For example, "common core" values are accountability, expertise, reliability, efficiency, and effectiveness, all of which are considered

crucial in both public and private sector organizations. Additional analysis seems to suggest that value preferences are primarily attached to sector rather than to age, gender, working experience, or previous employment in the other sector.

- The concept of bureaucracy was built under the premise that the political, administrative, and public spheres should be separated. Today, a blurring of boundaries takes place between international politics and national politics, private and public tasks, civil services and private sector employment, work and private life, and rationality and irrationality and between many other spheres which were supposed to be separated. This blurring of boundaries is quite ironic as many traditional tasks and duties of the national civil services are not changing. However, these trends make it more difficult to legitimate an elitist civil service, which enjoy different employment and working conditions than other employees.
- Traditional bureaucratic (HR) administration is under attack particularly because of its long time focus on bureaucratic, standardized approaches and technical HR issues such as recruitment, selection, payroll, benefits, employee relations, performance management, industrial relations, and legal issues and its limited role in achieving business objectives. Today, its core claims and professional self-image have become entwined with behavioral, psychological, ethical, financial, budgetary, and managerial narratives (Thompson 2011, p. 363). Overall, organizational structures, the acceptance of rationality as a principle, the understanding of role and importance of HRM, and motivation and leadership theories have enormously developed since the publication of the Hawthorne Experiments and – later – developments in the neurosciences.
- Another problem with the concept of bureaucracy and civil service is, because as an ethical guideline, it is simply too narrow for today's multilevel governance. Especially the importance of individuals was neglected because of the focus on the concept of "administrative neutrality" and the dominance of rational and legal approaches. Insights from behavioral economy and motivation theory have indeed shown that work in the public sector is more value-laden and more unpredictable than ever. On the other hand, allowing new behavioral insights and organizational psychology to play a more important role in civil service systems may also open the box to very uncertain future developments. For example, whereas traditional writers such as Wilson, Weber, and Taylor believed that rationality should be the guiding principle of any civil service system, today, the term bounded rationality (Simon) has become a buzz word, and new behavioral insights and behavioral instruments such as *nudging* have become a new fashion. Overall, civil service and HR reforms are increasingly influenced by the "psychologication of HRM." We will come back to this.
- Next, role and importance of fairness perceptions and the importance of individual recognition and emotions at the workplace were never recognized in the traditional public sector. In the meantime, theories of diversity, recognition, engagement, and organizational justice are central in explaining counterproductive work behavior. New evidence suggests that there is differential relationship between different types of justice (perceptions) and counterproductive work behavior. Moreover, emotions are a bridge between justice perceptions and behavioral responses (Moliner et al. 2017). Overall, justice perceptions depend on personal traits such as attitudes, status, expertise, experience, and leadership style.
- Elsewhere, change is also explained by dysfunctions of the classical bureaucratic model which is/was too costly, discriminatory, too rigid, too hierarchical, not innovative, not performing well enough, and causing demotivating effects. Often, it is claimed that new organizational models are needed (whatever type of models these are) to render public services superior, more flexible, innovative, effective, efficient, and outcome oriented. Increasingly, evidence from organizational science demonstrates that bureaucratic and hierarchical structures do not perform better

than other organizational types (as suggested by Max Weber 100 years ago).

- Until today, there is no evidence that bureaucratic structures produce the intended results. Evidence is growing that specific public working conditions and bureaucratic structures do not necessarily produce less corruption and a specific public service ethos. Dahlström and Lapuente (2018) examine the existing link between bureaucratic structures and corruption. Both authors also conclude that closed bureaucracies are negatively related to the quality of governance. In "The Merit of Meritocratization: Politics, Bureaucracy, and the Institutional Deterrents of Corruption," Dahlström et al. (2012; see also Rauch and Evans 2000) concluded that only some bureaucratic factors (most notably the meritocratic recruitment of public employees) exert a significant influence on curbing corruption even when controlling for the impact of most standard political variables. In her study on *The Quest for Good Governance: How Societies Develop Control of Corruption* Mungiu-Pippidi (2016, p. 21, 29) concludes that countries with a higher power-distance culture have higher levels of corruption. On the other hand, one explanatory variable for high levels of corruption is also the blurring of boundaries between the public and the private sector. The latter also applies to those more private sector like countries with an open access order (Mungiu-Pippidi distinguishes between governance regimes with a limited access order and an open access order and believes that the latter countries have a sharper separation between the public and the private sector, p. 29.). Meyer-Sahling and Mikkelsen (2016) and Kopecky et al. (2016) examine patronage and politicization trends in Central and Eastern Europe and on the western Balkan. However, also in Western Europe, politicization is rising – again.

Still, government and traditional bureaucratic features are not disappearing. Contrary to this, in some cases, trends seem to be toward the revival of the "Leviathan" concepts and flexible ways of governance that combine forms of hierarchical steering and participative modes of steering. Thus, the current paradox is that, despite all changes that are leading to the "blurring of the state" and ever new statements and conclusions about the emergence of ever new governance-like and networking-type structures, "Government" still exists, and the state is not powerless. Also, state capitalism does not disappear. In public policies, classical public tasks such as "security," "education," and "skill development" have become top issues on the political agenda. Also, the reactions to the financial crash in 2008 and numerous bails out policies, the hierarchical management of the Greek financial crisis, and the management of the refugee crisis and state responses to numerous terrorist attacks and (supposed) security threats everywhere in the world have demonstrated that "Leviathan" is not dead. Although the boundaries between the civil services and the societies are further eroding, the strong state has even reappeared in many public policies, for example, in the fight against terrorism, cybercrime, security issues, data protection, etc.

As understandable some of these trends are, they also illustrate the ongoing need to protect the rule of law, privacy, individual freedom, the need to Government and offer protection for citizens against arbitrary state and administrative decisions.

These trends lead us to the following questions: If some traditional features of the traditional state, public administration, and civil services are re-emerging but other classical features are slowly disappearing, how will the new civil services look like? What is the impact on the abovementioned changes on the principle of democracy, merit, and rule of law and the importance of values as such? Do we live a revival of a traditional pre-modern "Leviathan-like civil service conception" combined with a postmodern digitalized and individualized work system?

## The Nature of Change and the Implications for the National Civil Services

According to neo-institutional theories, the political and institutional world is currently moving away from universal or even best-practice institutional configurations toward more specific best-fit context-related models. New developments lean

more toward the testing of new organizational models and work systems that fit into the national, regional, local, or even organizational and leader-follower context. Best-fit schools are associated with this contingency approach and argue that organizations must adapt their strategies and implement reforms to the specific local strategy and to its environment.

Also, in the field of institutionalization ethics management, the effectiveness of any particular ethics infrastructure system is determined by the degree of consistency among its constituent elements and the way they fit into the organization, HR policies, culture, and leadership styles.

According to Huberts (2014), it is only possible to stress the "basics of an integrity system" (Huberts 2014, p. 190) because working conditions, leadership styles, and work organizations continue to differ, ranging from traditional Taylorism models to high-involvement or high-job autonomy models with low hierarchies and high levels of job autonomy. Also, the role of employee management varies from very paternalistic to very communicative and partnership-oriented forms (of social dialogue). Consequently, there is no bureaucratic one-size-fits-all organizational model anymore: Instead, trends are toward multiple forms of organizational structures, ranging from traditional and bureaucratic working systems to innovative workplaces and learning organizations within different governmental organizations and even within the same organizations.

In fact, there can have been few times when it has been a greater challenge to understand the changing nature of the national public administrations and the impact on ethics and workplace behavior – worldwide. Classical typologies like career systems, position systems, or closed bureaucracies belong to the past. Overall, public employment is changing about the size, structure, composition, and status. The national central public administrations are becoming more flexible, diverse, feminine, fragmented, and smaller. All countries are eager to enhance efficiency, productivity, and innovation by cutting budgets although there is no best-practice blueprint how to do this without the loss of other values and the emergence of new value conflicts. Today, most experts believe that trends in organizational reform are toward a move to non-Taylorism learning work organization and agree upon the proposition that new forms of HR strategies and HR practices are associated with superior performance (Eurofound 2009). Increasingly, the design of work systems is linked to organizational learning, innovation, and organizational performance. Still, one of the main challenges in the field of organizational theory and HRM is to develop and measure worldwide aggregate measures that can be used to measure the relation between (the change of) work systems, HRM, organizational learning, organizational performance, and workplace behavior. So far, empirical work on these links has been carried out mostly by the European Foundation for the Improvement of Living and Working Conditions (Eurofound 2009). Basically, Eurofound has concluded that where work is organized to support high levels of discretion, team working, learning levels, and job complexity, in solving complex problems, organizations tend to be better performing and more active in terms of innovation (Eurofound 2009). This again has positive effects on workplace behavior. However, the link between more job autonomy and politicization is less clear.

All current reform trends take place in a context – to use the concept used by Robert Merton – in which purposive action does not imply "rationality" of human action (Merton 1936). This implies that, increasingly, it is accepted that the most important limitation to a correct anticipation of consequences of action is provided by the existing state of limited knowledge in the context of increasing criticism toward classical rational choice theories. Because of this, behavioral economics have grown in importance and have increasingly informed politics, both in the private and in the public sector. Today, Thaler and Sunstein (2008) are enthusiastic about libertarian paternalist nudging in the private and in the public sector because they are impressed by the imperfection in individual decision-making and the low costs of nudging. They catalogue many factors that can lead to mistakes in human judgment and decision-making such as optimism, overconfidence, loss aversion, status quo bias, framing, inertia, inattention, error, etc.

In the meantime, modern public officials have more individual decision-making discretion than ever before. They are also better educated than ever. They also enjoy more job autonomy. However, this post-bureaucratic trend toward more job autonomy comes with strings attached. For example, more job autonomy and individual responsibility is also related to more stress and job intensity. Next, trends toward self-responsibilization and the growing importance of intrinsic motivators sometimes take forms of exploiting employees (Guest 2012, p. 55).

Again, numerous studies have also demonstrated that specific types of organizations that focus on job autonomy, learning opportunities, and teamwork have better operational and financial performance through enhanced intermediate outcomes such as increased job satisfaction and productivity and reduced turnover and less absenteeism. Current research in the field of organizational behavior is interested in exploring how employees' perceptions of organizational structures, HR policies, and leadership influence their work-related thoughts and behaviors and how transformational and transactional leadership supports organizational performance. Also, literature on engaging employees has become popular and advocates the link between engagement levels and organizational performance. The latter is the more interesting as different engagement levels seem to correlate with individual performance, organizational performance, and levels of innovation. There is also an emphasis on engagement that encourages and rewards learning and is positively linked to organizational performance. However, the level of engagement is depending on many variables such as the design of the work organization, leadership, work environment, working conditions, and the psychological contract between the employee and the employer.

Employees that rate their work organization, the support of their leaders, the work environment, and the psychological contract high have significant better results in work engagement as well.

Still, the literature on the importance of job engagement is far from conclusive and, even, skeptical, as the concept as such operates in "different worlds" (Guest 2012) and is concerned either with employee well-being or with organizational performance. Purcell (2014) argues that the concept lacks a contextual understanding and that the concept of engagement pictures a person "so engrossed in work that it can only ever apply to a minority of employees" (Purcell 2014, p. 242). This again leads to a negative view of employees who are not fully engaged and a psychologizing of employment relations where problems of motivation and "engagement" can easily be attributed to individual phenomena. "This is a dangerous reduction of work relations to individual attributes and failings" (Purcell 2014, p. 244). There is a clear danger that, increasingly, employees who are not fully engaged are described in negative terms implying this is their own fault... (Purcell 2014, p. 245). Self-efficacy theory explains why employees want to be engaged and committed. People with a strong sense of efficacy approach difficult tasks as challenges and are motivated through engagement. Consequently, employers want engaged employees, too. However, as already discussed, this "ideal combination" leads to a situation, where employers exploit their "engaged" employees without exchanges, for example, about offering decent work conditions.

## Toward the End of Bureaucracy, Bureaucracy-Lite, or the Return to Leviathan?

Looking into the relationship of governance reforms, HR policies, and ethics is a daunting task.

Today, experts hugely differ as regards the future of governance. For example, whereas some observers predict the total marketization of societies and public policies, others observe trends toward a sharing public sector and economy, others discuss the emergence of block chaining as the new reform fashion, and – again – others predict the return of the strong state, Leviathan, as security issues become ever more dominant in our societies. Again, another group observes trends toward a further professionalization of normative concepts like good governance and more state interventions in moral politics or toward more flexible forms of

governance which adapt themselves from policy area to policy area.

Thus, present governance developments are at least contradictory. From the inside, organizational reform trends are toward more fragmentation, flexibilization, decentralization, and individualization. From an HRM point of view, personnel management is no longer treated as a purely technical issue and an exclusive focus on issues such as recruitment, selection, payroll, benefits, employee relations, performance management, industrial relations, and legal issues. Instead HRM has become an integral part of management, organizational theory, and the behavioral sciences with an interest in all aspects of human life. Moreover, digitalization and flexibilization trends are changing work systems and leading to an individualization of HR practices by facilitating the monitoring, measuring, and recording of individual efforts and engagement practices.

Also, the field of civil service reform is subject of great speculation. Whereas in the past public administration and civil service reform was the preserve of legal scholars, today it is dealt with in management science, organizational theory, behavioral economy, leadership theory, organizational justice, motivation theory, social analysis of human interaction, organizational behavior, and law. Overall, public administration and HR reform – as academic disciplines – have grown in complexity. This mostly concerns the development of motivation theory, leadership theories, the link between HRM and organizational performance, and new evidence in the field of social dialogue, participation, and voice. Thus, public HRM tries to distance itself from its stuffy, technical, and traditional mechanical image and confirms its significance for corporate profitability, performance, and innovation (Pinnington et al. 2007) while balancing different employee's and employer's interest with the need for change, adaptability, discipline, and stability.

In fact, today, most governments shy away, through law, politics and the implementation of public management reform measures to impose any particular (bureaucratic) conception of a specific public service organizational and employment structure that differs to private sector practices. As it seems, national civil services are moving toward the emergence of a new sort of mixture between the revival of "Leviathan" concepts and blurred, decentralized, fragmented, and psychologized types of civil services. This makes it also difficult to say whether some aspects of the bureaucratic paradigm will survive or whether we experience the beginning of a new post-bureaucratic, high-performance work system paradigm, which is based on individualized HR management. For example, despite the popularity to criticize the overemphasis on laws and rules in contemporary civil services, the primacy of law is vital and will (hopefully) remain in the future.

Whatever will be the case, the classical bureaucracies are about to change. It is not yet clear what the post-bureaucratic paradigm is, apart from remedies to the weaknesses of the classical bureaucratic model. Still, developments like decentralization, responsibilities, flexibilization, skill development, engagement, mobility, etc. are too wide and too fluid concepts. These developments are also full of paradoxes and ambivalences. Consequently, they represent alternatives to the classical models. But does this also mean improvement?

Still, it is also far too early to predict the end of the bureaucratic model: Too often, popular public management reform is influenced by trendy management advisers who often spin an unrealistic yarn about administration by giving the impression that hierarchic and bureaucratic administrative structures have long since ceased to exist. Despite trends toward more individual job autonomy and responsibilities, almost all administrative models also continue to be based on the principle of "hierarchy" and bureaucracy. An empirical study by Vie (2010) concludes that post-bureaucracy is "only a language construction that has little impact on everyday practice in organizations. Especially the proclamation of a general downfall of hierarchic structure in organizations stands in sharp contrast to the empirical reality" (Vie 2010). In fact, reported radical breaks from the past are exaggerated. In reality, new elements of work practices are gaining ground without replacing old ways (Vie 2010, p. 191). Vie concludes that the work

practices of top managers change faster than of middle managers who are still preoccupied with administrative routine and bureaucratic control.

What is sure is that contemporary central public administrations are increasingly complex and fragmented. In the future, they will most likely become more complicated and probably more contradictory all the time. Consequently, value conflicts are increasing, too. What are the implications on ethics and workplace behavior?

New societal trends toward individualization, informalization, digitalization, globalization, and intensification of work produce new forms of ethical challenges for government. Overall, it seems that new types of work systems also produce new dilemmas and paradoxes, such as enhanced job intensity and stress levels. This also suggests that the current departure from rational and hierarchical types of (bureaucratic) organizations will also bring new, so far, unknown challenges.

In *The Responsible Administrator*, Cooper argues that "we are in a time of transition in which the modern heritage of public administration is increasingly in conflict with a postmodern model" (Cooper 2006, p. 45). The key phenomena of modernity are assumptions about universal values, absolute values, bureaucracy, and rationality. Contrary to this postmodern is a term in which "fundamental assumptions are being discredited as final and absolute. Assumptions about objectively real and universal human nature, or natural law, or absolute values and ultimate truths (. . .) no longer hold. . ." (Cooper 2006, p. 46). "The homogeneity of traditional society, with its unifying and stabilizing cultural bonds, has been broken. (. . .). New forms of lifestyles have developed, and new ways of coping with a broad spectrum of lifestyles, diets, preferences, political philosophies, and modes of exchange have evolved" (Cooper 2006, p. 52).

The implications of these changes for public administration are obvious: Today's public administrations tend to be much more diverse, less hierarchical, more flexible, diverse, representative, and less separated from the citizenry. Whereas the term bureaucracy represented clear values (hierarchy, formalism, standardization, rationality, obedience, etc.), new reforms bring new values but also more conflicting values and value dilemmas.

Thus, the problem with this description of the administration in the twenty-first century is obvious. Whereas the term "bureaucracy" or "modernity" can be defined and broken down into concrete contents, this is much less the case with the definition of new systems and new administrative models. Although the terms post-Weberian models or post-bureaucracy may be adequate descriptions of the current change processes, these concepts leave those who oversee introducing change processes puzzled. Overall, we do not only lack an understanding of what could be an (universal) alternative to the bureaucratic form of organization.

Instead, what is also missing is a better understanding how ethics change in the context of governance and organizational and HR changes. So far, discussions have focused on the link between public management reforms and ethics but to a much lesser degree on the effects of civil service and HR reforms. Academic discussions are still very rudimentary.

As of the 1990s, experts started to call for an alternative to the bureaucratic "compliance-based" ethics model, the so-called "value based" model. In the beginning, discussions on this alternative model were highly influential and successful. Many countries started to move away from legal and top-down approaches. For a number of years, changes had been in progress. However, since a number of years, reforms do not indicate convergence toward a new value-based model. Let us take a step back to look at these interesting trends.

According to Weber, the essence of administrative behavior is to follow legally given orders. Following this, at a minimal level, administration was good and ethical if it achieved the implementation and enforcement of the existing laws and policy goals of the government of the day. Moreover, ethically good or acceptable behavior was also defined in terms of obedience to the law, impartiality, and standardization. The purpose of rule orientation was also to achieve fairness and equity, to implement the merit principle, to allocate rights to citizens, and to protect public

employees against arbitrary administrative decisions. Thus, "the ethics of neutrality and structure" (Thompson 1985, pp. 555–561) is the cornerstone of the traditional bureaucracy. From the ethical point of view, following the law or the superior's orders is usually not problematic, if obedience and excessive adherence to rules do not become absolute values.

However, the problem with the Weberian concept is that as an ethical guideline, it is simply too narrow for today's multilevel governance. As already discussed, work in the public sphere is much more complex, digitalized, fragmented, individualized, and no longer dominated by the principles as Weber predicted. On the other hand, some traditional principles such as the rule of law and administrative law as such remain the core principles of all administrative systems.

However, with the emergence of NPM euphoria, administrative law was mostly seen as a constraint that blocks policy choices, innovation, and reform policies. Traditional administrative behavior was held to be rigid, rulebound, centralized, and obsessed with dictating how things should be done – regulating the process, controlling the inputs – but totally ignoring the end results. Consequently, NPM theories dominated from the 1990s onward, and the compliance approach was old-fashioned and ineffective. Suddenly, the focus was on codes of ethics, training, leadership, decentralization, delegation, and flexibility, instead of on law. As a result, discussions focused on the adoption of new digital, soft, informal, and managerial approaches and a call to move away from regulatory approaches.

In the meantime, academic discussions have turned away from the "grand old" dichotomy: value-based approaches versus compliance-based approaches. This can best be seen in the field of conflicts of interest, where countries have started to realize that the management of conflicts of interest does not work without clear rules, formal procedures, monitoring, and strong enforcement mechanisms but also not without awareness raising, strong leadership, independent ethics committees, registers of interest, and more and better management capacity. Most "compliance-based" countries such as Germany no longer focus entirely on rules and trust in the effectiveness of sanctions. However, the focus on both concepts has lost much of its appeal, since the focus on NPM theories (and an excessive focus on rational choice theories and soft instruments) as much as on classical bureaucratic approaches is in both cases also revealing many negative effects.

This means that the circle of new ideas and concepts has started again. Here, the focus is no longer on private sector models, or on new soft-managerial models. Instead, it is about the search for more efficiency, effectiveness, quality, better outcomes, and citizen orientation. In fact, it is all about better administration and the ongoing search for new good governance models in a digital governance context.

These trends show that the increase of complexity of societies corresponds with the increase of complexity of ethics as such. Neither the compliance-based nor the value-based approaches give an answer to these developments. Instead, discussions on the best ethics policies, best practices, and effective ethics instruments have become more context-oriented. At the same time, ethics bureaucracies are about to emerge. Overall, ethics policies become more important and countries invest in the institutionalization, monitoring, and enforcement of ethics policies. Still, many doubts exist whether these trends enhance the effectiveness of ethics policies, improve trust levels, or just produce ever new forms of integrity paradoxes.

## The Psychologization of HRM

Current trends in HRM have opened public employment for ever more diverse employment innovations. Whereas most governments agree that politics should not try to form the character or cultivate the virtue of its citizens, the increasing popularity of behavioral ethics and affective turns in politics, HRM and in economics and the popularity of nudging (as an instrument), destandardization trends and the trend toward the delegation of own responsibilities to employees

through different concepts such as engagement, lifelong learning and competency-development (as HRM policies) show that current trends in HR policies are leading toward an individualization and "psychologization" of HRM (Godard 2014).

These developments run counter to a grand administrative tradition: For a long time, HRM in the public sector was dominated by rational, legal, standardized, and technical approaches. Today, traditional HRM is in trouble, both theoretically and practically because it is challenged by ethical, financial and budgetary, behavioral, managerial narratives and developments in the neurosciences (Thompson 2011, p. 363). Currently, the discipline of HRM integrates new evidence, especially from the behavioral sciences. This is a reaction to the traditional focus in the field which was based on legal, economic, and political ideas that ignored psychological aspects, although evidence existed since the Hawthorne Experiments (and even well before) that individual behavior is largely influenced by justice and fairness perceptions, emotions, and feelings, such as hope, fear, aspirations, expectations, etc. Instruments such as *nudging* have become tremendously popular. For example, in the field of ethics, approaches that are based on laws and compliance-based approaches are believed to be ineffective since they guard only against intentional forms of unethical behavior (and not unintentional forms). Disciplines like behavioral ethics explain why people overestimate their ability to do what is right and why they act unethical without meaning to (Bazerman and Tenbrunsel 2011). This turn toward behavioral approaches can be explained because of the shortcomings of traditional (bureaucratic) approaches. However, they are neither new nor without problems.

Almost 100 years ago, Parker Follett argued in The Giving of Orders (1926), you "cannot get people to do things most satisfactorily by ordering them or exhorting them; but also that even reasoning with them, even convincing them intellectually, may not be enough (. . .). For all our past life, our early training, our later experience, all our emotions, beliefs, prejudices, every desire that we have, have formed certain habits of mind . . . Therefore, it will do little good merely to get intellectual agreement; unless you change the habit pattern of people, you have not really changed your people" (Parker Follett 1926).

Some decades later, Lindblom suggested that "decisions within this political setting can never be wholly rational but (. . .) are of a "bounded rational" nature. That is to say, instead of insisting on an "optimal solution," the public policy maker must be satisfied with what is "good enough," or as Lindblom suggested: must "muddle through" (Lindblom 1959).

In the 1950s Simon did not deny the possibility of change processes as a result of rational processes. However, he showed that organizations never work purely rationally or perfectly: "We forget sometimes that an organisation is a group of people behaving, These people are not tools or machines. They have feelings, hopes, and fears. They get sick, hungry, angry, frustrated, happy, sad. Their behaviour is subject to a whole range of influences extending back to their births. . ." (Simon 1973, p. 55). According to Simon, it plays the most important role in the day-to-day work of every organization. Without communication, no steps can be taken toward human cooperation, and it is impossible to speak about organizational problems without speaking about communication. At the root of public administration are continuous conflicts and communication blockages due to:

- Barriers of language (misinterpretation and misunderstanding)
- Differing frames of reference (different mental understanding of definitions)
- Geographical distance impeding the communication process (over Units, Countries, Ministries)
- Status distance as a filtering process throughout hierarchical levels of organization
- Self-protection (individuals tend to communicate more those things that are to their benefit)
- Pressure of work (people tend to overlook important matters)
- Censorship (limitations on the flow of information by authority or force)

Thus, already many years ago, experts arrived at the conclusion that, in reality, work in the public sector is paradoxical, individual, value-laden, emotional, pluralistic, political, and unpredictable. Weber and Taylor neglected the importance of individuals because of their focus on the concept of "administrative neutrality" and the dominance of rational and legal approaches. There is no place to confront the two approaches and to discuss all pros and cons. In fact, the ultimate measure of any HR system is the quality, efficiency, impartiality, professionalism, and responsiveness that it delivers and how it furthers the possibilities to reach and fulfil objectives and helps delivering services of good quality to citizens. New behavioral approaches are to be welcomed if they do not lead to a new "moral relativism" and the revision of rational thinking as such. With the popularity of behavioral insights (OECD 2018), classical concepts (and instruments) such as the rule of law and principles of administrative law are questioned.

## The Destandardization and Individualization of HRM

As discussed, the key phenomena of modernity were assumptions about universal values, absolute values, bureaucracy, and rationality. Contrary to this, present reform trends discredit universal and absolute assumptions (Cooper 2006, p. 45). According to Fukuyama (2018), universal concepts are being challenged by partial forms of recognition based on nation, religion, sect, race, ethnicity, or gender or by individuals wanting to be recognized as superior. "The rise of identity politics in modern liberal democracies is one of the chief threats that they face. . . ." (Fukuyama 2018, p. xvi).

Also, in the field of public management, the era in which treating all persons in the same way meant treating everybody fairly is not anymore the paradigm of our times. Consequently, theories on organizational justice are gaining in importance and HR administrators, and line managers need to rethink how to measure performance and to treat people unequally and yet to be fair (Karam et al. 2019). Therefore, a new challenge is to design fair HR systems under decentralized and individualized conditions, "the challenge in the longer run . . ..is to design organizations that combine the efficiency and service capacity of decentralized organizations with the uniform and legalistic nature of hierarchical organizations" (Peters and Pierre 2003, p. 6).

In the field of HRM, destandardization, diversity, and individualization reforms have been introduced in a wide range of HR policies and HR structures (OECD, 2017a). This concerns the:

- Destandardization and flexibilization of working time
- Destandardization and individualization in pay (through trends toward the differentiation of pay and performance-related pay)
- Destandardization of recruitment methods and procedures which were based on qualifications and not on skill development and competencies
- Destandardization and individualization of training, e.g., coaching and career development policies
- Destandardization and individualization of skill development and competency management policies
- Flexibilization of retirement policies and retirement ages
- Flexibilization of contracts and employment policies
- Introduction of diversity policies
- Decentralization of HR competences to line managers
- Reform of the organization of work and provisions for more job autonomy
- The possibility for more public-private, interministerial, intraministerial and intra-career mobility
- The abolishment of traditional career progression policies such as automatic seniority progression

All these developments create new opportunities but also new challenges. For example, destandardization trends have arguably placed the morality of legal approaches and standardized and merit-based HRM practices increasingly in the hand of managers, line managers, and HR experts who have discretion and decision-making

powers in these fields (Bezes and Jeannot 2018). The decline of standardized approaches has left many employees more vulnerable to individual discretionary, opportunistic, and subjective behavior. This throws more into question "the morality of contemporary HRM and increases the significance of engaging in moral evaluation of the behavior of directors, managers and HR practitioners" (Pinnington et al. 2007, p. 3). On the other hand, these trends toward destandardization of HR practices, visions on self-reliant individuals, and trends in the field of individual competency and skill policies also challenge classical merit-based concepts. How to maintain merit, fairness, and equal treatment in a fragmented, decentralized, and individualized context? In former times, HR policies were based on the principle that everybody should be treated in the same way in order to be fair.

### The Destandardization of Remuneration and Fairness Perceptions

For a long time, civil servants in the same age cohort, with the same rank and the same qualification, were paid the same salary (which, often, was increased regularly in conformity with the principle of seniority and automatic pay progression). Traditional remuneration systems were established decades ago, and for a long time, they changed very little. The traditional focus on careers, stability, seniority, and positions made sense when the vast majority in the public service had similar qualifications and jobs. The classical pay system was adapted to the dominant values at the time: bureaucratization, standardization, and equality. Thus, whereas public pay systems were based on the principle of equality, private sector pay systems were based on the principle of autonomy today, the era in which treating everybody the same meant treating everybody fairly is not anymore the paradigm of our times. Today, most people believe that everybody should be treated equally but also differently in order to be fair (Cooper 2006, p. 53).

Consequently, traditional pay systems with their career ladders, time-based pay increases, and specific allowances are increasingly reflecting a slowly disappearing concept of employment. That model was designed to reward loyalty by providing high levels of job security. Today, employees themselves expect immediate rewards and recognition for their individual accomplishments. So far, little research has been carried out on the impact of destandardization trends and the change of merit-based approaches on workplace behavior and perceptions of organizational justice (among employees). Overall, pay diversity as such has increased within the national systems and among the different occupations and ranks. Also, the structure of the systems has become more diverse. For example, today it is perceived as fair if civil servants earn higher salaries if he/she demonstrates outstanding performance and receives positive performance evaluations. However, this logic also leads to the question whether and how professional and fair performance assessments are possible at all that justifies unequal pay. This trend toward pay dispersion creates problems if managers fail to increase employees' perception of legitimacy of pay dispersion (and organizational fairness perceptions), which suggests that procedural fairness of the HR systems can maximize the effectiveness of distribution of organizational resources, such as pay.

Public employees constantly compare their performance with the performance of their colleagues (note: and mostly believe that they are better than others). Often, employees believe that their pay is not fair since they perform better than their colleagues. Many also believe that their performance is not managed, assessed, and measured in a professional way. Consequently, fairness perceptions have changed and differ from the past. From now on, new feelings of being treated unfairly (e.g., by those who measure performance levels) emerge, and, in many instances, people are even more demotivated and frustrated after the introduction of PRP. Since people constantly compare themselves with other colleagues, they also tend to believe that colleagues who receive bonuses and PRP do not deserve them. Often, employees who do not receive PRP may also be demotivated since they expected to get bonuses, etc. Another dilemma concerns the fact that many employees do not trust their superiors to take fair decisions on the allocation of PRP. Consequently,

many people feel that they are treated unfairly because of unprofessional or unfair pay decisions of their superiors. In all these cases, the expectation to be treated individually conflicts with the expectation to be treated equally. As it seems, the individualization of pay and growing differences in pay also produce higher levels of perceptions of distributional injustice.

However, exactly because of the ongoing individualization trends, people are increasingly attentive to the justice of events and situations in their everyday lives across a variety of contexts. Increasingly, individuals react to actions and decisions made by organizations every day. Consequently, perceptions of unjust and unfair treatment can strongly influence the individual behavior and may exert a good or bad impact on individual and organizational performance.

### The Destandardization of Recruitment Policies and Fairness

In the past, national civil services always used common and standardized recruitment frameworks (such as concours). Overall, people were recruited based on qualification (and diplomas). Most countries also installed merit-based recruitment systems that set common standards for civil servants to meet through, for example, standardized testing. These systems were designed to ensure a high degree of professionalization (as opposed to politicization) of the civil service and to ensure that all applicants are provided with equal opportunities. While such systems responded to values of internal equity, professionalism, and equal access, they were criticized because they underperformed in a context of competition for particular skill sets (OECD 2017a, p. 75). Moreover, they underperform because they are based on skills and qualifications (ratings) that were achieved (and evaluated) in the past and not on the development of new (social and technical) skills and (soft) competences. Today, politicians and managers repeat the mantra that economic competitiveness depends crucially on the skills and investments in training of the workforce. Everywhere, governments, politicians, and management experts agree upon the key role that skills, training, and lifelong learning play in securing competitiveness and social cohesion. Within this discourse, it seems that skills are the answer to a whole set of economic and social problems. With the increasing importance of skill policies, also the notion of skills has also become considerably broader than it was in the past. Today, the popular skill discourse uses very different notions like enlarging basic skills, employability skills, adapting skills, key skills, management skills, future skills, IT skills, and leadership skills and a variety of meanings such as soft skills, transferable skills, interactional skills, problem-solving skills, social skills, IT skills, and networking skills. The term skill as such has become indistinguishable from personal characteristics, traits, competences, behaviors, and attitudes. Consequently, policy makers increasingly insist upon the diffuse using of skills. Why have skill development policies become so important, other than because of economic factors? One of the main reasons is the shift from traditional and hierarchical structures toward "flat" services and more job autonomy, with the need for employees to have more relational, communicative, and problem-solving soft skills. However, technological developments and organizational renewal are not the only factors that require skill renewal. Overall, the decentralization, fragmentation, and individualization of structures and processes also require the decentralization and individualization of skill development and training policies. Trends toward more individualistic HRM approaches can best be seen in the field of training, where standardized training activities are increasingly replaced by tailor-made programs and individualized coaching offers, which are more frequently based on concrete individual needs and whose main concern is the transfer of competence. Moreover, countries increasingly try to recruit, promote, and reward civil servants based on specific competency and skill sets – in a competitive market. For example, the digitalization of public administration requires employees to quickly adapt to digital change. Civil servants are needed who have the skills to address increasingly complex problems in increasingly pluralistic societies using new tools available to governments. They will need to understand the potential and risks of new technological tools, to

develop skills complementary to these new tools, and be comfortable in an increasingly digital workplace and using digital tools. Therefore, more countries are expecting their civil servants to take a proactive approach to their jobs (OECD 2017a; 2017b, p. 15).

Public administrations respond to the new challenges by a destandardization and individualization of recruitment policies and the alignment and fine-tuning of recruitment methods to specific skills needed (OECD 2017a, p. 76). Increasingly, this is done by the introduction of more diverse and external recruitment practices, or separate practices, for example, for top officials. Moreover, different public administrations increasingly design specific competency profiles for different categories of employees. However, this trend toward different competency expectations, skill development ability, and self-reliance on skill adaptation marks a clear departure from the traditional view of the compliant bureaucrat (OECD 2017a, p. 61) and standardized recruitment policies. Today, countries wish to develop employment policies and recruitment frameworks that are driven by individual qualities, skills, and expertise (OECD 2017a, p. 10) in order to match new skill requirements and competency developments. All these trends challenge the fairness and merit-based recruitment, promotion, and reward-based systems and raise the question how individual skills – under decentralized and individualized conditions – are designed, evaluated, and assessed (OECD 2017a, p. 67). At present, destandardized recruitment systems are more vulnerable to integrity violations than standardized systems. During the last years, especially the decentralized and destandardized central European civil services have been increasingly politicized and polarized.

## The Effects of Change

As long ago as 2000, Paine published *Does Ethics Pay?* and discussed the added value of ethics (Paine 2000). While evidence is indeed mounting that ethics are related to organizational performance and organizational performance to ethics, significant methodological and theoretical challenges still exist. Consequently, research is still relatively silent in this field, although it is badly needed. Methodologically, there is no consensus regarding which practices constitute a theoretically complete set of ethics policies; how to conceptually categorize these practices, the definition of ethical performance, the link between ethics and organizational costs/benefits, and discussions on the effectiveness of incentives; or how ethics and ethical leadership are to be measured. Theoretically, there is still no consensus regarding the mechanism by which ethics might impact on outcomes. For example, in the field of public management, sound empirical knowledge exists only as regards the positive link between meritocratic structures and lower levels of corruption and politicization. Therefore, more empirical studies and more non-ideological deliberations in the field of ethics are badly needed if we are to better understand ethical promises, challenges, and limitations. One of these challenges is to understand how government and HR policies are changing and how this impact on ethics and workplace behavior.

Strangely enough, the interest in the link between HRM and ethics has not kept pace with the increase of interest in business ethics. Surprisingly, there is very little research on the link between HRM and ethics. Given the many initiatives in the field of managerial ethics, corporate social responsibility, and company ethics, one might expect a similar growth of interest in the field of civil service reform, HRM, and ethics, too. "After all an extremely important component of making business more ethical is to take seriously the ethical aspects of managing people" (Pinnington et al. 2007, p. 2). As we will see later, bringing ethical awareness into public policies and HR policies is even more important given the recent governance and HR trends toward more destandardized and individualized HR approaches. These trends place additional burdens on managers and the need for ethical leadership.

After all, ethical challenges abound in HRM. Each day, HR managers and leaders "change, shape, redirect, and fundamentally alter the course of other people's lives" (Margolis et al. 2012, p. 237). Failures and successes in carrying out these tasks have an important impact on

workplace behavior, fairness perception, job engagement, and performance.

Of course, the question where do all civil service and HR changes lead to? is difficult to answer: The question of what has resulted from the many reforms is obviously a fundamental one. Yet it is not at all simple. Experts have no clear understanding of how public administration is changing. There is also little evidence as to whether change processes produce better results; and if so, which change processes and which reform instruments? Unfortunately, the field of civil service reform is loaded with theories that reflect personal opinions, images, and perceptions. To avoid making ideological or personal judgments about the effects of reforms, it may be wiser to start from a general point of view to which the outcomes of civil service and HR reforms can be positive and/or negative and effective and/or ineffective, but they may also produce a number of unintentional positive and negative side effects, such as more bureaucracy, higher stress levels, more job intensity, less job control, higher leadership skill expectations, more ethical challenges, conflicts of interests, etc. Thus, the difficulty seems to be to accept that current reforms have various reform effects at the same time.

Moreover, effects of reforms depend on many variables such as of budgetary constraints leadership developments, skills, perception of organizational justice, organizational culture, and institutional configurations. In *Organizing Leviathan: Politicians, Bureaucrats, and the Making of Good Government* (2018) Dahlström and Lapuente show that systems that are based on merit have lower levels of corruption and higher levels of government effectiveness. Despite the fact that merit is an important element of bureaucratic systems, bureaucratic systems have no positive effect. However, concepts of "merit" are also changing. Paradoxically, the more the concept of meritocracy has become a reality, the more it seems to legitimate a hierarchy of privilege. The dilemma with the principle of meritocracy lies with the problem that our systems which reward talented people leave no hiding place for those who fail in the competitive struggle. Thus, the consequent application of the merit principle seems to undermine one of the most important foundations of the national public administrations: the principles of fairness, equality, and equity. In their publication, *Diploma Democracy – On the Tensions between Meritocracy and Democracy*, Bovens and Wille (2009) show that Plato's ideal of the state which is run by the best and the brightest has (almost) become a reality.

Merit, as the basis for employment decisions, is one of the core values. Yet employee faith in the application of merit principle appears to be in decline in many countries because of increasing levels of corruption and politicization. A further serious deficiency is the absence of discourse on how the implementation of the merit principle in the civil services does not do justice to the increasing differences in pay, status, reward, and power. Another problem is that the principle of meritocracy is increasingly self-defeating, "The more opportunity there is for people to succeed in society, the less value such success is likely to have for them" (Dench 2006). If all people invest in more and better education and invest in their competences and skills, the process ends as a race to the top. Everybody is likely to become disappointed quickly. "If there is one thing worse than being blocked, it is seeing others succeed where you have failed" (Dench 2006, p. 190). At least from these points of view, the new civil services are not necessarily fairer than the traditional structures.

Parallel to this, perceptions of organizational injustice and requests for individual recognition and feedback are gaining in importance. Experts in the field of organizational justice (Molina et al. 2017) often make a distinction between distributive justice, procedural justice, and interactional justice. As such, the importance of injustice perceptions is not new. Already in the eighteenth century, Immanuel Kant concluded that nothing causes more indignation than injustice. However, today, perceptions of increasing levels of inequality correlate with increasing perceptions of lack of recognition of "identity" and higher expectations that people want to be recognized. Fukuyama claims that indignation and perceptions of injustice are mostly caused by a lack of recognition (Fukuyama 2018). In fact, it seems that the demand for identity, diversity, and recognition is also increasing in the field

of HRM. Increasingly, people are attentive to the justice of events and situations in their everyday lives across a variety of contexts and to various actions and decisions made by organizations and their leaders every day. Unjust and unfair treatment and the perception of a lack of recognition can strongly influence the individual behavior and may exert a good or bad impact on individual and organizational performance.

## Conclusions

If governments want engaged, satisfied, and ethical employees, they must accept that "employee engagement is best seen as an outcome of managerial activity to build perceptions of trust, fairness and organizational justice, especially procedural and interactional or interpersonal justice. These are the antecedents of engagement. The question remains on how trust, fairness and justice are built. Each are essentially processes of the quality of interactions between management and employees" (Purcell 2012, p. 13). Unfortunately, reforms in times of budgetary constraints have led to lower levels of trust in leadership, less job satisfaction, higher levels of stress, more inequality in working conditions, fragmentation of approaches and working conditions, and increasing perceptions of organizational unfairness.

Still, presently government employment systems are corresponding better to a Rawlsian principle of justice than current trends in the private sector which produce many forms of injustice and sometimes perverse results about the rewarding of individual performance. However, future civil service reform is becoming more paradoxical. Whereas in former bureaucratic times, it was believed that everybody should be treated in the same way to be fair. Today, most people believe that people should be treated differently to be fair (Cooper 2006, p. 53).

At present, all discussed trends challenge the classical arguments for a specific civil service and the traditional link between government, civil services, and ethics. Despite this, there are reasons to expect that, also in the future, civil service policies and public HR policies will continue to apply some specific bureaucratic features that will remain in place to sustain the principle of rationality and separation between the public and private sector and to defend core democratic values like equality, fairness, and legal security. No other institutional actor can combine expertise, continuity in office, and professionalism with impartiality and fairness. Because of this, the twenty-first century needs civil services and civil servants more than ever – but in different contexts (Raadschelders et al. 2015, p. 369).

# Civil Service Reforms and Governance Challenges in Nigeria

Ogbewere Bankole Ijewereme
Department of Public Administration, Obafemi Awolowo University, Ile-Ife, Osun State, Nigeria

## Synonyms

Bureaucracy; Government; Institution of the state; Machinery of government; Management of nation's affairs, Public service; Reorganization

## Definitions

**Civil service**: The term civil service is often used as the machinery of government or institution of the state, and it is synonymous with bureaucracy or government in Britain and in most Commonwealth countries. In the British conception, which has in fact become universal, the term civil service is used in two major perspectives. First, it refers to a group of permanent officers appointed or recruited to assist the political officeholders in formulating and implementing government's policies. These officials are referred to as civil servants who work in the civil service or public service. In the second perspective, the term means ministries and departments within which the tasks of government are executed.

**Public service**: The term public service is broader and more inclusive. The first definition is that public service refers to government parastatals, which are the operational arm of government ministries as well as the ministries, departments, and agencies (MDAs). The public service, in addition to the civil service/bureaucracy, encompasses the armed forces, judiciary, police, parastatals, government-owned companies, and statutory agencies.

**Governance**: The term governance refers to the exercise of political power to manage a state's or a country's affairs. Governance requires state's officials or state's bureaucrats to exercise political or bureaucratic power ethically, impartially, accountably, transparently, and result-orientally.

## Introduction

The civil service is an integral part of public service governance of any country that is germane to her national development. Through civil service such as ministries and departments, government implements policies and programs that provide services which stimulate economic growth and development at all levels and increase trust and connection between the government and the people. However, in order to ensure effective running of government, systems and processes are developed not only to guide the operators of the system but also to ensure strict compliance with them (Pepple 2013). This is one of the measures of governance – enforcing accountability in the system and promoting integrity, efficiency, responsiveness, and trust through its consistency of application of rules and regulations for the predictability of actions. Besides, doctrine of neutral competent is practiced to ensure that permanent officers, occupying position, duly subordinate to ministers/commissioners yet possessing sufficient independence, character, ability, and experience to be able to advise, assist, and, to some extent, influence and complement the political leaders in the governance of a country, to uplift the well-being of the citizenry (Adamolekun 2013; Pepple 2013).

Despite the above governance mechanism, the performance of civil service in Nigeria has been replete with varying contradictions due to lack of vision, unethical practices, cluelessness, parochialism, attitudinal debauchery, credibility and legitimacy crises on the part of political leaders, politicization of the Nigerian civil service, inappropriate application of federal character which often compromises merit in recruitment of bureaucrats, etc. Ms. Amal Pepple, a former minister and head of the Civil Service of the Federation, is of the opinion that the negative practices in Nigerian civil service include bureaucratic partisanship, political interference in the affairs of the civil service, decay of administrative training capacity despite the huge investment of domestic and donor resources in capacity development over many decades, growing dominance of non-meritocratic (federal character) consideration in the appointment of permanent secretaries and directors, and the award of contract without due process, with attendant inefficiency in the civil service.

Available literature shows that before independent and 1960–1966 Nigeria federal and regional civil service governance were replete with competent, impartial, nonpartisan, exceedingly efficient, and incorruptible top bureaucrats with sense of mission devoted to their onerous duties. The above bureaucratic characteristics were witnessed because the political leaders articulated a clear vision and mission as well as emphasized meritocracy in recruitment of bureaucrats. Unfortunately, since 1966, through successive military and civilian regimes till date, Nigerian bureaucratic governance is replete with poor leadership and weak bureaucratic institutions (Adamolekun 2013; Ijewereme and Dunmade 2014; Ijewereme 2015).

Despite the depth of literature on civil service and governance in Nigeria, there is very little known about the relationship between political, bureaucratic leadership and civil service's governance within the context of historical narrative of bureaucratic recruitment in colonial and post-colonial era, reforms, and challenges/problems, hence this study.

## Role of Civil Servants

Once the policy decision has been taken by the minister or commissioner, a civil servant must loyally carry out the policy chosen, even though he or she disagreed with the decided option. It is the task of the civil servant to have all past experience put at the service of the ministry and offer constructive suggestions developed out of this experience. They engage in constant data, and fact gathering of every government decisions, and preparing findings that may lead to changes in policy or lead to policy decisions. In this way, top bureaucrats assist to define policy before the legislative stage is reached; they help in drafting the law which is designed to carry out the desired program of government. Besides, the higher bureaucrats/administers define and execute post-legislative policy, particularly where such policy involves the sustenance of the program or possible legislative revisions or where it involves the machinery for the enforcement of such legislation (Adebayo 1981).

**Civil service stands for continuity:** The civil service serves as vehicle for continuity of governmental policy. Government comes and goes but the civil servants remain permanent. The civil service is a corrective of party government. This is because the concern of the civil service is for the good of the nation as a whole, irrespective of the political party in power. Its duty is to place before every minister comes to power the national point of view. To perform the role effectively, the civil service observes strict political neutrality while ensuring the continuity of policy based on overall national interest (Adebayo 1981).

**Political neutrality:** One of the most cherished traditions of the civil service in the Commonwealth is its neutrality and apolitical nature. Civil servants are not supposed to be members of political parties. In a similar vein, civil servant administrators must serve the government or ruling party with a high degree of loyalty and dedication and must not allow personal interest to affect their jobs. To achieve neutrality, top civil servants like heads of civil service and permanent secretaries are appointed on merit basis. Bureaucratic neutrality helps to engender confidence in the institution as a force especially in a highly diverse country as Nigeria (Pepple 2013). However, friction may arise when attempt to drag or coerce higher bureaucrats to pursue narrow partisan interest which is against national interests. Top bureaucrat has a choice for the interest of the nation to resist by acting professionally (Pepple 2013), but when the higher public servant acts on his personal and political boss selfish interests, the entire nation suffers.

## Functions of Political Leaders in the Ministries

A former permanent secretary, head of service, and federal minister, Amal PEPPLE, describes below as the tasks of ministers/commissioners in Nigerian civil service.

**Ministers/commissioners:** They are individually and politically responsible for each act and every act of their ministries and are to work with their officials, particularly the permanent secretary in performing their duties; they seek impartial advice and information from the permanent secretary in arriving at decision on issues through building confidence and trust with their permanent secretaries; they demand loyalty and cooperation from officials in their ministries, departments, and agencies (MDAs), and they expound government policy (Pepple 2013).

## Functions of Administrative Leaders in the Ministries

**Permanent secretaries:** They are the administrative heads of their ministries and are responsible to the minister/commissioner for the implementation of approved policy and for the efficiency and effectiveness of staff; they are chief advisers to their ministers/commissioners; they ensure that ministers/commissioners are kept abreast of developments in all subjects in the ministry's portfolio, including ensuring that financial implication of every subject is thoroughly examined before it is submitted to the minister. The permanent secretary is responsible for co-coordinating

the work of all departments in the ministry; he is the accounting officer and is, therefore, responsible for the preparation of estimates for the control of expenditure and accounting for all money allocated to the ministry for the smooth running of such additional financial duties as may from time be delegated to the ministry (Pepple 2013). Permanent secretaries are usually officers on grade level 17.

## Historical Overview of Civil Service in Nigeria

### Nigerian Public Bureaucracy Under the British Rule

1. **The law and order stage of 1890–1910**: Extant literature shows that British government assumed direct responsibility for the administration of Nigeria on New Year's Day of 1900 (Omitola 2012). The traditional function of the British government during the above periods was the maintenance of law and order aimed at ensuring peace within the system.
2. **The consolidation stage of 1910–1925**: This era was the commencement of a legal-rational order and a modern bureaucratic system. This period witnessed hierarchical leadership practices, which occasioned traditional rulers to pay allegiance and answerability to the British Crown.
3. **The economic development stage of 1925–1945:** During this era, the colonial public service built infrastructures such as roads, bridges, primary and secondary schools, and railway networks. Other developments include building of dispensaries and provision of pipe-borne water.
4. **The political development stage of 1945–1952 and the transition to independence and stage of rapid Nigerianization from 1952 to 1960**. The political development stage witnessed the end of the Second World War which opened the eyes of Nigerians to the values of political independence. The transition to independence witnessed high demands for the Nigerianization of the public bureaucracy which was largely achieved in October 1, 1960, when Nigeria attained independence.

However, the precolonial public bureaucracy was concerned mainly with law and order to ensure peace and prevent anything that would jeopardize the interest of the system without much deliberate efforts in planning sociopolitical economic development of Nigeria, although meritocracy was the only criterion for recruitment of bureaucrat within the precolonial era (Idada 2000).

## Nigerian Public Bureaucracy from 1960 to 1966

The period between 1960 when Nigeria got her independent and 1966 when the first military coup was experienced was an era Nigerian civil service or bureaucracy had to adjust and consolidate the political gains of the colonial master in the area of maintenance of peace and order. Governance role during this period changed to conflict resolution and deliberate planning of economic, social, and political development (Idada 2000).

Several political upheavals challenged the independence of Nigerian civil service. These include, among others, the political disturbance, chaos, and anarchy in Western region which led to the declaration of a state of emergency. Also, the Tiv riots that threatened the Northern region government, the census crisis of 1963, the general strike of 1964, and the deadlock of the federal election in 1964 which culminated in the January 15, 1966, military coup created an entirely different atmosphere for the working of civil servants. In spite of these difficulties and crises (which did not allow the governments to groom the public bureaucracy to cope with the realities and needs of modern government), the bureaucrats did excellent jobs in the opportunity given to them majorly in taking initiatives, assisting government in formulating and implementing policies (Idada 2000). Accordingly, the civil service attracted the best brains. All the top bureaucrats worked toward the same objective and goal but with likelihood of different methods and approaches.

## Nigerian Civil Service (1966–1979)

The military seized power from civilian administration on January 15, 1966. The military head of states, General Ironsi, unified all the federal and regional civil services with a Unification Decree. This was, however, reverted back to its former decentralized status in July 1967 by its successor, General Yakubu Gowon.

Military rule epitomized an unfamiliar terrain for military leaders; hence, Gowon administration had to depend on the public bureaucracy initially for everything they needed to do in government in terms of decision- and policymaking instead of the bureaucrats acting in advisory capacity to the political executives.

However, various political developments during the period which accounted for increasing prominence of the bureaucrats in the administration of the country include the absence of political heads of the ministries, namely, ministers. Even when political heads were eventually appointed, they lacked the influence and the mandate exercised by them during a civilian dispensation (Omitola 2012). Thus, the loss of political power became the gains of civil servants whose influence increases tremendously (Omitola 2012).

The era of Yakubu Gowon witnessed over involvement of the highest position in the civil service such as permanent secretaries in the governance and day-to-day running of the government to the extent the administration was enmeshed in corruption, nepotism, favoritism, and insensibility and gradually becoming ineffective and inefficient in the discharge of their duties, and the Weber's ideals of anonymity, neutrality, impersonality, and others were thrown to the winds (Azelama and Agbebaku 2003; Idada 2000). This situation was brought about because the military was preoccupied with prosecution of civil war and had little education and experience in art of administration.

Though the unethical practices in Gowon administration did not result to total inefficiency and ineffectiveness in the civil service, things started a complete new dimension after the coup that overthrew Gowon in 1975, when about 11,000 bureaucrats were summarily dismissed on reasons ranging from corruption, divided loyalty, to declining productivity, without the benefit of defending themselves. While it is true that the purge brought sanity to the system by annihilating the ills that characterized the bureaucratic governance, it is also true that it brought feelings of job insecurity, disenchantment, and demoralization, lack of confidence, ineffectiveness, inefficiency, and entrenchment of social vices in the running of the state affairs because the purge led to the dismissal of the good civil servants with the bad.

As part of a program of sanitizing and improving service delivery, the Murtala regime constituted a Public Service Review Commission also known as the Udoji Commission. The Commission recommended adoption of a results-oriented management approach such as the Project Management, Management by Objectives, and Programme and Performance Budgeting System (PPBS), manpower development, open reporting system for performance evaluation, Code of Ethics, etc. While the values of all these principles in large-scale management cannot be questioned their whole-scale adoption by the public service may be problematic (Omitola 2012). This realization may explain their being jettisoned by the bureaucrats that are expected to make use of them in spite of government acceptance of this recommendation. On manpower development which includes manpower planning and training, the Commission recommended a professionalized civil service through training and retraining. However, much emphasis was not placed in the implementation that the public service is still much handicapped in terms of staff development and professionalization.

## Civil Service During the Second Republic (1979–1983)

Civil service in 1979 during the civilian administration of President Shehu Shagari witnessed the introduction of the American presidential system at the federal, state, and local government levels. Also, there was a formal recognition of the "quota" system in respect of recruitment into the civil service as enunciated in Section 14 Sub-

Sections 3 and 4 of the 1979 Constitution on the need to promote national unity, foster national loyalty, and give every citizen of Nigeria a sense of belonging. Nevertheless, in practice, it has been observed that the federal character principle is more inclined to differentiate than to integrate. Momoh is of the opinion that the federal character principle may "well impede rather than accelerate the process of national integration" (Momoh, cited in Omitola 2012, p. 81). Lastly, on changes introduced into the public service, the Code of Ethics recommended by the Udoji Review Commission was adapted in a government "Code of Conduct" to "which a person must observe and conform." This was to operate in conjunction with the Code of Conduct Bureau and a Code of Conduct Tribunal established to "regulate behaviour of public officials and check abuses in the exercise of State power on the part of public officers" (Omitola 2012, p. 81).

However, the public service would have been expected to run along the principle of presidential system. But its operation was tailored along the abandoned British parliamentary system of government. The above circumstance brought about permanent secretaries whose positions were constitutionally described and recognized as chief executives of ministries and departments. They were saddled with appointment, promotion, discipline, and development of all officers in the ministry on grade levels 01–06 accorded to them by the civil service commissions. Also, the Financial Instruments and Public Administration law provided that the permanent secretaries were the "accounting officer" of the ministries and extra-ministerial departments. The top bureaucrats operated in line with civil service ethics and norms of anonymity, neutrality, and impartiality. Nevertheless, the ministers and commissioners expected on assumption of duty that the permanent secretaries in the new dispensation of presidential system of government would see them the ministers and commissioners as the chief executives of the ministries and departments, but this was not the case. This consequently led to persistent conflicts between the permanent secretaries and the ministers/commissioners (Idada 2000).

## Civil Service (1983–1999)

December 31, 1983, military coup terminated the second democratic experiment in Nigeria. General Muhammadu Buhari who led the military administration that took over the reins of power was dissatisfied with the various developments identified earlier as afflicting the public service in the Second Republic and therefore was committed to a general overhaul of the service (Omitola 2012). The regime embarked upon a purge of the service involving the retirement or dismissal of corrupt officials and other officials adjudged guilty of one misdemeanor or other. The regime also launched a program of War Against Indiscipline (WAI) with the objective of instilling in the minds of Nigerians the noble ideals of national consciousness, mobilizing their mind, and gearing them to a sense of nationhood, patriotism, and, above all, discipline. Also, to ensure public accountability, the regime undertook of a probe of public officers at all levels of government and meted out severe punishments on culprits without due process.

Furthermore, in terms of appointment of the upper echelons of the civil service, certain innovations were introduced. For example, in the appointment of permanent secretaries, provision was made for their appointment from inside or outside the civil service. Despite all these changes, the public service failed to engender national development as a result of many vices linked with the second republic such as "greed, corruption, and indiscipline, implementation of federal character principle and lack of accountability by both politicians and bureaucrats" (Okunade 1993, p. 68). More significantly, in a bid to change the ugly trend in the civil service, the Buhari regime appointed the Dotun Phillips study team in March 1985 to look into the general organization, structure, and manners of operation of the civil service and recommend ways to improve its efficiency and effectiveness. However, Okunade asserts that the team was yet to submit its report when the regime was overthrown in a palace coup d'état led by General Ibrahim Babangida on August 27, 1985.

The Dotun Phillips's report made far-reaching recommendations which informed the 1988 civil service reform Decree No. 43 of 1988 promulgated by the Babangida Administration. The Reform removed the conflict in the area of accountability between the permanent secretary and the minister/commissioner by making minister/commissioner the chief executive and accounting officer of the ministry, replacing the permanent secretary, redesignated director general. His appointment became political as his duration of service was to be at the pleasure of the appointing government and will retire with it except if reappointed by the incoming administration. Thus, the politicization of the civil service could be traced to this period.

In order to implement its programs of reforming the civil service to cope with the challenges of development in a democratic setting, the Babangida Administration established a wide array of extra-ministerial agencies including the Directorate of Food, Roads and Rural Infrastructure (DFRRI), National Directorate of Employment (NDE), Mass Mobilization for Social Justice, Self-Reliance and Economic Recovery (MAMSER), Centre for Democratic Studies (CDS), and National Council on Interovernmental Relations.

In spite of the reform measures, the Dotun Phillips reforms were defective and dysfunctional in its implementation as the study team left unresolved some of the problems of Nigerian bureaucracy (Okunade 1993). Holistically, Babangida's civil service reform of 1988 was defective on one fundamental ground such as it was a liberal package which offers superficial solutions to fundamental problems that require radical attention (Okunade 1993). While interested in restructuring the service, the Babangida Administration created more problems for the service because the reforms offended the spirit and letter of the 1963 Constitution as amended by Decree 17 of 1974 relating to the role of civil servants in a Government Department. It stated that "where any Minister of the Federation has been charged with the responsibility for any department of government, he shall be under the supervision of a Permanent Secretary, whose office shall be an office in the Public Service of the Federation" (Omitola 2012, p. 128). But the 1988 Civil Service Reforms stated otherwise as the reforms sought to relegate the permanent secretaries, to the background. The civil servants were no longer considered part of the system during the formulation and execution of public policy. A new and parallel organ was established to implement every new policy announced by the government. This destroyed the healthy relationship between the bureaucrats and ministers built over the years and also truncated the notion of shared responsibility between the permanent secretary and the minister in the conduct of government business (Akinsanya 2006). The Office of the Head of the Civil Service of the Federation was abolished to pave way for political appointees who merely danced to the dictates of those who appointed them. Consequently, all the ills associated with the patronage system became evident as demonstrated in excessive corruption, discipline, gross inefficiency, instability, and collapse of accountability and equity. This eventually led to the total collapse of the machinery of government and mismanagement on an unprecedented scale. Thus, an attempt to find a solution to some of these problems ostensibly informed some changes made by the Abacha Administration (Omitola 2012).

The Allison Ayida Civil Service Panel of 1994 was commissioned by Abacha regime to review past public service reforms in Nigeria with a view to proffering appropriate solutions to the problems bedeviling the civil service and identified the major ills of the service which needed urgent correction to improve the dynamism, efficiency, and effectiveness of the bureaucratic governance as follows:

i. Politicization of the top pyramid of the bureaucracy
ii. Lack of fiscal accountability and integrity
iii. Continuous breakdown of discipline
iv. Virtual institutionalization of corruption at all levels and sections of the service
v. Disregard for rules and regulations
vi. Loss of direction
vii. General deterioration of efficiency and effectiveness

As a result of the Report of the Panel, the Abacha Administration modified the provisions of Decree 43 of 1988. First, the post of the director general was scrapped and that of permanent secretary reintroduced. Second, the permanent secretary, it was decided, must be a career officer appointed on the advice of the head of service and recommendation of the Federal Civil Service Commission. Third, the permanent secretary became the accounting officer and chief adviser to the minister/commissioner. In case of any disagreement with the minister, this view should be made known to the head of service. The minister retained the position as the political head and chief executive officer of the ministry. While he is no longer the accounting officer, he is responsible for general direction and control of the ministry. The office of the head of service was reintroduced. The position of the secretary to the Government of the Federation still remained a political office to be occupied by an appointee of the government of the day. The occupant is to serve as a link between the MDAs and head of state.

Rather than allow the 1988 civil service reforms stability and longtime of operation like the British Fulton Committee Report of 1966 and American Civil Service reform of 1968, General Sani Abacha terminated the reforms and reversed it to the old system that was bedeviled with conflict between the permanent secretary and the minister/commissioner. With this reversal, the operation of Nigerian civil service today is tailored along the abandoned British parliamentary system of government in an era of presidential system of government (Idada 2000).

In spite of the reforms, at the beginning of the democratic government in May 1999, the perception of the Nigerian bureaucratic governance was still in the negative light, to a degree of being characterized by "lack of commitment and vision, high presence of primordial interests such as nepotism and tribalism (an institution) where recruitments were not done according to laid-down rules; where people related to public office holders were recruited into the civil service for positions they barely or not qualified to occupy; and in the same period, "state laws, ordinances, judicial processes, and the judicial system lose their credibility and non-compliance with laws becomes commonplace" (Aiyede 2003, p. 18).

## Civil Service Reform or Governance Reform in the Fourth Republic

President Olusegun Obasanjo assumed office as the new civilian president on May 29, 1999, and unfolded his vision of an ideal public service for Nigeria with the following elements:

i. A competent, professional, development-oriented, public-spirited, and customer-friendly civil service capable of responding effectively and speedily to the needs of the society
ii. A civil service with the core values of political neutrality, impartiality, integrity, loyalty, transparency, professionalism, and accountability
iii. A civil service that is guided by equity, where things are done in the right way based on extant rules and regulations but with room for discretion, which should be exercised in the public interest
iv. Creation of a suitable environment where civil servants are assured of protection and job security in the faithful discharge of their duties and responsibilities
v. A competitive, well-remunerated, and innovative civil service

To realize a result-oriented civil service, Obasanjo embarked on far-reaching reforms such as privatization, deregulation, and outsourcing policies in Nigerian civil service. Various measures were put in place which include the establishment of anti-corruption bodies like the Economic and Financial Crimes Commission (EFCC), Independent Corrupt Practices Commission (ICPC), and Due Process Unit in the Presidency. To effect structural changes in the service, the Budget Office was separated from the Federal Ministry of Finance, while the Department of Administration and Supplies was put in charge of awarding contracts, and the Department of Finance and

Accounts was in charge of payment of contracts. This governance reform was with the aim of providing room for transparency in the handling of activities of different departments of government.

Unfortunately, all the aforementioned reforms since the beginning of the Fourth Republic to date appeared to make little or no meaningful impact on the deepening crises of ethics, accountability, transparency, and inefficiency in governance of Nigerian bureaucracy. The crises are largely attributed to wrong application of federal character in the recruitment of public bureaucrats.

## Federal Character and Politicization of the Civil Service

The Second Republic of 1979 experienced the introduction of federal character in Nigerian Constitution, as a fundamental instrument for managing Nigerian public sector.

The introduction of federal character was brought about by complaints from some parts of the country that the way positions in the public service were currently distributed had adverse implications for development, nation building, patriotism, and peace in the country (Azelama and Agbebaku 2003). To foster national unity, it was argued that there was a need to make people from various parts of the country feel recognized by the way appointments were made into the federal public service. This article argues that the inefficiency and ineffectiveness of the Nigerian civil service are partly occasioned by federal character and the failure of the political leaders to integrate federal character with meritocracy without compromising merit and efficiency. The essence of public service is to be responsive to the yearnings of the people by ensuring efficiency and effectiveness in the utilization of public resources and provision of public services. This objective could not be achieved when federal character compromises the principle of meritocracy in the appointment of senior/top bureaucrats.

Despite repeated claims that appointment into the bureaucracy is merit-driven, existing evidence obviously points to the contrary. There are concerns that the recruitment process in the Nigerian civil service is highly influenced by both the political and administrative leadership (Pepple 2013). The consequence of this phenomenon is that not only the society that loses but also the political leaders and the administrative leaders who need the services of capable officers in order to achieve the mandate of their ministries.

When the senior management of the civil service is dominated by officers other than the best and brightest in its system, ministers and permanent secretaries cannot function at their best as the capability of senior civil servants to support them in carrying out their functions would be largely impaired (Pepple 2013). This situation is worsened for the system if the incompetence is led at the top by the permanent secretary. Indeed, when permanent secretaries' appointments are on the basis of political considerations rather than by merit and competence, the likely result is that such officers are incapable of realizing the expectations of their high offices and advising impartially without fear or favor. "Their glaring incompetence may be a source of friction between a dynamic Minister who wants the job done quickly and a top bureaucrat who is incapable of providing quality advice to achieve the goals of the organization" (Pepple 2013, p. 32). Unfortunately, while ministers get fired for underperformance, a virile performance management has not been fully installed in the Nigerian bureaucracy; hence the worst punishment that a permanent secretary gets for underperformance is for him/her to be posted to another ministry. Consequently, the circle of incompetence is repeated across the bureaucratic governance system.

## Concluding Remarks

From the forgoing narrative, it is axiomatic that before independent and 1960–1966 Nigeria federal and regional civil services were replete with competent and exceedingly incorruptible top bureaucrats. Efficient bureaucracy was in

operation because the political leaders, such as the ministers, chatted and articulated a continual political leadership, guidelines, and direction for the administrators/managers to follow, by ensuring that the civil servants faithfully carry ought laid-down policies, with an emphasis on meritocracy in recruitment process. However, since 1966 till date, political leaders and bureaucrats have failed to manage and harness the strengths and potentials in the diverse population in the Nigerian bureaucracy to engender functional public service capable of addressing and meeting the needs and aspirations of the people as well as stimulating economic growth and development despite many reforms introduced to make the service result-oriented. The reforms failures are attributed to ill-informed, poor implementation, lack of political will and policies discontinuity, incompetency, lack of vision, unethical practices, cluelessness, parochialism, credibility and legitimacy crises, politicization of the Nigerian bureaucracy, inappropriate application of federal character which often compromises merit in the recruitment of bureaucrats, etc. Thus, Momoh apt description of the situation (cited in Ukiwo 2007, p. 277) is worth quoting:

> We do not have to make a poor man rich by making a rich man poor. The aim should be to make a poor man as rich as wealthy in our midst. Our politics of envy that seeks deliberately to retard the progress of those who are making sacrifices to obtain their level of development in order that the less developed can catch up will impede rather than accelerate the process of national integration and cohesion.

Therefore, in recruiting top bureaucrats such as directors and permanent secretaries, head of service emphasis should be placed on merit to enable Nigerian civil service utilize its brightest and best brains – capable of meeting the expectation of their high offices and advising the political heads or ministers impartially without fear or favor in order to enthrone a sound governance.

Lastly, transparency and accountability should be increased through whistle blower protection's policy that would help to uncover corruption and unethical practices by holding to account the political leaders and bureaucrats in Nigerian public service to ensure meaningful and sustainable development.

### Synonyms

Civil society; Community; Common wellbeing; Formal self-organization; Helping behavior; Informal assistance; Informal groups; Informal help; Informal networks; Informal social networks; Interpersonal social networks; Informal volunteering; Mutual help; Nongovernmental organizations; Noncommercial sector; NGO sector; NPO sector; People-to-people assistance; Self-organized groups; Social capital; Social context; Social networks; Social organization; Social and cultural context; Social service organizations; Third sector; Welfare government

### Definition

The term *civil society* originates from Aristotle's phrase *koinōnía politikḗ*, which has a meaning of community characterized by a shared norms and types of behavior grounded in civil law. The purpose of civil society Aristotle defines as common well-being.

### Introduction

This encyclopedia entry discusses the contested understanding of the notion of civil society on a global scale. This essay suggests differentiating the definitions of civil society in the Western and Eastern tradition. Lately, the idea of civil society was conceptualized in Western tradition as an aggregation of a plethora of charities and politically engaged nongovernmental organizations (NGOs). This encyclopedia entry argues that cultural context defines civil society institutions and suggests new conceptualization of civil society suitable for Eastern tradition. The entry discusses the distinguishing features of civil society in Russia, which can be found in many other Post-Soviet countries and, generally, in most countries of Eastern tradition.

By accounts of local and foreign experts and scholars, civil society in post-Soviet countries was conceptualized in Western tradition as an aggregation of nongovernmental organizations (NGOs) by Western school of political thought. Yet, it has not lived up to fit the ideal of Western civil society (Luong and Weinthal 2004). The encyclopedia entry argues that cultural context defines civil society institutions and suggests new conceptualization of civil society suitable for Eastern tradition. This encyclopedia entry discusses the distinguishing features of civil society in Russia, which can be found in many other countries in Eastern tradition.

Anheier (2007) argues that modern researchers often discuss global civil society as a part of an ongoing Western modernization project and, therefore, fail to take account of other civil society traditions. This leads to a stalemate in generating new knowledge and understanding of civil society in other parts of the world. The most common Western definition of civil society excludes from civil society family, state, and market and gives it a shape of a conglomerate of nongovernmental organizations (NGOs) of various orientations from garden clubs to political parties. The use of this definition leads to a logical conclusion: a country with limited nongovernmental sector has crippled civil society, and a country with no NGOs has no civil society. Edwards (2009) argues that when modern scholars reduce the meaning of civil society to the world of voluntary associations, they forget that there are earlier and later traditions that have much to offer in understanding global civil society.

This encyclopedia entry discusses the broader concept of civil society, than is the concept used by scholars in Western tradition. To define the broader concept, the encyclopedia entry uses Russian civil society as an example of an alternative model. It argues that the current definition of civil society as a political force in the midst of democratic policymaking is formulated by Western scholars in the context of modern Western political, cultural, and social agendas. The Western concept of civil society is not helpful to define civil society in non-Western cultures with different political and social contexts. The concept of civil society should be related to local context, culture, and traditions to be relevant to different countries. Otherwise, we are pushed to deal with the unhelpful dichotomy: Western "civil" society and Eastern "uncivil" society.

Putnam claims that civil society takes roots in social capital. Social capital according to Putnam (1993: 167) "refers to features of social organization, such as trust, norms, and networks that can improve the efficiency of society by facilitating coordinated actions." This definition is broad enough to apply to many countries. This encyclopedia entry proposes a more suitable definition of civil society for the countries in Eastern tradition, such as former Soviet countries and Russia. It explains how social capital and civil society is preserved in social and cultural context of post-Soviet societies. Jon Van Til (2002) suggested expanding the concept and include informal groups consisting of friends, family, and community groups as a part of civil society. This encyclopedia entry follows Van Til's suggestion.

## Government Crowding Out Effects and Russian Civil Society

The Soviet period in Russian history illustrates the theory of government crowding out effect. During the Soviet period, the socialist government was responsible for provision of basic and simultaneously vital services to citizens. The coverage by government services was universal. Thus, the government crowded out other formal assistance institutions. The shadow argument holds that in the absence of government services, millions of nonprofit organizations appeared in Western countries to provide the plethora of services to various populations to compensate for government incapacity or reluctance to serve the people and the country.

In Soviet Russia, where government provided vital services to people and their children, the need for the NGO sector was limited. Nonetheless, Soviet people self-organized informally for various cultural and social needs. Typically, such services were provided by informal social networks. In Russia, widespread of informal volunteering compensated for the absence of nongovernmental institutions and provided assistance immediately, unlike government and nongovernmental bureaucratic organizations. Although scholars discuss informal volunteering as ubiquitous, nobody keeps record of such informal assistance, and nobody refers to it as a part of civil society. People-to-people assistance is not accounted for in statistical reports or government records. However, in Soviet Russia government and informal social networks were capable of providing social protection, economic assistance, and psychological support to Russian citizens.

## The Soviet Legacy, the Role of Government, and Informal Social Networks

Three major venues for mutual help existed in Russia during the Soviet period. These are partly represented in modern post-Soviet Russia as welfare government, informal groups of mutual support, and formal nongovernmental public service organizations. Three types of assistance institution are characterized by a variety of organizational forms, goals, capacity, scope of service, and clientele. The encyclopedia entry provides a brief outlook of the differences between three institutions.

First, Soviet government in early Soviet period (since 1918) pledged to provide universal services to cover basic and most urgent needs of Soviet citizens: healthcare, education, security, and the provision of basic goods for survival. The

government took upon itself to organize and run healthcare institutions – hospitals, education – primary and secondary schools and universities, army, and militia. The provision of most needed food products and consumer goods was partly provided by traditional small business *artels* and partly through government-run agro-farms and factories. The law from 1921 has established new forms of small business – *artels*. The participation in *artel* was voluntary. The management was based on democratic principles. The *artel* members could leave the *artel* with their share (http://eclib.net/47/5.html). Government provision of goods and services was criticized for low quality. However, goods and services were provided since the first decade of Soviet power on the principle of universal access. In Soviet Union every village, school, enterprise, and an ocean ship had a doctor or a qualified nurse onboard. By contrast, Western governments provided a limited number of basic services to vulnerable populations and never made them universal.

Second, Soviet people self-organized for various reasons. One example of self-organization was "dacha cooperatives," where people organized to grow fruits and vegetables for personal consumption. These cooperatives had been partly subsidized by government. Soviet workers used to receive apartments for free from state enterprises where they worked. For the economy of scale, the apartment buildings were erected in one location. This formed communities of people who worked together, lived as neighbors, and signed up their children to the nearby schools. This helped build solidarity and team spirit among close neighbors. It was common to borrow money from neighbors, to help each other with children and elderly care, to buy groceries, and to provide other forms of support. By contrast, people in Western countries live in individualistic societies and develop different approaches for helping each other, typically through formal organizations, the NGOs.

Third, with the intensification of industrialization and the growing need for educated people, the Soviet government encouraged people to organize themselves in chess and sports clubs, air-model clubs, book-lover clubs, etc. Some of these organizations were more formal than others. Some received subsidies from government; some formed as membership organizations and financed activities through membership fees. The common purpose united people and led to selfless cooperation. When the Soviet regime weakened and was dismantled in 1991, the power of connection stayed at a personal level.

Russian people under the socialist regime developed a habit of receiving substantial social and economic assistance from the government. Therefore, even today, under neoliberal capitalist hostility to government, people habitually expect Russian government to take care of their basic economic and social needs simply because "it is right." When asked to define the term *civil society*, Russian people often include government as a part of civil society. Currently, under the influence of neoliberal economic ideology, Russian government downsized and started cutting budgets for essential public services such as healthcare, childcare, transportation, and free public housing bending to the pressure from the World Bank and IMF – the proponents of neoliberal ideology (Stiglitz 2004). Under the condition of shrinking government services, Russian people returned to traditional ties with family, neighbors, or coworkers informal networks for needed services and assistance.

The informal networks cannot substitute government services, but they became indispensable to help improving individual situations of members under the condition of diminishing state in the twenty-first century. In Russia informal social networks are typically built through face-to-face interaction. This type of highly personalized relationships is a characteristic of collectivist societies, where norms of trust and reciprocity are established in two ways: (1) through family tradition and (2) through frequent interaction between unrelated individuals. Historically, in prerevolutionary Russia (before 1917), village peasant gatherings (Skhod) played a crucial role in arranging common village meetings and helping impoverished families and individuals to survive (Kara-Murza 2011). Old tradition of Skhod transformed into informal social networks under the Soviet regime, which currently persists nowadays in the context of reduced and less effective government.

To properly delineate the contours of civil society in Russia, this encyclopedia entry refers to civil society and social capital as related terms and rejects the reductionist definition of civil society as the agglomeration of nongovernment sector organizations. The list includes benevolent welfare government, informal social networks, and formal public self-organization as constituent parts of civil society in Russia. From this inclusive cultural perspective, civil society in post-Soviet countries is seen as vibrant and ubiquitous. This view diverges from the most often used Western concept, which limits the concept of civil society to formally registered social service organizations.

## Two Sides of Russian Social Networks

Interpersonal social networks in the Soviet Union were diverse, but generally they can be grouped in two categories – supportive (positive) and corrupt (negative) networks. Ledeneva (2006) researched and reported commodity and service exchange activities of social networks on the basis of *blat*. The word *blat* originates from the criminal context with the meaning *illegal* or *corrupt*. In the period of consumer goods shortages, people with access to limited commodities had organized exclusive *blat* networks for the purpose of enrichment and services exchange. *Blat* was primarily rooted in the practice of illegal commodity trade or exchange, which started in the late Soviet era period (1970s–1990s) and achieved its pick of activity in the form of *nepotism* and *connections* in post-Soviet times. However, *blat* relationships existed on a smaller scale as compared to the ubiquitous positive social networks. Exchange relationships were utility based rather than friendship based. The participants would sell or exchange goods for services or equally valued goods. Regular Soviet citizens perceived *blat* relationships as illegal and repulsive. The motive of help and support, which characterized social networks, was absent in *blat* networks. Therefore, *blat* cannot be incorporated into the concept of civil society.

*Blat* was typically localized to large cities. Small city dwellers and villagers were not involved in this commodity exchange simply because they could sustain their basic needs by themselves and did not value fashionable trends highly. Logistically, *blat* could not develop in villages. Villages did not have large storage facilities for consumer goods, which were used by managers in the cities to secretly develop illegal exchange of goods. Philosophically, *blat* relationships were not acceptable to the majority of Soviet people for different reasons. Some viewed blat groups as criminal; others qualified it as morally repulsive. Most people viewed *blat* as an illegal social phenomenon that undermined the principles of equal access to public and private goods.

By contrast, other scholars researched the practice of positive or supportive informal social networks, where social capital of the networks was used to support family, friends, neighbors, and coworkers in times of distress and significant loss or in happy events such as weddings or a childbirth. Positive networks differed greatly from negative ones in their normative significance and societal impact. Negative or *blat* informal social networks were typically used by materialists or commodity-driven people and were characterized by fake friendships and twisted morals. Members of such networks were well aware of the fact that they acted outside of law and generally accepted norms of behavior and tried to conceal their "business" transactions.

On the other hand, members of positive social networks were motivated by the community benefit rather than by profit and acted openly. Positive informal social networks were grounded in the belief of reciprocity and common interest and were characterized by genuine lifelong friendships, unconditional trust, and loyalty. People in positive informal networks collaborated voluntarily when help was needed. A few examples of such help were babysitting, providing financial assistance (interest-free personal loans), assisting with difficult educational assignments, helping at schools with note-taking, helping and sponsoring friends for funerals and weddings, listening and consulting in times of psychological distress, assisting in family conflict resolution, standing

by a coworker in a confrontational situation with a boss, and many other instances where help was needed.

This encyclopedia entry excludes *blat* relationships from the definition of civil society simply because it was organized for personal profit, not for help. On the contrary, positive social networks benefitted everyone by opening opportunities to the members of loosely defined communities and improved economic and social outcomes for the members of the network without asking for money. Through informal interaction, people established social cohesion and created common benefits for many, which constitutes the essence of civil society.

## Utility Perception of Social Networks and Formal NGOs

Below the encyclopedia entry briefly discusses the empirical findings on how people in Russia perceive the utility of Russian government, NGOs, and social networks. Descriptive data comes from the Russian survey of 41,500 randomly selected individuals from 85 administrative districts of Russian Federation over 18 years of age. The error is within 1% (Mersianova and Korneeva 2011).

Table 1 below presents the evaluation of the usefulness of various service providers to people in difficult life situation. The table shows the preference of the respondents in choosing the assistance provider to people in need.

Responses to the first question regarding the choice of assistance providers indicate that Russian respondents highly evaluate government and family, while the usefulness of NGOs as assistance providers is much lower. Russian survey respondents were allowed to make multiple choices from the list. It explains that the total percentage of responses in Russian survey did not add up to 100%. Having had a multiple response option, the respondents in Table 1 indicated their preference for the government and family members as service providers. The respondents have chosen government agencies as expected and most likely assistance providers (69%) and have chosen friends and family as their second choice providers (55%).

**Civil Society in Post-Soviet Countries, Table 1** The value of various assistance providers to Russians

| Russian respondents | |
|---|---|
| The value of NGOs | |
| In your opinion, who should help socially vulnerable people like pensioners, disabled, families with many children, single mothers, orphans, emerging talents, and socially challenged individuals such as ex-convicts, alcoholics, drug addicts? | |
| The answers to the questions are provided in percentages | |
| 1. Government | 69% |
| 2. NGOs | 24% |
| 3. Commercial org(s) | 15% |
| 4. Family and friends | 55% |
| (The result does not sum up to 100% because respondents were allowed multiple choices) | |
| Trust in NGOs | |
| 1. In which of the following types of public associations, NGOs, and public initiatives do you trust? (the list of 26 organizations was provided to the respondents) | |
| Expressed trust | 37% |
| Expressed no trust | 63% |
| (The results above are averaged) | |

Source: The Participation of Russians in informal civil society networks and in activities of the nongovernmental organizations, Mersianova and Korneeva (2011)

Survey results suggest that Russian respondents have comparatively low level of trust in the NGOs. The answers to the question "which public associations and other NGOs do you trust?" were divided between a little over one third (37%) who expressed trust of at least some forms of associations and cooperatives and approximately two thirds (63%) of those who expressed no trust in NGOs. The analysis of responses indicated that from newly established NGOs, a comparatively high percentage of respondents have chosen "protection of consumer rights" (12%) as trustworthy and determined that other NGOs were the associations formed in Soviet days such as associations of veterans of war, trade unions, cooperatives of summer house owners, and the unions of disabled people (32%). The results of general perception of trust in NGOs in Russia suggest that most people in Russia do

not include the organizations of the nonprofit sector in their circle of trust.

The second part of the survey provided information on the composition of social networks. From all respondents to the 2011 survey, 50% confirmed receiving help from their social networks, which included family (85%), friends and acquaintances (65%), neighbors (30%), coworkers (28%), people in similar circumstances (14%), religious groups (9%), and the members of ethnic groups (3%). It is common to find family and friends among assistance providers, and it is interesting to observe a high level of involvement from neighbors and coworkers. The survey responses describe the types of services that social networks provide to respondents in Russia. Table 2 below presents the answers of the survey participants

Responses in the Table 2 suggest that the most common assistance from informal connections is giving small and large interest-free loans, household assistance, babysitting, and consultancy. Since the disintegration of the Soviet Union, the practice of mutual help did not disappear but became necessitated by diminishing government assistance.

Given the withdrawal of the state as service provider after the disintegration of Soviet Union, the nonprofit sector in Russia started growing, as measured by the number of registered NGOs from year to year. Yet the impact of the sector is minimal, although few individual NGOs have achieved recognition. These are mostly the NGOs that provide help to children and serve orphanages. The NGOs serving vulnerable populations, which are known as socially oriented NGOs, became eligible for state support, which made them more visible and increased their numbers.

## New Trends

As mentioned earlier, in Russia, the informal help is more common than formal organized help through the NGO sector organizations. Recently, informal individual volunteering has evolved into organized informal volunteering, which became a new trend in the development of volunteering in Russia. Today, the Internet provides new and many opportunities to find the cause that people care for and join the organized effort. However, these informal volunteer groups do not aspire to become bureaucratized and register as NGOs. These groups continue providing assistance until they no longer perceive the existing need. When the help is not needed, they stop volunteering. Multiple examples of informal online

**Civil Society in Post-Soviet Countries, Table 2** Types of informal assistance in Russia

| | Type of service | Percentage of respondents receiving the service |
|---|---|---|
| 1 | Small interest-free loans (till the next paycheck) | 28% |
| 2 | Household assistance (moving, repair, cooking) | 24% |
| 3 | Family assistance (groceries, cleaning, babysitting) | 19% |
| 4 | Large interest-free loans of money (to buy a house or a car) | 12% |
| 5 | Regular babysitting | 10% |
| 6 | Professional information and consultation | 10% |
| 7 | Family conflict settlement | 7% |
| 8 | Assistance finding a good doctor, transportation to a hospital, buying medication | 7% |
| 9 | Helping to prepare for school tests | 7% |
| 10 | Finding a job | 6% |

Source: Philanthropic involvement of Russians in Charitable Practices, Mersianova and Jakobson (2009)

volunteering could be found on the Facebook and Vkonakte (Russian network). The first example is the group of young bikers from a small city Krymsk in the south of Russia, which was flooded in 2014. The bikers have organized informal assistance to the inhabitants of Krymsk by delivering medication, food, and potable water to the people in need. They continued the assistance through the summer and disbanded their group as soon as the need disappeared. Another example is the group of teenagers, who helped in finding new owners for horses that were abandoned in a stable by a bankrupt owner. One more example is the group of women organized to learn traditional Russian weaving and tapestry, which exists on the website Vkonakte. Vkonakte (https://vk.com) is an Internet social network service similar to Facebook in Russia. The women meet in the leaders' house and support their activities through individual contributions and the sale of the crafts. There is a group of medical translators, who assist families with disabled or seriously ill children to translate medical documents for treatment abroad.

These groups are called "informal" or "spontaneous" volunteers. Typically, the groups of informal volunteers consist of young people, who got aggravated or excited by the story that appeared on the Internet. This informal helping behavior is the result of empathy. Participants of unstructured informal helping groups may become institutionalized volunteers when they obtain positive volunteering experience. Informal volunteering is exciting to young people because it provides the opportunity to help people, nature, or animals as a way to contribute to societal well-being. Research shows that the members of the informal groups are inspired by the cause, have strong task-oriented motivation, and have individualist values. These groups more often consist of younger volunteers, because the Internet is the place where they communicate, exchange views, and express concerns about their personal and public life in Russia.

None of the groups discussed above register with the Ministry of Economic Development of Russian Federation as formal nongovernmental organizations. Hypothetically, two factors divert otherwise philanthropic individuals from working with the NGOs – (a) bureaucratic structure of NGOs and (b) the lack of trust in NGOs.

Russians have a long history of philanthropy and volunteering. School children learn about famous "do-gooders" from prerevolutionary times including the Russian Tsar family to modern times of socialist public organizations and to post-modern Russian charity foundations and several high-profile NGOs. Before Soviet era, philanthropy was routinely considered the business of wealthy married women, who devoted their free time and excessive family income to help the disadvantaged for religious reasons. After the socialist revolution in 1917, the new government took upon itself the organization of welfare and care for disadvantaged, organization of sports, and trade unions. The need for the non-governmental sector in Soviet Russia was not obvious, as the encyclopedia entry discussed earlier.

In 1991, after the disintegration of the Soviet Union, Western donors perceived a void in social life of Russians and started supporting new non-government sector through organizing, training staff, and funding nonprofit organizations. After the "capitalist revolution" in the 1991, many educated people were looking for jobs and found the opportunity in the NGO sector. At the time, teachers' salaries were below the poverty level, while inflation was higher than 2000%. Some of the underpaid people turned into new social entrepreneurs by seeing the opportunity to find jobs in the NGO sector and to receive support from foreign donors. Several new businesses also saw the opportunities to use nonprofit sector organizations as tax shelters. Others were purposely created as cover-ups for illegal activities. The stories were publicized by the media. As a result, many people were turned away from the NGO sector because they did not believe into the ingenuity of new nongovernmental institutions, which were paid by businesses or by foreign governments. The level of trust to newly organized NGOs was low. The enthusiastic grant providers damaged the NGO sector in its infancy by pushing too hard without understanding the culture and the context of the country. Research confirms that Russians today continue relying on social networks rather

than on the NGO sector for help. The strategy to develop new NGO sector proved again that one size does not fit all.

## Conclusion and Discussion

To understand social choices of Russian society, the essay took historical and cultural perspective. This essay discussed the different modes of organization and assistance provision in Russia as compared to Western societies. This encyclopedia entry underscored the importance of understanding the culture and historical context of Russia, which was illustrated by the data from the representative survey in Russia.

Hofstede's theory of individualism/collectivism (2000) describes Russia as a collectivist society. People in collectivist societies develop personalized trust. Often they do not understand the motives of NGOs, which they perceive as bureaucratic organizations with rules and hierarchy. In modern Russia, a lack of understanding translates into a lack of trust. In the future, NGOs will establish positive reputation and will find the way into the hearts of general Russian public and will incorporate into Russian civil society. After 20 years of massive import and financial support of the institutions from the nongovernmental sector by Western governments and nongovernmental donors, the NGO sector is still unrecognized and underestimated by the majority of Russians. At the same time, Russian civil society is still vibrant and effective, with reduced government support and a comparatively weak NGO sector.

The discussed variations of self-organization illustrate somewhat similar and dissimilar paths that Russians take to organize their lives and assistance to others. Their help arrangements are often informal and come from family, friends, neighbors, and coworkers. The fact that assistance comes not from formally organized and registered NGOs does not change the essence of Russian civil society: people self-organize and help one another. The society is civil when it unites people, teaches personal responsibility for the well-being of others, and builds cohesion.

Informal networks facilitate the delivery of essential services to Russians and help establish immense social capital in Russia. Following Putnam's definition, such relationships represent reciprocity and trust among family and friends. Informal and personalized social networks and related social capital help people improve their individual situations and establish the feeling of belonging. Yet, trust in and reliance on public associations and NGOs stays low in Russia. Low trust in NGOs in combination with high trust of inner circles of family/friends/neighbors/coworkers defines civil society in Russia, as well as in many other countries that live outside Western cultural and social tradition.

Western and Eastern models of public organization are strikingly different. The difference impacts the scope and the size of the NGO sectors. In the USA, the long period of limited government, activist church, and self-governance have produced the institution of nongovernmental assistance through the formally registered NGOs to provide services to people before the government took an active role in society. With limited government assistance, in the West, people rely upon themselves or register formal NGOs to attract donations. NGOs tend to formalize assistance for the accountability purpose and build close ties with donors to secure trust and funding. The need for funding and accountability makes formal organizations bureaucratized, which formalizes the relationships with their clients.

Under the pressure of lending global economic institutions, the Russian government started cutting expenditures on social services. During the 25 years of transition period from 1991 to 2016, Russian government closed subsidized day care centers, reduced subsidizing medication, halved the number of doctors and hospitals, cut funding for higher education, and reduced pensions to subsistence level. Regardless, in line with the path dependence tendency, Russians do not see an alternative to government-provided reliable public services. In the meanwhile, the importance of social networks increased. Mutual helping networks and experience of personalized support are derived from hundreds of years of tradition. Because of close ties, frequent interaction

between family and neighbors, it is impossible to cheat community members or steal borrowed money.

## Depersonalized Bureaucracy of NGOs and Unclear Motives

Western reformers of the socialist world suggested the remedy that proved effective in their home countries. To replace government services, Western donors started supporting the import of the nonprofit sector to Russia from the USA and Europe through massive funding and grants. Contrary to donors' expectations, this endeavor was doomed from the beginning. The motives of the newcomers were neither clear nor credible to Russian citizens. Western donors turned to funding the local breed of the nongovernmental organizations. Their efforts brought only limited success. New NGOs were perceived as formalized bureaucracies with unknown motives. As a result, Russian people developed a low trust of these unfamiliar and depersonalized Western institutions.

Two other factors contributed to low levels of trust for NGOs in Russia: an opportunistic behavior of some NGO leaders who wanted money in the first place and the accusations of illegal activities of newly established NGOs. In the early 1990s, mass media publicized quite a few economic and political scandals about newly established NGOs in Russia. NGOs were accused for working as tax shelters for the *nouvaux riches*, for being the hub of political agenda, and for hunting grants from foreign donors to help their business in Russia. As a result, general perception of hidden self-serving agenda of some NGOs has damaged the reputation of the whole sector.

In Russia, the process of formation and funding of new NGOs is not fully open and transparent, which raises questions of the potential donors and the general public. More importantly, people in Russia cannot establish personal relationships with these service bureaucracies. Having no frame of reference, people in Russia do not understand the true goals of NGOs. Under the circumstances of declining government support, and the suspicious rent-seeking and self-serving goals of NGOs, people in Russia returned to the reliable informal networks of friends, neighbors, family, coworkers, and community members for service and support.

This encyclopedia entry suggests that the charitable institutions were not able to build a framework of trust in Russia. Instead, people continued relying for a limited assistance from government and from informal social networks, which they perceived as reliable and trustworthy. However, given the capacity limitations of informal social networks, there is a growing need for bigger and better funded public service organizations for the provision of assistance to vulnerable groups. The NGO sector in Russia is growing. Since 2012, government started providing regular funding for socially oriented NGOs, which provided services to vulnerable populations. Many Russian NGOs offer useful services to children, to pensioners, and to disabled people. These NGOs achieved higher level of credibility by addressing the problems of the people with the highest need. However, to rehabilitate the sector reputation, the NGO sector organizations need to develop more participatory organizational culture, involve more volunteers, and become fully open to public scrutiny. The NGOs in Russia also need rethinking their methods to reach the people and gain their trust.

Today, government continues to be the number one institution for assistance in Russia even in the face of diminishing fiscal capacity and vanishing political will. To stimulate government to provide better services, people need to make their voices heard. This can be achieved through the widening participation of citizens in political life, something that most people detest. The collectivist traditions of frequent face-to-face interaction might be the clue to achieving success for the voluntary sector in Russia. For clients, NGOs need to be less formal and to adopt practice that characterize the relationships of close friends and neighbors and to be open and transparent to the general public.

# Civil Society Organizations

Yu Ishida
School of Project Design, Miyagi University, Taiwa, Japan

## Synonyms

Civic associations; Non-profit and non-governmental organizations; Voluntary organizations

## Definition

The term "civil society organizations" can be defined as a wide range of organizations that seek and maintain civic and public life in general by members consisting of citizens, volunteers, unpaid staff, and paid staff. The organizations play the role through service providing, disclosure and spread of information, and advocacy, watch governments, and aid people outside. Depending on the local and global societal context with long history, the organizations such as volunteer groups, neighborhood associations, community-based organizations, mutual associations, nonprofit organizations, nongovernmental organizations, labor unions, indigenous groups, faith-based and religious organizations, professional associations, foundations, and public benefit institutions have been contributing the civil societies.

## Introduction

People must seize a part of "civil society organizations" (CSOs) by intuition if they are told examples or cases. Even so, it is very difficult to explain what the civil society organizations are. This is because those examples and cases have to be brought from a very wide array of fields and areas as well as they are not only emerging social players in many parts of the contemporary world, but also they may have historical origins of the activities and settle people's lives in deep. In addition, they are different composition in each country. That is, the definition of "civil society organizations" can vary based on culture, history, and country context.

To define "civil society organizations," it is effective to illustrate practices, circumstances, and academic discussions together. Frankly speaking, every single citizen has associated with the CSOs directly or at least indirectly. The practices of many organizations are affected by the social movements such as aging society, poverty, disasters, and democratization campaigns as well as political trends including institutional changes, economic policy, contracts and funding, and collaboration. These practices and circumstances of the CSOs have been discussed in the various academic fields such as politics, economics, sociology, and history.

In a little more specific, World Bank (2013) describes the CSOs as a wide of array of organizations such as community groups,

nongovernmental organizations (NGOs), labor unions, indigenous groups, charitable organizations, faith-based organizations, professional associations, and foundations in order to cope with public life, expressing the interests and values of their members or others, based on ethical, cultural, political, scientific, religious, or philanthropic considerations from a viewpoint of its practices in partnership. Types of organizations and genres of issues are not one-to-one match. A variety of types of organizations, and even other sectors such as business and governments, have worked on the same social problems and competed to deliver the same kind of services. In particular, Western trends on the government stance on public management have opened the space for the private sector to tackle these matters more than ever before as voluntary provision of public goods, not with tax revenue, or as social business.

From other perspective of globalization, making progress such as the mobility of people, diffusion of ideas, and spread of information especially through the Internet leads an expansion of fields of activities for the CSOs to intervene the social problems outside their own communities, even countries. In that sense, the global citizenship in people's mind-set is raised. By a natural process of it, more people and CSOs aim to participate in the activities to overcome the social problems such as preserving environment, getting rid of poverty, promoting social inclusion, and respecting human rights.

At the same time, an aspect of localization promotes activities of the CSOs, and they may have chances to be put in good condition. To pursue local identity needs local participation in the activities. Localization, for instance, decentralization of the government, will allocate more money to local governments as well as authorities to make decision and provision of services for local management. These kinds of movements tend to result in collaboration or go into partnership with the CSOs due to the limit of capability and feasibility of the local governments to provide and deliver all kinds of public goods.

On the other hand, various academic approaches on civil society claim different definition and level of range of organizations. The array of organizations covered above, or included in this section, is more likely to allow a wider range of organizations corresponding to the contemporary worlds. Some approaches define the CSOs in the narrowest sense, which exclude mutual association, for example, because of not enough benefit for public.

From the communitarian standpoint, the CSOs, or nonprofit organizations, make people connected to form a foundation of their communities. The state of community and civil society has been argued regardless of the times, and it is the subject of much debate from an angle of social capital theory with a tidal current (de Tocqueville 1835; Putnam 1993). It also expresses that the CSOs play a role of a generator of social capital to network people and connect them with local societies. The CSOs improve participation and civil values through monitoring the government, practicing education and research, and advocating for civil society in order to have a power to influence the public policy (Boris and Steuerle 1999). The CSOs practice the same way for private enterprises to affect their awareness and behaviors with drawing civic attentions. In a politics point of view, diversified values and interests to form civil society are declared through the represented organizations for them in a pluralistic political system. In this sense, the CSOs could function as "commons" to attain civic participation (Lohmann 1992).

In a broad sense, the CSOs with the general public play a significant role of the power to shape their societies through the vehicle of their daily participation in voluntary associations and communities including religious worship, unions, and any groups to support their civil lives (Edwards 2014).

## Social Contexts to Capture the CSOs

### Shift of Values and Roles of the CSOs

Discussion about CSOs has been continued since ancient times such as the polis debated by Aristotle and others regarding how to rule righteous duties and be ruled in the society. In this era, the

civil society and state were not considered as different sectors, but much more closely related or even players in one sector. A bundle of civic associations could be regarded the civil society.

Some nations own their history to deal with the separation of religion and politics in the trend of governance. Currently, religious churches, temples, and other religious organizations and corporations are permitted characteristics of public benefit, which are shown as tax exemptions. What is different from other CSOs is that the religious organizations and corporations do not have to turn the report in the authorities.

In relation to our contemporary world, it is quite beneficial to focus on what kinds of consultations have occurred around the last 100 years. Civil society has been taken up primarily in the exploration of the communism and democracy opening. Regarding these international issues, nongovernmental organizations have emerged and played an active part in the advocacy for peace, aid for the societies in the developing nations, especially in the insecure condition of the world as well as relief in times of disasters.

CSOs have been mediating arguments over people's values on various issues such as religious and artistic beliefs, obligations, and rights through lobbying and a signature-collecting campaign against the political system or taking the issues up even in advance of dialogues in the political systems (Boris and Steuerle 1999). They include, for instance, abortion, smoking and health, guns and security, environment and economic development, corporate ethics, animal protection, gender and race discrimination, LGBT, as well as human rights. In sum, the CSOs may promote social changes with getting the political reactions.

The CSOs are required to conduct fundraising to exploit potential donors and keep donors in touch with their organizations in order to play their role of implementing their activities regarding the arguments of the significant social issues above that strengthen the civil society. On the other hand, the donors are required to understand the value that the CSOs, or civil society, play a role of an amplifier of people's voices (CIVICUS, website).

Besides these relations between international affairs and nongovernmental organizations, and advocacy-oriented activities, a wide range of the CSOs act as players to deliver goods and services in their own local societies in order to improve the civil lives. It means that the CSOs are the providers of goods and services abreast of the governments and private enterprises. In this sense, the CSOs would compete to provide or sell their goods and services with these players in other sectors in the same market.

In much more market-oriented discussion, it tends to use the word "nonprofit organizations," or NPOs. It is pointed out in the consultations why they coexist with the for-profit organizations that the NPOs, which entities are included in the CSOs in this chapter, are more trustable compared to the private firms because it often causes the information asymmetry problem between the firms and consumers. It is not easy for the consumers to get enough information from the private companies who do not want to open all kinds of information such as materials, processes, costs, and other manufacturing secrets. In addition, the law for the NPOs that prohibits to distribute profits or a surplus fund to the managements, which are called the "non-distribution constraint," gives the legitimate status to be trusted (Hansmann 1980). The NPOs also do not have shareholders like the joint-stock companies. These reasons, then, contribute to the condition that people come to highly trust the NPOs, or the CSOs, rather than the private enterprises.

In a perspective of the public goods and services provisions, the CSOs implement their activities abreast of the governments and local administration authorities. Why then are they existed besides the powerful entities? The CSOs would be able to do things more quickly and more effectively. The governments and local authorities usually take their time to check their measures of moving forward or reacting the social issues with their keeping lines of equality and impartiality. The same thing happens in the assistance and relief for the developing nations against the ones conducted by the United Nations and the national-level measurements.

## Public Support and Partnerships

Indeed, both situations for the CSOs coexisting with the private companies and the governments are seen in most of the world. The CSOs, however, often face difficult conditions to survive and continue to provision their goods and services. Simply, the CSOs from a point of view of the not-for-profit organizations do have their own social missions to improve civil society or of change-seeking. Theoretically, the CSOs provide the goods and services to the people or communities who are in need or poor circumstances and who are not able to acquire the goods and services that they need to have to keep their quality of lives from the private enterprises that primarily seek profits due to the responsibilities toward the shareholders who expect a dividend.

The other part, coexisting with the governments, is also challenging for the CSOs to keep running their programs even though they would be able to react to social needs quicker and more effectively than the government. The governments could have the revenues by levying social insurances and issuing bonds as well as collecting taxes by the policies to deliver the public goods and services based on the results of citizens' voting. The CSOs, however, provide the "public" goods and services by using their fundraising money from the general public, not a fund from those means of authorities. They ask of donations, membership fees, and grants from citizens and enterprises besides getting program revenue. In addition, they may have opportunities to get funds from the governments. The funds could be the subsidies, grants, or contracted revenues.

In sum, the CSOs are indeed needed for a part of constructing and maintaining the civil society, but it may be difficult to continue the provisioning of goods and services to support people's civil lives because they often focus on issues regarding the needy and poor. Thus, the CSOs must find sources to fill a shortage or a lack of the budget to be able to implement their activities. The sources they usually look for are supports from the general public, private enterprises, and governments.

The targets are clearly scoped, and the CSOs may get funds through membership fees, charitable giving, grants, and subsidy. From a point of view of the donors and providers of funds, they consider these money as the sources for something worth for the society, not the money just given away for free. It means that they choose which organizations, or even what programs, to give or contribute their money.

The donors are also looking for incentives they could get. They may have tax exemption applications if they give to the eligible organizations permitted by the authority. There are so many CSOs, but some organizations do not have enough characteristics regarding "public interest" when the broad definition of the CSOs is adopted. Mutual associations, for instance, do provide goods and services only to the members inside the associations, that is, their activities do not affect the public.

It needs to clarify who has the feature of public interest and who does not have to determine who may get eligibility to apply the tax exemption for donations. The authority or someone may not decide who is good enough and who is not to designate the organizations applicable of tax deduction. Thus, it is often introduced as the "public support test." This test describes the public interest by an index of how many and how much people support each CSO because of the values of their provisioning. The equation is prepared to be able to calculate, but it depends on the stance of each country.

After the fund providers including the donors contribute to the ones carefully, they may request the feedback how the money was used and what outcomes have been achieved or foreseen. Additionally, they also wish to ask the CSOs something they think of for the better civil society. In particular, the donors and funders who contribute a substantial amount of money often give a big impact on the policies and practices of the CSOs, which is one of the topics in terms of nonprofit management and strategies. Thus, the CSOs take a way to open their activities and financial statement to the public in order to show the responsibility to use the money they received from the donors and funders. Accountability and transparency are also the parts of listed issues on management.

Another way to get funds besides the contribution is collaborations and partnerships with the governments and even with the United Nations. A number of contract-based programs to deliver the public goods and services have increased. In this background, there have been big debates regarding the size of the governments. In short, a Western trend of a notion of the public management, or "new public management," was claimed with promoting the reformation of public finance and has spread to many countries. At the first place, it was a chance for the CSOs to get funds to provide their programs under the authorities. It, however, was not easy for them because the estimation of costs by the governments often gave a lower number than the practitioners expected. Its situation has been improving by the dialogues between the CSO sector and the government such as making the full-cost recovery estimation. To some extent, the CSOs acquire stable money to play their role to improve civil life.

On the other side, it claims that more CSOs are depending on the governments and owing to lose or drift their missions in this unavoidable circumstance. Smaller organizations tend to show higher rate regarding a share of the revenue from the governments in their current revenues. It also has the same situations in crises like that the Japanese CSOs have been experiencing after the 3.11 earthquake and tsunami disaster in 2011.

One more way to get fund is collaborations and partnerships with the private companies. The companies have been required to be corporate citizen, and they were contributing money and workforce of staff to their communities. Its trend, however, changed after the corporate social responsibility (CSR) has bloomed in the sector of private enterprises. This trend was also produced in Western countries, and the CSOs, mainly the international NGOs, advocate in relation to environmental protections, human rights, compliances, due diligence, and so forth, based on social problems among the developing countries and developed countries. The CSOs in Asian countries are also looking for the collaborations regarding the CSR at the same time the business enterprises aim to seek partnerships with the CSOs (Hasan forthcoming). The CSR movement has converted stances of the companies into taking more visually appealed strategies such as contribution to the global-scaled or consumer-attracted CSO activities. It aims to seek profits after all. Then, some local-oriented or local welfare-based CSOs lost their funds from the locally located enterprises.

Lastly, the CSOs are more likely to seek the commercial revenue in recent years, which refers to details later in this chapter. In other words, the CSOs aim to do some businesses in exchange for, to some extent, relinquishing the charitable donations that indicate public support. At the same time, the CSOs may lose legitimate position to be trusted and make the border vague against the private for-profit firms.

## A Size and Dimensions of the CSO Sector

As described above, it is quite difficult to define the CSOs by checking what types of organizations are in and what are out. Still, it is highly requested to grasp a size of the CSO sector in order to understand the current status in terms of the economic impacts, labor markets, and philanthropic foundations. Thus, a number of researchers have worked on investigations to catch sight of overview of the world, starting from clarifying the extent to make clear figures, and compare the status among nations including both the developed countries and developing countries.

National accounts are the social accounting methods to measure a size of economic activity of a nation. The United Nations Statistical Commission and the Johns Hopkins University Civil Society Center with other statistical experts have cooperated to create the national accounts to extract figures as the satellite accounts on nonprofit institutions to illustrate a reliable and realistic state (United Nations 2003). In addition, these accounts include estimated figures of the value of the volunteers.

Another project that the Johns Hopkins Comparative Nonprofit Project implemented is to investigate the dimensions of a size of workforce of the civil society sector. Its project looks at the paid staff and volunteer workforce by fields of

activities as well as who supports the CSOs to see a share of public sector, private giving, and fees. It estimates "full-time equivalent" (FTE) to grasp workforce of the civil society sector in total. Figure 1 illustrates how big the CSO sector is in each country from a point of view of the employment and the fields of activities such as the culture, education, health, and so forth.

The data sources of each country have own methodology to make statistics, but to a certain extent, it describes pictures of the sector and conditions to compare with. There are, indeed, other data that should be included. They are, however, pretty difficult to grasp because of no official statistics or no obvious definition to take surveys. Community or neighborhood associations could be the one not to be able to count, but they still have a big influence to the society if it is estimated as shadow price in the social market.

Looking at a time series of the state of the CSO sector, for instance, regarding international affairs, it has been expanded in not just only a

**Civil Society Organizations, Fig. 1** Workforce of the CSO sector accounted by FTE. (Source: Salamon et al. 2004)

size but also capabilities over the past two decades in many countries. This upward trend, in particular for the international NGOs, is assisted by the process of globalization, expansion of democratic governance, advancement of telecommunications, and promotion of economic integration. According to the *Yearbook of International Organizations* published by the Union of International Associations, the number of international NGOs was reported to have increased from 6,000 in 1990 to more than 68,000 in 2016. In the field of global development assistance, the Organization for Economic Cooperation and Development (OECD) shows that the CSOs produced approximately US$15 billion in international assistance as of 2006.

Regarding dimensions of the CSOs, the CIVICUS, an international alliance missioned to strengthen citizen action and civil society around the world, proposes four dimensions to assess the civil society as the classic Civil Society Index and composed of the following: the "structure" of civil society, the "external environment" in which civil society exists and functions, the "values" practiced and promoted in the civil society arena, and the "impact" of activities pursued by civil society actors. In addition, it covers more than 75 countries (CIVICUS, website). Figure 2 describes how their index varies across the countries.

Not just the CSOs regarding international affairs have increased in a size but also the CSOs in relation to social services in the region or community are increasing.

The Johns Hopkins Global Civil Society Index has suggested another measuring rod to assess dimensions of the civil society sector at the country level. It measures three dimensions which consist of multiple indicators for each dimension. The dimensions are the "capacity," "sustainability," and "impact." Both indices have a common goal to highlight weakness of the country's civil society, to raise public awareness of the role of CSOs, and to assess the effectiveness to make civil society stronger to preserve and improve civil life. Having conversations using these assessments, people may understand that the CSOs play the significant roles and may hope them as the solution to tackle civil society issues.

## Recent Trends: Social Enterprise and ICT Usage

"Social enterprise" is one of the considerable debates in the civil society issues. In short, a part of the CSOs acquire more commercial revenue by developing and provisioning market-oriented goods and services with solving the social problems. A shine side of this trend is that they have more stable income and would be able to avoid risks to lose social support type money such as the donation, grant, and subsidy by policies of the external institutions which have been issues for the CSOs to survive.

On the other hand, even though they solve the social issues more than they do business, the more they would lose the nature of nonprofits and make the boundary unclear, which is an issue, however, not really new (Weisbrod 1998). In other words, it indicates that this type of organization overlaps between the civil society and the market and is supported by the funds such as venture philanthropy and social impact investing.

Interesting aspect of their management is hybridity. They earn money from their commercial activities, but they get charitable contributions, grants, and subsidies from individuals, corporations, and governments as well. They also mobilize volunteers besides paid staff to achieve their primarily targeting social-oriented missions. In sum, they have good-enough social missions to persuade citizens to raise funds and mobilize volunteering, while they use the for-profit business models and strategies to be able to compete with private corporations in the same marketplace.

From a point of view of finance, social impact bond and investment is the source of money that come from private investors and utilized in developed countries in recent years. This type of investment is still implemented for profit seeking (but usually a smaller amount of benefit), by the business side, while they aim to invest the CSOs or their programs in order to solve the social problems. Therefore, the CSO sector side uses business strategies to solve the problems, and the business side invests in order to contribute to overcome issues in the societies. Furthermore,

**Civil Society Organizations, Fig. 2** Comparisons of the dimensions of the civil society. (Source: CIVICUS (website))

the social enterprises, or social business, and social impact investment are considered as hopeful measures to produce the program continuity and innovation along with sociality.

Another new tool for the CSOs is the information and communication technology (ICT). During the last three decades, the number of ICT use has steadily increased. Moreover, in recent years, in particular the last decade, social media, or the social network service (SNS) including the Facebook and Twitter, has spread rapidly in our lives. This tool is also available for the CSOs.

They can use the SNS to disclose and report their activities and notify their events to raise attentions of not just their clients but also potential donors. It indicates that the usage of the Internet can form a part of the foundation of the CSOs or CSO sector.

One of the merits to use the social media is that it has a character of mutual interactions along with spreading their message quickly and widely. Many CSOs possess their home pages on the Internet and deliver newsletters, and they provide one-way actions. The social media has a great character of the two-way or interactive communications. Another merit to use the social media is that it basically costs free except for the utilization of human resource as well as is easy to use. With a combination of these merits, the CSOs can easily know the reactions of the general public toward the activities, programs, and operations of organizations in quick and direct voices by getting, for instance, "likes" and comments and for free.

Further, the social media can be a good tool for fundraising (Okada et al. 2017). Usually, it is quite an expense to implement the fundraising. It needs staff to ask for donation to potential donors as well as members and even frequent donors. It needs staff to explore the private companies to ask of contributions or grants to get their supports. These fundraising activities need a certain amount of human resource and time. Many organizations other than larger organizations, however, do not have enough resource including staff and money to spend on it. Thus, the social media can be expected as a quite hopeful and useful measure to raise funds for the smaller organizations to access so many people and institutions and far distanced entities that are not easy to reach by the traditional approach such as door-to-door solicitation and direct mails.

## Conclusion

The term "civil society organizations" (CSOs) can be defined as a wide range of organizations that seek and maintain civic and public life in general by members consisting of citizens, volunteers, unpaid staff, and paid staff. They play the role through service providing, disclosure and spread of information, and advocacy, watching governments, and aiding people outside. Depending on the local and global societal context with long history, the organizations such as volunteer groups, neighborhood associations, community-based organizations, mutual associations, nonprofit organizations, nongovernmental organizations, labor unions, indigenous groups, faith-based and religious organizations, professional associations, foundations, and public benefit institutions have been contributing the civil societies.

The CSOs are social mission-oriented organizations and practice their own activities and programs to achieve better civil life everywhere whether people do realize deeply or not. Their operation is not always stable due to the nature of organizations that have difficulties to get funds. Therefore, they access various directions to raise money such as individual charitable giving, corporate contributions, governmental subsidies, and even social impact investment as well as develop their own commercial programs.

From another perspective, the CSOs have deep relations with the general public, private companies, and governments in not only money but also policy setting. Sometimes governments change their decisions, and it affects to input more funds to the CSO sector, but in other times, they retreat from the deep relations with the CSO sector and withdraw money in that market. In sum, the CSOs need to look for more general public support. In other words, it is required to have the understanding of their raison d'être in the societies.

The activities of CSOs cover almost all of our lives. Some CSOs can be service-oriented associations, and others can be change-seeking organizations. The latter type of organizations aim to have stronger connections of solidarity and support to make change happen. The change-seeking CSOs significantly engage in advocating voices, working toward policy change, exercising accountability over authorities, and defending human rights (CIVICUS website). Thus, the CSOs can be social engines to produce the right state of the society as well as innovate new lifestyles.

It may be a discussion if the mutual associations who are provisioning services only to their members can include the CSOs. It is, however, just about an issue in relation to a size or range of commons. To some extent, a number of CSOs possess public interest and are recognized in the societies. The smaller organizations still need to look for basic funds to survive and provide their mission-oriented services and activities. Then, they may want to use the social media as a start-up tool and may try to get impact investment. When the organization comes to be enough economic activities in size, they can be target of taxations, and the public requires various documents to turn in their authorities. On the other hand, they may get tax exemption as well as the donors get tax deduction on charitable giving since they are very important to be in the societies and built the civil society.

# Civil Society Organizations in Municipal Development Strategies

Muamer Bezdrob and Daut Bajramović
Faculty of Economics, Sarajevo, American University in Bosnia and Herzegovina, Sarajevo, Bosnia and Herzegovina

## Synonyms

Citizen Participation; Decision-making; Municipalities

## Definitions

**Civil Society Organizations (CSO)** are formal groups of citizens, which by acting between citizens, economy, and state, advocate for specific civic agendas. Since CSOs mainly engage in local communities, their participation tend to enhance and complement local representative system and increase participatory decision-making.

**Municipal development strategies** refer to those ideas and practices that are formulated to promote and advance development of public administration structures, processes, and institutions at the local level according to the specific goals and values of stakeholders.

## Introduction

The main purpose of citizen participation in government's decision-making process is to strengthen democratic processes and, thus, provide substantial improvements to peoples' lives. Participation of citizens and other social stakeholders in government affairs improves democratic capacity of the decision-making processes and facilitates meeting citizens' demands. At the local government level, citizen participation is even more relevant due to the proximity of this form of government to citizens.

Civil Society Organizations (CSO) are formal groups, which by acting between citizens, economy, and state, advocate for specific civic agendas. Since CSOs mainly engage in specific local communities, their participation at the municipal level tends to enhance and complement local representative system and increase participatory decision-making. Over the years, CSOs have contributed to strengthening and formalizing citizens' participation in the local government processes mainly by facilitating interaction with citizens, and bringing in necessary expertise and experience.

Strategic planning has often been used in the public sector, since public organizations cannot manage results in long or short term without well-developed capacity for strategic management. The strategic planning process at the municipality level is particularly suitable for a wide CSOs' engagement and participation in local public administration affairs.

Municipalities in Bosnia and Herzegovina have been applying the strategic planning methodology for a number of years. This process, initiated in the early 2000s, was designed to increase the transparency, inclusiveness, social accountability, and sustainability of municipal decision-making processes. Strong participation of CSOs in the process of development strategy formulation aims to ensure the creation of a joint development vision and an increase in the strategy acceptance level by the broad community.

Bearing in mind all the benefits that citizen participation in policy- and decision-making processes brings, this entry explores the circumstances and possible factors that contribute to CSOs' significance in the process of formulation of development strategies at the municipal level in the Federation of Bosnia and Herzegovina.

C

## CSOs and Strategic Planning Process

### Strategic Planning in Local Government Setting

Strategic planning in a municipal setting prescribes a systematic process, which enables a community leadership to understand numerous environmental facets that the community will face in the future. In addition, it establishes consensus on how to achieve the most desired vision, and illuminate actions that will most likely make that happen, all within the context of expected financial and human resources (Gordon 2005).

In the United States of America, strategic planning at the municipal level has been in use for more than 20 years (Bryson 2010) and has been characterized by multiple success factors – local promotion of the process, the importance of starting the process with strategic thinking, and the importance of the environmental scan as an application of collective wisdom of participants in describing the future as clearly and comprehensively as possible (Gordon 2005).

Research on the success of strategy implementation in 150 organizations in public sector in Canada has found that a planned and formal approach to a strategy enhances its implementation in bureaucratic public organizations. Moreover, it was recognized that formal planning has an indirect effect on strategy implementation due to the mediating role of managerial involvement and that public organizations can reap benefits from formal strategic planning in less stable and unstable environments (Elbanna et al. 2016).

### Participation of CSOs in Strategic Planning at Municipal Level

CSOs aggregate citizens' interests and act as mediators in the state-society relations by communicating societal preferences to policy-makers. In a weak political context, participation of CSOs

in the decision-making process can improve the efficiency of government's services and help them connect with grassroots. The participation and contribution of nongovernmental organizations that regularly employ staff is more relevant to the political and democratic rather than economic development of a society. Having in mind that local development strategies focus not only on economic development but also combine social, spatial, and environmental development, the participation of nongovernmental organizations, and other CSOs should bring benefits to the process (Treib et al. 2007).

The question of who should be involved in policymaking and implementation is a central question in public policy and public management. Civic participation contributes to policy implementation when state actors frequently include CSOs in the policy-making process. Readiness of governments to act in a participative manner is probably the key precondition for the participation of citizens and CSOs in decision-making processes. The governments must want to seek participation as much as the participants want to give it, and citizens are less likely to participate if the political environment is not positive and acceptive of input.

## CSOs in the FBiH and Their Participation in the Strategic Planning Processes

In BiH, CSOs or associations (the official term) get registered either at state, entity, or cantonal levels, which is regulated by the Law on Associations and Foundations of BiH. CSOs in BiH mostly focus on meeting demands of their members and less on acting for public good. A study on participation of CSOs in the process of development strategies formulation at the municipal level in the Central Bosnia Canton (CBC) in the FBiH has shown that only about a third of surveyed CSOs have participated in the process. This is to an extent reflected in the perception of CSOs by BiH citizens and of their ability to resolve issues of common concern. Namely, it was detected that 70.3% of citizens of BiH do not see CSOs as being in a position to resolve local issues (Puhalo and Vukojević 2015).

Over the last 15 years, many municipalities in Bosnia and Herzegovina have initiated and established mechanisms for the formulation of municipal development strategies. In those endeavors, municipalities have been supported and assisted by different organizations and agencies. These organizations have advocated for integrated development planning, or planning based on respect for human rights, which rely on the premise that proper local municipal development planning includes a strong citizens' participation component. The purpose of development strategies formulation, as the municipalities have seen it, has been the creation of an environment for development planning by relying on local capacities and resources.

In March 2017, the FBiH Parliament adopted the Law on Planning and Management of Development in the Federation BiH. The purpose of this law is to establish a system for development planning and management of development at the level of the FBiH, cantons, and municipalities. Pursuant to this law, municipalities are obliged to formulate their development strategies, participate in the formulation of strategic documents at the cantonal level, ensure a harmonized approach to local budget planning, and coordinate the process of monitoring, evaluation, and reporting on the implementation of their strategies. According to this law, municipal development strategies in the FBiH should fit the framework set by the FBiH and cantonal strategies.

## CSO's Relevance in the Strategy Formulation Process: The Model

This study is primarily interested in a design and testing of a theoretical model of CSOs' relevance within a process of development strategies formulation at the municipality level. The proposed model has to be founded on the existing literature and, at the same time, applicable to the idiosyncratic political, economic, and society conditions of the FBiH.

The effectiveness of CSOs influence on policymaking and different issues of their concern has been widely studied. These studies showed that the organizational context, defined as a set of organizational attributes, represents an important

determinant of organizational relevance. Accordingly, the following hypothesis is developed:

> H1: The organizational context has a direct and positive impact on organizational relevance in the development strategies formulation processes.

Strong technical and managerial skills of CSOs, as well as CSOs' ability to adeptly interact with different society and governmental actors, are necessary for successful moderation of governmental actions. Thus, the second hypothesis is:

> H2: The CSO's proficiency has a direct and positive impact on organizational relevance in the development strategies formulation processes.

The term "proficiency" implies the overall organizational knowledge and experience, as well as its collaborative readiness and willingness. Bearing in mind this elaboration, the existence of a link between the organizational context and proficiency is imposed by itself. Thus, the third hypothesis is:

> H3: The organizational context has a direct and positive impact on CSO's proficiency.

These three hypotheses determine the theoretical (conceptual) model related to the CSO's relevance within the process of development strategies formulation, which is graphically presented in Fig. 1 (bold text).

## Model Measures

### Organizational Context ($F_1$)

This construct relates to situational factors – age, type, and size, under which organizations operate. It designates the strength and influence potential of the CSOs. Indicators for this construct rank organizations based on:

- *"Total Budget"* ($X_1$) – the total amount of their annual budget
- *"Activity"* ($X_2$) – the potential strength and massiveness, where the potential is determined by the organization's activity
- *"Membership"* ($X_3$) – the size of the membership
- *"Age"* ($X_4$) – the life span from the year of constitution to the year 2018

### Proficiency ($F_2$)

This construct refers to the overall organizational expertise and maturity, existing and potential, in its field of activity, as well as in the field of

**Civil Society Organizations in Municipal Development Strategies, Fig. 1** CSOs' relevance in development strategies formulation process – the model

strategic planning in the public sector. This important construct implies managerial vision and planning skills, as well as readiness to collaborate with many different interest groups. The indicators rank organizations based on:

- *"Participation Mode"* ($Y_1$) – the way they have participated in the process of formulating a development strategy during the time-period from 2009 to 2013
- *"Accomplishment"* ($Y_2$) – the evaluation of the quality of work done in the process of development strategy formulation
- *"Cooperation"* ($Y_3$) – the level of acceptance by other participants (interest groups) in the development strategy formulation process

### Relevance ($F_3$)

This construct relates to the organizations' participation and contribution relevance in the development strategy formulation process. The indicators rank organizations based on:

- *"Contribution Mode"* ($Y_4$) – their contribution to the formulated development strategies
- *"Impact Magnitude"* ($Y_5$) – their impact on the formulated development strategies
- *"Project Portfolio"* ($Y_6$) – their effectiveness in the project implementation rate, i.e., based on the number of projects implemented during the time-period from 2009 to 2013.

## Model Testing

To test the hypothesized model, the partial least squares structural equation modeling (PLS-SEM) was employed. For that purpose, an appropriate survey questionnaire was developed and sent to 300 CSOs from the Central Bosnia Canton (CBC). A total of 117 responses (39%) were received, out of which 43 were valid, that is, the 43 responding CSOs have participated in a process of formulating development strategies at the municipality level. The responding CSOs are proportionally distributed among different categories and different municipalities from the CBC.

### Measurement and Structural Model

Initial model testing showed a problem with the convergent validity of indicator $X_1$ ("*Total Budget*"). Namely, the outer loading of this indicator was statistically insignificant, so this indicator was removed from the model. The resulting path model is shown in Fig. 1.

Evaluation of the measurement model was made through a set of three tests – model reliability, convergent validity, and discriminant validity. All model indicators are of expected size and direction and are statistically significant (Fig. 1), which provides for the indicators reliability. In addition, the obtained values for the *average variance extracted* (*AVE*) show that each construct explains, on average, more than a half of the variance of corresponding indicators. Combining these two results together, it could be concluded that the convergent validity for the model was met.

The high *composite reliability* ($\rho_c$) values for all constructs (Fig. 1) point that indicators of each construct reliably measure that same construct. Finally, all *AVE* estimates for the model's constructs are greater than the squared inter-construct correlations, which indicates that there are no problems with discriminant validity (constructs are truly mutually distinct).

The first step in structural model evaluation is assessment of the coefficients of determination ($R^2$ values) of endogenous constructs. The $R^2$ value of the construct $F_3$ can be considered as moderate, while that of the construct $F_2$ as weak (Fig. 1). In addition, the effect sizes ($f^2$) that construct $F_1$ has on constructs $F_2$ and $F_3$ are small, while the effect size of construct $F_2$ on construct $F_3$ is large (Table 1).

The last step in structural model assessment is the examination of structural path estimates (Table 1). It could be seen that only one structural path estimate, that between the constructs $F_2$ and $F_3$, is statistically significant and in the predicted direction. The paths between constructs $F_1$ and $F_2$, as well as between $F_1$ and $F_3$, are statistically insignificant ($p > 0.05$).

**Civil Society Organizations in Municipal Development Strategies, Table 1** Structural path estimates

| Structural relationship | Standard deviation | t-value | Parameter estimate | $f^2$ |
|---|---|---|---|---|
| $F_1 \rightarrow F_2$ | 0.263 | 0.648 | −0.170 | 0.030 |
| $F_1 \rightarrow F_3$ | 0.151 | 1.376 | 0.208 | 0.087 |
| $F_2 \rightarrow F_3$ | 0.085 | 8.534 | 0.723[a] | 1.045 |

[a]Significant at 0.001

### Interpretation of the Model Testing Results

The measurement model testing has obtained the results that indicate a very good fit between the model and the reality represented by the data. A very interesting point here was the fact that the indicator related to the total budget of CSOs has been found to be statistically insignificant, even though in an expected direction. Such a finding may be a proof of constant CSOs' struggle for funding, but it can also be a result of the respondents' reluctance to reveal the true financial resources of the organizations.

The results of the specified structural model testing provide for a reliable structural path analysis and, consequently, testing of proposed hypotheses. Furthermore, the value of coefficient of determination for the endogenous construct $F_3$ – "*Relevance*," along with the value of predictive relevance indicator ($Q^2$) above zero and large effect size, implies rather high predictive (and explanatory) power of the proposed model.

The results of the structural paths evaluation (Table 1) show that estimations for the structural path between constructs $F_1$ and $F_2$, as well as between constructs $F_1$ and $F_3$, are both statistically insignificant, while the structural path between constructs $F_2$ and $F_3$ is statistically significant and in the expected direction. This means that the model does not support the hypotheses $H_1$ and $H_3$, while it fully supports the hypothesis $H_2$. More specifically, organizational proficiency is a strong predictor of CSO's relevance in the development strategies formulation processes at the municipality level. At the same time, the organizational context (i.e., CSOs' strength and influence potential) is not a significant predictor of either the organizational proficiency or its relevance in the development strategies formulation processes.

These results unequivocally suggest that organizational proficiency is just that particular trait that makes the difference between CSO's relevance and irrelevance. Activity-specific knowledge and skills, readiness to participate in the process under different conditions and to collaborate with heterogeneous parties are those specific organizational properties that increase its visibility and, consequently, relevance in the wider context. Thus, investing in and strengthening those organizational values and characteristics will improve and secure organizational results and accomplishments.

Another very interesting finding is that situational characteristics of the CSOs have no significant impact on both organizational proficiency and relevance. While the age and size may potentially increase organizational inertia and arrogance, which in effect may even have a negative impact on organizational competencies and capabilities, it is somewhat surprising that the same characteristics have no significant impact on the organizational relevance at the municipality level.

Finally, combining all these findings, it can be concluded that the CSOs need to relentlessly reinforce their proficiency, i.e., their professional competences and capabilities. Only that may ensure broad relevance to the CSO within its community and, possibly, wider. Size and strength are desirable traits, but of a rather secondary significance. This is another proof of how soft and intangible organizational resources are more valuable than the tangible ones. Just like in a famous proverb – brain is better than brawn.

## Conclusion

It is widely accepted that the participation of citizens and CSOs in government's decision-making processes strengthens its accountability and facilitates implementation of decisions adopted in such a fashion. Likewise, the application of strategic planning in the public sector increases the number of opportunities and the extent of public participation, including CSOs, and increases the number of projects, outputs, and development activities in a community.

The study found that the greater specific knowledge and participative skills of CSOs, as well as the greater degree of self-content with the outcome of participation, and the greater acceptance by other parties in the process, result in the greater likelihood that CSOs become more relevant in the process of formulation of development strategies. In addition, the same traits increase the efficiency of CSOs' project portfolio. These findings show that both municipalities and CSOs are at an advantage when they reinforce cooperation and mutual ties. Municipalities increase the significance and participatory aspect of the process of formulation of development strategies by involving more relevant representatives of the local civic sector. CSOs, on the other hand, develop their participative capacities, which is not only compensated by a greater content and collaboration capacity, but also improves the rate of project's implementation.

# Civilian Bureaucracy and In-basket Technique

Intae Choi
Yonsei University, Seoul, South Korea

## Synonyms

In-basket technique; Job competency

## Definition

This technique is presenting work situation similar to actual work practice to workers or job applicants. It can be an effective alternative in assessing worker's job competency and identifying competitive employees.

## Introduction

The organization's outcome is influenced by how people inside the organization do their work (Boardman et al. 2010). Like this, the outcome of the operation of an organization depends on securing talented individuals and utilizing them (Sanghi 2007). Therefore, hiring competitive applicants who can bring profit in the long run is important (Starks 2007). However, when hiring a new employee, there is difficulty for the organization to figure out which applicant is suitable for the needed job. When hiring competitive applicants, most companies look for applicants that are sincere, have a lot of knowledge about social issues, and able to suggest creative strategies for

the company. However, having all-around knowledge about the society and the work doesn't make the applicant suitable for the job. This is because the interviewer of the company has never witnessed the applicant actually execute a task. In other words, although the company hires a well-educated and knowledgeable applicant, that applicant may in fact end up finding it difficult to actually carry out his/her duty because there are often disparities between theoretical knowledge and job execution (van Buuren and Edelenbos 2013). Internship programs would solve such issues, but internships can be costly and adverse effects could occur; applicants who go through the internship process could potentially find a position elsewhere using their experience. A plausible solution to this could be to use the in-basket assessment technique. With the in-basket exercise, an applicant is assigned a specific job situation and is assessed how well he/she performs and prioritizes duties during a limited period of time (Schroffel 2012).

## Features of In-Basket Technique

The in-basket exercise presents an applicant with high-stress-level duties and observes how he problem-solves (Gill 1979; Rosen and Jerdee 1974). Although the observer may carefully assess the applicant's troubleshooting process, the result of a decision cannot be absolute. Therefore, the technique itself is not a result-oriented one. This is not to say that the in-basket assessment technique is one to ignore. It is premised on the fact that acceptable outcomes accompany proper problem-solving processes. In other words, in order to draw a desirable outcome, it is necessary to verify the appropriateness of the process. By observing such process, one can assess how effectively the applicant performs. The in-basket technique is not only used for entry-level hires but can also be used for existing employees' promotions or position transfers within the company. It is broadly categorized into three types – asking the applicant to set priorities, asking the applicant to solve complicated problems with limited information, and asking the applicant to arrange duties into appropriate time slots. If a company were to often utilize such in-basket technique to evaluate their members, members would be able to immediately demonstrate their potential skills upon an unexpected personnel order. In other words, this technique prepares employees to effectively display their abilities down the road. In the past, there was a saying that "a position makes a man"; however, in working environments that rapidly change these days, a position cannot always wait for an employee's individual growth. I composed the following case to further survey the in-basket technique in practice.

## The Exercise of In-Basket

To better understand this technique, I formed specific in-basket-type recruitment questions that give a sense of what the questions entail and their purpose. In the following case, a manufacture company is trying to recruit an entry-level employee for their human resources division and presents the applicant with a specific job situation. The interviewer asks the applicant to arrange various duties in appropriate time slots based on their priority levels.

### Question

Suppose that you are an employee in the manufacture company's human resource team and proceed with the following duties. Estimate the relative difficulty of each duty and prioritize them into appropriate time slots. If you determine that the task is difficult to complete within today, use both today and tomorrow to arrange the duties in a time appropriate manner.

<Task Request 1>

When recruiting entry-level employees, you must first directly speak to each college's employment center staff over the phone. Then distribute the recruitment announcements via email. After distributing the announcements, confirm that they have been officially announced by checking each college's employment site. Report the confirmations to your division chief. The estimated time

this should take is 30 min per college, and you may assume that the employment center staff will not pick up between noon and 2 pm. Employment center staff hours are 9 am to 5 pm. You will need to distribute recruitment announcements to six colleges.

<Task Request 2>
Manage payroll duties; deposit employees' paychecks into their accounts by division. The estimated time this should take is 4 h, and employees should be able to check their account balances reflecting their paychecks by 5 pm today. If paychecks do not get deposited by 5 pm, the human resources team will receive complaint calls, and each complaint call will take approximately 5 min.

<Task Request 3>
Prepare and facilitate a wage agreement meeting between the factory workers' union and headquarters, and prepare a written report. The meeting should take place in the human resources team's conference room today at 2 pm and will last for 2 h. After the meeting, a conference report should be crafted with team members, which should take 3 h. The report should be delivered to the managing director of the human resources division.

<Reimburse Filing>
Filing receipts spent in human resources division. The estimated time this should take is 20 min.

<Additional Information>
The company's lunch period is from noon to 1 pm. The company's official operating hours are from 9 am to 6 pm. Most employees precisely check their pay deposits, and if they notice they are not paid, most will make complaint calls to the human resource team. All of the above duties are your responsibility, which may not be delegated to anyone else. How will you resolve the above case? You must be able to analyze the hidden codes in each of the task requests.

The tasks presented in this case represent core duties carried out by the human resources team. <Task Request1> represents recruitment duties, and if you closely examine the details, the estimated time for the applicant to distribute the recruitment announcements to six colleges adds up to 3 h. Also to be noted is that because college employment center staff cannot be reached between noon and 2 pm, <Task Request1> cannot be executed during those hours. College employment centers operate between 9 am and 5 pm; therefore, they also cannot be reached before 9 am or after 5 pm. <Task Request 2> represents payroll duties of the human resources team, which is managed and deposited by division. The estimated time needed is 4 h, and if not properly deposited by 5 pm, complaint calls will be made to the team. Each complaint call takes 5 min, which essentially burdens down to extra work to manage. <Task Request3> regards labor management. This task takes a total of 5 h, divided between 2 h of conference facilitation and 3 h of conference report writing. However, because the meeting time is fixed at 2 pm, the applicant needs to quickly grasp that <Task Request3> must be performed between 2 pm and 4 pm. Also, it must be understood that this task be highly prioritized because the outcomes get delivered to the managing director of the human resources division. The lastly presented <Reimbursement Filing> takes 20 min and is a relatively easy task; therefore, one can observe whether the applicant effectively uses his/her downtime to complete this task.

In sum, the in-basket-type recruitment questions suggested above have three large assessment goals. First, the employer can observe what the applicant decides to prioritize among the main given tasks of the human resources division, which were recruitment, payroll, and labor relations management. In the above case, the workers' union meeting was fixed between 2 pm and 4 pm, which implies the importance of labor management. Therefore, it is likely that applicants who do not discern this do not grasp the significance of labor management within the human resources division. Also emphasized in this case is the importance of payroll duties because when not completed in a timely manner, complaint calls

become extra work to manage. Payroll duties should therefore be carried out during the morning hours; if an applicant prioritizes recruitment duties over payroll duties, it could be an indication that he/she cannot effectively manage human resources duties.

Second, once the applicant determines that his/her given tasks require more time, it can be observed whether the applicant largely considers his/her regular working hours or does not mind working overtime. In resolving the above case, most applicants are likely to strain themselves by arranging all tasks in 1 day in order to impress the interviewer and prove their diligence. However, these pertinent tasks are in fact difficult to manage in 1 day. Here, the interviewer could perhaps ask the applicant whether or not he minds working overtime, and when the applicant answers that he does not, the interviewer can additionally present a perplexing situation that demonstrates how excessive working loads could negatively impact a company's long service. In other words, the interviewer can surprise the applicant by presenting an example of an ex-employee who left the company not so long after being hired due to overworking and examine how the applicant quickly responds to such example.

Third, for those applicants who arrange their duties over 2 days and not forcefully into one, interviewers can assess a high degree of efficiency in job performance. These applicants can be asked why they arranged their duties over 2 days, and it can be observed whether or not they can manage a healthy life to work balance. In addition, a question regarding diligence can be presented, where interviewers can check whether or not applicants understand job efficiency in dilemmatic situations.

## Conclusion

As seen above, the in-basket assessment technique is an effective tool to determine potential task performance capabilities, which are not as easy to verify through conventional knowledge memorization-centered interviews. In addition to using it as a capacity evaluation tool, if a company continues to train its existing employees utilizing this technique, it can also become a tool for employees' career growth down the road. With such merits, the in-basket technique is currently widely used among many corporations, especially for recruiting entry-level members and for promoting members to management or executive level positions. However, there is an aspect that companies should be cautious of when using the in-basket technique, which is that it should not be trusted blindly for capacity evaluations. The in-basket exercise cannot fully assess an applicant's potential; no single evaluating tool could possibly measure a person's entire ability. Evaluation systems can only partially examine one's capacity. Therefore it would be advisable that companies use the in-basket technique in combination with another evaluation system. Assessing an applicant's capacity using various methods provides a range of strengths to examine, which allows for a less generalized perspective on the applicant.

## Synonyms

Environmental issue; Global climate change; Temperature change

## Introduction

At present, climate change is one of the main challenges facing the global landscape and is posing considerable anxiety to societies and to the environment. From shifting weather patterns that threaten food production to rising sea levels that raise the threat of catastrophic flooding, the effects of climate change are global in scope and unparalleled in size. Detailed analyses and studies have shown dismal future projections for mankind and protection of the ecosystems. As a result, there is a strong case for near-term action on climate change regardless of political interests and inaction by its main perpetrators. Without radical action today, adapting to these effects in the future will become more complex and expensive.

Over the years, the issue of climate change has grown in importance in the discussion forums of the countries within the Caribbean. These countries have become increasingly susceptible to the adverse effects of climate change. To make matters worse, Caribbean countries have numerous vulnerabilities that make them more susceptible. It is estimated that the Caribbean's annual cost of inaction will be about $22 billion annually by 2050 (UNEP 2008). In this context, it becomes critical for these nations to take action to enhance their capacity to operate in a concerted manner in pursuing common objectives in addressing the challenges associated with climate change.

Consequently, Caribbean countries have included environmental concerns in their development policies because of the rising risks posed by climate change to the natural resource base that maintains their economic growth. Although poverty eradication, security, unemployment, and housing continue to be of high concern, climate change is growing in significance on the national agendas of these countries. Moreover, in order to be sustainable, these nations must adopt adaptation and mitigation measures. This involves enormous financial and technological resources and, most importantly, effective national, regional, and global policy and governance frameworks (Aginam 2011).

## About Climate Change

Climate change has different meanings in different contexts. Generally, it refers to a long-term shift in the planet's weather patterns or average temperatures. The term sometimes is used to refer specifically to climate change caused by human activity, as opposed to changes in climate that may have resulted as part of Earth's natural processes (UNFCCC 1994). In this context, climate change has become synonymous with anthropogenic global warming. According to science-based journals, global warming refers to surface temperature increases, while climate change includes global warming and everything else that increasing greenhouse gas levels affect (Conway 2011).

The Intergovernmental Panel on Climate Change (IPCC) defines climate change to be any change in climate over time, whether due to natural variability or as a result of human activity. Thus, the IPCC believes that climate change has been activated not only by natural variability but also human responsibility as well. On the other hand, the United Nations Framework Convention on Climate Change (UN 1992: Article 1, Paragraph 2) defines climate change to be a change of climate which is attributed directly or indirectly to human activity that alters the composition of the global atmosphere and which is in addition to natural climate variability observed over comparable time periods.

Generally speaking, climate change is a long-term shift in the statistics of the weather (National Oceanic Atmospheric Administration 2007). The

shift is measured by changes in features associated with average weather, such as temperature, wind patterns, and precipitation. A related term is "climatic change." In 1966, the World Meteorological Organization (WMO) stated that climatic change encompasses all forms of climatic variability on time scales longer than 10 years, regardless of cause. Despite the numerous definitions and meanings of climate change, it is evident from the conferences and studies/analyses of its paramount concern especially for small states such the Caribbean given their vulnerabilities.

### The Caribbean and Climate Conferences

In February 1979 in Geneva, the first World Climate Conference was held and sponsored by the World Meteorological Organization (WMO) and several international bodies. From this meeting, the World Climate Programme was created under the combined responsibility of United Nations Environment Programme (UNEP) and the WMO. On 29 October to 7 November 1990, the second World Climate Conference occurred. At this conference, it was emphasized the need for the establishment of a framework treaty on climate change and the necessary protocols – containing real commitments and innovative solutions – in time for adoption by the UN Conference on Environment and Development (UNCED) in June 1992.

During this second World Climate Conference, several key issues were raised. These included the notion of climate change as a universal issue of humankind, the principle of equity and the common but differentiated responsibility of countries at different levels of development, the concept of sustainable development, and the precautionary principle. These issues are important to the Caribbean. These nations are not equal with external regions in relation to their rights as people. It is also evident that their development levels are not on par with the developed world. Moreover, these nations have neither fully employed mechanisms to sustain their environments for the future nor sought measures that would safeguard them against climate change.

A key development during this conference was the establishment of the Alliance of Small Island States (AOSIS). It is an intergovernmental organization consisting of low-lying coastal and small-island countries. The primary purpose of the alliance is to ensure that there is a common position by Small Island Developing States (SIDS) toward addressing global warming. AOSIS has a membership of 44 states and represents 28% of the developing countries and 20% of the UN total membership. AOSIS functions on the basis of consultation and consensus. Major policy decisions are taken at ambassadorial-level plenary sessions. The Alliance does not have a formal charter. There is no regular budget, nor a secretariat.

### United Nations Framework Convention on Climate Change (UNFCCC)

The UNFCCC is a legally binding treaty, resulting from years of international lobbying efforts. The Convention was negotiated and signed by 165 states in less than 3 years and entered into force on 21 March 1994. As the world's chief authority on climate change, the UNFCCC provided clear objectives on their mandate. Firstly, according to Article 2, the Convention's ultimate objective is to achieve, in accordance with the relevant provisions of the Convention, stabilization of greenhouse gas (GHG) concentrations in the atmosphere at a level that would prevent dangerous anthropogenic (originating in human activity) interference with the climate system (UNFCCC 2006).

Secondly, the UNFCCC recognizes that the earth's climate system is threatened by a rise in atmospheric GHG concentrations, which is caused by increased anthropogenic GHG emissions. These emissions caused by human activities cannot be eliminated from the environment. Gases listed under the Kyoto Protocol are as follows: carbon dioxide ($CO_2$), methane ($CH_4$), nitrous oxide ($N_2O$), sulfur hexafluoride ($SF_6$), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs) (ibid). Unfortunately, science cannot predict the exact volume of these gases that would be highly toxic to the planet. Additionally, scientists are unaware of how much of these emissions can be emitted before it becomes detrimental to the planet.

The Small Island Developing States Programme of Action (SIDS/POA) had its origin in the United Nations Conference on Environment and Development (UNCED) in 1992, also known

as the Rio or Earth Summit. At this conference, in Chap. 17 of Agenda 21, the international community acknowledged that small islands are a special case and have particular issues and vulnerabilities. Consequently, states agreed to hold a Global Conference on the Sustainable Development of Small Island Developing States. This was held in Barbados in 1994. The conference adopted the Barbados Declaration which recognized that SIDS contributed the least to global climate change and sea level rise, but suffered the most, and needed assistance under the UNFCCC, including adaptation measures and mitigation efforts.

There have been two subsequent conferences by SIDS in Mauritius (2004) and Samoa (2014) to address the impact of climate change on their economies. The vulnerability of SIDS to climate change was prominent in these forums. It was noted that the concentration of population, agricultural land, and infrastructure in the coastal areas was severely affected by rising sea levels due to climate change. This has had major and profound effects on these economies and living standards and even posing a serious threat to the survival of certain low-lying countries. Damage to coral reefs, affectation to subsistence and commercial fisheries production, and saline intrusion are also highlighted, as significant and rising features.

## General Characteristics of the Caribbean

Caribbean countries are located in the tropics and are generally mountainous with small areas of flat land in coastal areas. These nations share a number of socioeconomic challenges such as high dependence upon natural resources (agriculture, forestry, fishing, tourism, mining, and light manufacturing), vulnerability to global trade fluctuations, limited diversification opportunities, high transportation costs, market thinness, proneness to natural disasters, remoteness, and increasing coastal and marine concerns. These are compounded by limited availability of human capacity and the means to manage and use natural resources on a sustainable basis (Mahfuzuddin Ahmed et al. 2005).

For centuries, Caribbean people have derived their livelihoods primarily from its natural resources, ranging from metals and minerals to endemic flora, fauna, and marine life (UNEP 2008). Furthermore, economic activities in the Caribbean primarily involve direct exploitation of natural resources. Environmental vulnerability is related to the risk of damage to a country's natural capital. As such, climate change is expected to have long-lasting effects on the environment and the socioeconomic outlook of these states, as well as on well-being of the people living in these areas. Important to note is that there are some areas that are vital to the sustainability of these states such as tourism, agriculture, energy, and health.

Tourism is the major source of revenue for these nations and most rapidly growing industry across the region. The fastest rates of growth in the Caribbean have been recorded in the tourism sector of several islands (Caribbean Development Bank 2014). This area contributes significantly not only to revenue generation but employment opportunities for these states. However, climate change increases the likelihood of seasonal changes, climate extremes, and an increased frequency of hurricanes. Thus, this sector becomes very vulnerable to the extreme meteorological events of which hurricanes are the most common. This would limit the Caribbean's ability to generate revenue from the tourism industry.

Food security, one of the Caribbean's basic needs, is of utmost importance to the world. Securing new mechanisms to gather food during times of extreme climate changes is proving difficult. Caribbean nations are at a disadvantage due to limited technological advancements and smaller resource bases. Agriculture is one of the key economic sectors in the region and a major form of income and revenue generation. The threats associated with climate change on agriculture include seasonal changes, altered land suitability, water availability, and altered growing seasons. Unfortunately, fluctuations in the weather patterns can have serious adverse effects on the cultivation of some crops and be detrimental to its food supply and security.

In relation to the energy sector, recent developments have revealed substantial decreases in oil and natural gas prices which can lead to unstable

economies. Prices have decreased in the case of oil from one hundred dollars a barrel to below fifty dollars a barrel (International Energy Agency 2015). Unfortunately, this sector represents an estimated two-thirds of GHG emissions and has risen steadily over the last century. The rapid decrease in prices and subsequent increase in emissions would decrease the Caribbean's ability to gain income from this sector. Then, it would proceed to endanger the livelihood of those who are dependent upon its energy supply.

Similar to the agriculture and energy sectors, the health of the citizenry is threatened. Threats to health posed by extreme weather events in the Caribbean include insect- and rodent-borne diseases, such as dengue. Within the Caribbean region, the limited financial resources affect an appropriate and effective response to address waterborne and airborne diseases that would be transferred through storms and rising sea levels (Confalonieri et al. 2007). Climate change can turn into an epidemic of various diseases, eliminating those who are unable to afford the resources to combat against it. It would be beneficial if these areas are addressed while drawing from past experiences from the Caribbean countries.

## Adapting to Climate Change

The Caribbean region is quite vulnerable to the effects of climate change. These nations have acknowledged that climate change is a serious threat to their survival and must be addressed. As such, the region must ensure that a viable action plan is in place, but there is no "one-size-fits-all" policy for countries. These policies are devised and based on national circumstances, development goals, and socioeconomic features and cross-sectoral interactions. The goals must be to minimize and mitigate the negative impacts of climate change on human health, economic activities, environment, and infrastructure. Also, these policies must promote the development of suitable institutional systems and management mechanisms to ensure efficient preparation for and responses to climate change.

Secondly, there should be mainstream climate change adaptation strategies into sustainable development and or agendas of CARICOM member states (McConney et al. 2015). It becomes highly recommended that adaptation policies and mechanisms be integrated into national policies. This would ensure that states are implementing strategies to safeguard their citizens against the ills of climate change. These adaptation responses must be consistent with the national social, economic, and environmental developmental goals. Additionally, efforts must be made to promote and create an institutional, administrative, and legal environment, which supports the successful realization of climate change adaptation activities.

The implementation of the climate change policy must be in accordance with best industry practices in relevant aspects of policy implementation. The proper execution would also involve the participation of all government ministries and agencies. Accordingly, the government will ensure that this policy is integrated into existing and proposed sectoral policies and that relevant legislation is drafted and amended. The implementation of this policy would be through the establishment of applicable strategies and action plans implementable over a period of time. The government will adopt strategies and actions that are environmentally sustainable and compatible with economic growth and social development.

Thirdly, promote the implementation of specific adaptation measures to address key vulnerabilities in the region (McConney et al. 2015). In this regard, it is important to educate the citizenry on the issues of climate change. In some cases, citizens are unaware of national issues, thus leading them to act rashly toward or distrusting of new institutional adjustments. To address this issue, it is critical that citizens be sensitized on the vulnerabilities of their states and proposed future solutions. Consequently, citizens and policy makers would make decisions grounded in fact. A part of this process is how to promote actions to reduce GHG emissions through fossil fuel reduction, conservation, and changing to renewable resources.

It is essential to promote and encourage actions that reduce the vulnerability of natural and human

systems in the Caribbean countries to the impacts of a changing climate. According to McConney et al., one must reduce vulnerability to climate change (ibid). As stated prior, reducing vulnerability has several parts: identification of personal vulnerabilities, assessing those vulnerabilities, and finding solutions that would help the state to cope with the said vulnerabilities. Furthermore, the establishment of Caribbean Community Climate Change Centre can support the implementation of strategy. As citizens become aware of the dangers of climate change, implementation of strategic action would benefit each nation according to their strengths and weaknesses. The Caribbean has formulated its plan of action, but it needs support from every member nation to succeed.

## Conclusion

Generally, it is acknowledged and recognized that climate change poses many challenges for the Caribbean region. Therefore, CARICOM nations must find methods to adapt to our changing ecosystems by improving lives. Of course, adapting to climate change is costly and requires changes in societal customs and behavior. Due to wide range of insecurities associated with climate change, the adoption of no-regrets principle is important in order to use and manage limited resources practically and to deal with the many changes associated with climate change in the region. In spite of the wide range of adaptation options that could be successfully implemented in the region, some basic challenges limit the range of options and their implementation.

A changing climate makes the process of adaptation more urgent for the Caribbean. Undoubtedly, it is only when adaptation strategies and policies are implemented will the region's vulnerability be diminished. Important to note is that climate change mitigation activities could assist sustainable development initiative and other spin-off benefits such as decreased air pollution, improvement in the balance of trade, modernized energy services for rural areas, lessening environmental threats as a result of fossil fuel pollution, and the creation of more jobs. Furthermore, most Caribbean countries rely on expensive imported fossil fuels and savings accrued from renewable energy, and energy efficiency measures may allow scarce resources to be channeled to adaptation activities.

Generally, there are some obstacles which hinder the capacity of the Caribbean countries to effectively respond to the effects of climate change. These include inadequate data or information and technical capacity for timely and effective adaptation planning, weak institutional capacity, and limited financial resources. There is also a lack of information on likely changes in climate and human systems at the small-island scale. As a result, most of these nations have not embarked on an in-depth study of the impact of climate change and assessment of vulnerability in a cohesive and integrated manner. Without such analyses, it remains challenging to devise solid adaptation policies, strategies, and programs.

With the Caribbean countries facing a variety of pressing economic and social challenges, however, there is an urgent need for a well-structured institutional framework to address climate change adaptation issues across sectors and scales. Hence, strengthening institutional capacity remains an important prerequisite for the effective planning and implementation of adaptation strategies at national levels. Some of the adaptation options identified for these countries may be costly and beyond their financial capacity. The governments of these countries will therefore need international assistance to facilitate more detailed research into traditional and generally less costly forms of adaptation.

## Climate Change, Agricultural Productivity, and Farmers' Response in India's North-East

Utpal Kumar De
Department of Economics, North-Eastern Hill University, Shillong, Meghalaya, India

### Synonyms

Climate change adaptation; Farmer's response to climate change; Innovation in agriculture

### Introduction

Agricultural productivity and pattern of crop diversity across regions have been subject to the changing agroclimatic conditions of respective regions (Peng et al. 2004; Aufhammer et al. 2006, 2011; Kar et al. 2004; Wejnert 2002; Deschenes and Greenstone 2007; Feng et al. 2010; De and Bodosa 2014). As changing production condition leads to the variation in productivity of crops, it also affects farmer's option for diversification of land use in an optimum manner. Also, uncertainty on account of market information gap disallows farmers to adopt appropriate crop diversification (Ellis 1989; Anderson 2003) and adopt new technology (Rasul et al. 2004; Knowler and Bradshaw 2007; Teklewold et al. 2006). However, productivity growth and crop diversity are closely linked with the agricultural prosperity and hence agro-economic development of a country (Kasem and Thapa 2011; Hutagaol 2006; Pingali 2004). Under changing climatic conditions, the agricultural sustainability of any region depends on farmers' capability to adapt to the changing climatic conditions and moderate its adverse impacts on the agricultural performances of that region.

Adaptation to climate change refers to adjustments to practices, processes, and systems to minimize current and/or future adverse effects of climate change and take advantage of available opportunities to maximize benefits (Eriksen et al. 2011; Pauliotte et al. 2009). Adaptation and mitigation in agriculture requires local responses. Selection of crop variety and diversification, date of planting, harvesting, tillage, fertilization, etc. are some possible adaptation strategies to changing climatic pattern. However, farmers' adaptability to the changing climate and choice of suitable cropping pattern largely depends upon their awareness and skill to anticipate the expected situation that is highly dependent on their education, available information, training, extension services by the outside agencies regarding climate change and assets, and access to appropriate agro-technology and agro-infrastructure (IPCC 2007a; Anselm and Taofeeq 2010; Onyeneke and Madukwe 2010; Adensina and Forson 1995; Krishnamurthy 2012). Moreover, innovative agricultural practices and technologies can play an important role in climate mitigation and adaptation. This adaptation and mitigation potential is nowhere more pronounced than in developing areas like North-East India where agricultural productivity remains low; poverty, vulnerability, and food insecurity remain high; and the direct effects of climate change are expected to be especially harsh (Lybbert and Sumner 2010).

Assam is the largest agrarian state in North-East India dominated by small landholdings (average 1.2 ha; GoA 2012–2013) with high weather dependence and substantial agricultural diversity. Climate of Assam region recorded gradual changes over time as reflected in uncertain variations in rainfall, rising temperature, and erratic humidity level. In recent years, the highest level of precipitation is observed in Assam (De and Bodosa 2014) either in pre-normal monsoon months of March–May or during post-monsoon months of August–October, resulting untimely devastating floods. Flood is a common phenomenon of Assam and Dhemaji, Lakhimpur, Nagaon, and some other districts are highly flood prone. Moreover, both maximum and minimum temperature has been observed to increase consistently, and the winter months recorded faster growth across different parts of the state. Needless to say that rising uncertainty in monsoon rainfall and temperature seriously affect pattern of agricultural activities undertaken by the farmers and their livelihood conditions as well. It thus necessitates appropriate preparedness and continuous adaptation in the crop and non-crop activities for the reduction in risk and best possible livelihood practice in the region.

Changing climate and extreme climatic behavior like sudden floods and droughts has extensive impacts on the agricultural activities and its productivity which would compel rural farmers to shift their existing cropping pattern to reduce risk (Aufhammer and Vincent 2012; De and Chattopadhyay 2010). Agricultural performance of any region is highly vulnerable relatively to the variability in local climate across its different locations rather than in global climate patterns that raises risk and uncertainty (IPCC 2007b; Ye et al. 2013). Under growing uncertainty, maintenance of agricultural productivity depends on the adaptability of the farmers with the changing weather pattern over the years. Farmers of the developing countries, especially in rural areas, are supposed to be hardest hit to the extreme climatic events such as floods and droughts for the reduction in crop yields in most tropical and subtropical regions that also happens due to changes in water availability (Adger et al. 2003; IPCC 2007a; Tanner and Mitchell 2008). Rural poor normally have limited adaptation choices including very limited options to diversify cultivation of crops. At the same time, they are more vulnerable than the rich farmers to agricultural disruptions, and they lack in access to improved technologies such as flood- and drought-resistant varieties of seeds or crop insurance, lack of access to capital and knowledge. However, most of those farmers are aware of the fact that greater crop diversity and mixed farming (crops and livestock) offer considerable protection against farming risk, including climate-related risk (FAO 2011). In order to get rid of such climate change risk or climate extremes, continuous adaptation is inevitable. Crop diversity is the agriculture's greatest way of adaptation and the foundation for future efforts to feed the world (Kyte 2014). It is therefore important to analyze farmers' perception and awareness about crop diversification as their adaptation actions followed toward climate change scenario in the region. Though there are several studies on the process of diversification of crops along with the other resources to deal with the changing weather pattern, agro-technology, and infrastructure for a sustainable agricultural growth (Krishna et al. 1991; Bastine and Palanisami 1994; Dale 1997; Hazra 2001; De 2003; Mehta 2009), the analysis on adaptation measures adopted by the farmers in response to changing weather pattern, different agro-technologies, and risk and uncertainty on account of the climate extremes is rare.

## Changes in Agroclimatic Condition of Assam

Assam is well known for its diverse sub-Himalayan agroclimatic conditions which is suitable for the growth of varieties of crops across the districts. The climatic conditions in the state also changed significantly over the years and that to some extent led to the variation in crop cultivation but not observed to be in line with the growth process as expected from a progressive agricultural economy. Here, temporal variation in major components of weather like rainfall and -max-min temperature during 1950–2010 is observed.

Thirty one years' average figures of monthly average minimum and maximum temperature show a rise in minimum temperature in the range of 1.1–1.3 °C while a rise of maximum temperature from 0.7 °C to 1.8 °C. Also, variation in average minimum temperature across the months of the year declined significantly the rate along with the rising yearly average minimum temperature over the years. Thus, an inverse relation is revealed between the yearly average temperature and the seasonal variation in minimum temperature. This is an indication of gradual convergence of seasonal temperature with global warming in the state. However, there is insignificant change in month-wise variation in maximum temperature with rising trend, which is subject to significant volatility in the prime monsoon months that starts little early than the normal monsoon season of Indian plains. Zone-wise variation in minimum temperature has also been rising at a faster rate than the maximum temperature. This growing regional variation is also associated with increasing volatility.

Yearly rainfall also declined during the last six decades. Not only that, its seasonal pattern has been changed and the monthly rainfall reaches its peak alternately in June, July, or August. Three decades' average rainfall in the peak months declined from 486.2 mm during 1950–1980 to 444.7 mm during 1980–2010. Despite the fall in total annual rainfall, occurrence of flood became erratic for heavy concentration of rainfall in a few days when maximum portion of rainfall of the season occurs. The share of the annual rainfall that occurred during the peak monsoon months declined over time. Not only having interzonal skewed distribution of rainfall, the month-wise variation in rainfall also increased significantly in the high rainfall areas, while that of low rainfall area declined. In Lakhimpur and Dhemaji zone, monsoon rainfall has increased continuously over the years during Kharif season, and thus incidence of flood and its severity also increased that has more damaging impact on the late summer and autumn crops. In Karbi Anglong and N.C. Hills, rainfall over the years shows more erratic pattern, and thus farmers avoided settled paddy cultivation even in low lying areas in order to avoid uncertainty, and the diversity pattern shows people's preference for more tea, horticulture, and ericulture on the basis of wildly grown host plant, castor. Gradually, farmers in other areas also tried to switch over to the short period, more resistant crop varieties to reduce the risk of cultivation due to changing frequency, intensity, and timing of occurrence of rain and flood emanated from the long-term changes in climatic condition, which has been closely associated with the changing relative humidity and temperature variation across the months and regions over the years.

## Spatio-temporal Variation in Composite Agricultural Productivity

The overall agricultural productivity as measured by *Composite Productivity Index* (CPI) (De 2003) varies significantly across the zones of the state and over time, respectively. The range of spatial variation is found to be increased from 1951–1952 to 1971–1972, and thereafter it declined and stabilized.

The Lakhimpur, Karbi Anglong, and N.C. Hills were at the top three positions in respect of overall agricultural productivity during 1951–1952 to 1981–1982, and Kamrup was at the bottom position in the relative ranking. Remarkable achievement in overall productivity index has been found in case of Cachar, which has jumped over many other districts in this respect after 2000. Also, Kamrup progressed a lot in this respect. "Various convergence measures" suggest district level convergence of overall agricultural productivity, particularly during 1951–1952 to 1976–1977 and stabilized after that till 2010–2011).

### Land Use Pattern and Area of Operational Holdings in the Sample Village

In order to understand the farmers' response to changing climatic condition, a primary survey was conducted in two extremely opposite agroclimatic districts, Kokrajhar and Dhemaji. Kokrajhar never faced any drought or flood, while Dhemaji regularly faces severe flood, and farmers need to adjust with changing climate for survival. Information was collected from

300 farmers belonging to six villages (three each of those two districts). One of the important characteristics of the survey villages is that the chosen farm families are mostly small (more than 1 ha but less than 4 ha) and marginal (below 1 ha) farmers. Also, there is nonuniform distribution of cultivated area among farming households in all the villages. About 66% and 65% of the respondent farmers in Kokrajhar and Dhemaji districts, respectively, are small holders. However, more than 25% of farmers have landholdings between 30.0 and 75.0 bighas in Dhemaji district, while about 7% of the farmers in Kokrajhar belong to that group. It also indicates the presence of common land-leasing practice in all those villages. The landholdings are not only small in size but also fragmented into many parcels due to subdivisions on account of breakdown of the joint family system and law of inheritance. The lease-out and lease-in phenomena are found to be more prominent among the marginal and small farmers. However, lease on short-term contracts and substantial fraction of croplands would lead to fewer incentives for investments in soil conservation by the operators. However, owner farmers have more capacity to adopt new technologies frequently than owner-cum-tenant and tenant farmers (Habiba et al. 2012). Moreover, it is widely believed that land ownership encourages adaptation of technologies like irrigation, application of fertilizer, etc. Farmers adapt their choice of farm type and irrigation to their local climate that treats the choice of crops, livestock, and irrigation as endogenous factors (Mendelsohn and Seo 2007).

### Cropping Pattern in the Sample Villages

Various types of crops are cultivated by the respondent farmers in different seasons. Generally, paddy, oilseeds, sugarcane, potato, etc. are grown abundantly in the study area, and cultivation of areca nut, bamboo, and banana is also observed almost in all the villages. Though different food and non-food crops are grown by them, over 82% of area is found to be allocated for food grains in the two consecutive preceding years, i.e., in 2011–2012 and 2012–2013. It is also observed that the farmers in Dhemaji district are cultivating proportionately more food-grain crops than Kokrajhar.

Rice occupies the predominant place in the total cropped area, and mustard is the second most important crop. Share of non-food gains is still very less (merely 18% of GCA). This is an indication of very poor level of diversification and that toward inferior crops, which happens only when there is a lack of basic inputs like irrigation, access to capital, and other technology. However, there is significant inter-village variation in allocation of land toward non-food crops including jute, areca nut, sesamum, mustard, bamboo, and tea. Most of the farmers in Dhemaji district utilize a part of their cultivable land for mustard, bamboo, and areca nut. This may be due to the occurrence of floods in rainy seasons that force the poor farmers to cultivate early some winter crops but less capital intensive and cultivate bamboo that can sustain in flood and protect homelands from the flood. However, for non-food-grain crops, it is irrigation that is important, as many of these crops are highly water intensive. Potato and chilly are grown mostly for home consumption like other vegetable crops by the farmers in the study area. All these above reflect the non-arrival of the Green Revolution technology at desired level, and the rural farmers have not yet fully adapted to the modern methods of cultivation.

Another important feature of surveyed area is that most of the farmers follow single cropping system. The low incidence of double cropping is due to the prevalence of traditional and subsistence farming depending primarily on rainfall with very limited irrigation facility, use of chemical fertilizer, and flood and pesticide control arrangements. However, out of 24 varieties of crops cultivated in these two sample areas, most of the farmers (62%) in Dhemaji district are found less diverse in cropping pattern. Whereas, Kokrajhar district are more diverse as compared to Dhemaji and growing relatively more number of crops (over 70%). Moreover, there is great variation in the pattern of diversification across the villages in both the districts. This variation is in line with the disparity in share of income generated from the crop-raising activities. However, some varieties of rice are found to be grown by the sample farms.

Overall, about two-third of the total sample farmers are agriculturally low crop diversified.

However, farmers in Dhemaji district are relatively more diversified than that in Kokrajhar. It may be due to the impact of extreme climate hazards (especially regular flood) in the area. Another reason is the less availability of farm land or farm size in Kokrajhar that constrained many farmers to diversify toward many crops and more equitably. The low-diversified farm families have an average farm size of only 14.54 bigha, while the high-diversified farm families have an average farm size of 24.95 bigha. Per capita income of those high-diversified families is much more than that of the low-diversified families. Total area under cultivation and degree of diversification have significant positive impact on the earning from agriculture, while with rising number of agricultural laborer adversely affect the agricultural earnings of the families.

## Measures Adopted to Mitigate Climate Risk in the Study Area

This section tried to focus on farmer's perceptions and adaptation strategy followed in Assam. It provides information on the farmer's response to climate change and possible factors that influence their adaptation of strategies to moderate extreme climate impacts. Diversification of crops is one of the important adaptation measures where with the changing climatic conditions farmers can choose suitable cropping pattern over the years to adjust with the changing climate and simultaneously maximize returns from agriculture in their respective region. However, geographical locations and socioeconomic conditions have important influence on the farmer's adaptability with the changing technology and climatic conditions in diversifying their crops. Sources of acquiring new knowledge or information about agricultural technologies and their cost effectiveness are important factors that also affect technology adoption. However, most of the farmers in Assam particularly the tribal farmers (Since Kokrajhar and Dhemaji are tribal-dominated districts and sample farm households are mostly tribal farmers in these districts) are unaware of many programs sponsored by the government to promote adaptation of new technologies. It may be due to the lack of dissemination of information or knowledge regarding agricultural techniques. These farmers being more tradition ridden and conservative are found to be less responsive toward the adoption of new agricultural technology. However, some farmers are ready to adopt new agricultural technology (as observed from foregoing discussions) but are not in a position to adopt the improved technology at the full scale due to certain socioeconomic constraints faced by them in their daily life. Even then they have used some sort of modern implements on hiring basis with their limited capacity. Usually, farmers produce both the modern and traditional varieties of crops simultaneously depending upon the availability of seeds and capital.

Experience of last 5 years by the respondents reveals that the entire Kokrajhar district has never been affected by floods but rarely do they face drought. Thus, no damage of crops due to extreme climatic hazards is reported by the farmers in the district as a whole. However, drought-like situation damages some crops in southern parts of the district (Ubrijhora area), and damage of some crops of a few farmers due to pests and insects are reported for the last 5 years. On the other hand, farmers of Dhemaji district reported damage of their crops due to regular floods. Thus, farmers of Kokrajhar district hardly followed any adaptation measure to save their crops from floods and droughts in the last 5 years as the farmers have not been affected by these climatic hazards severely in the past. On the other hand, farmers of Dhemaji district reported several adaptation measures to save their crops particularly from floods that occur frequently every year and at different times. Most of the respondents adopt early cultivation method and cultivate short-period crops to save from floods and harvest early. They argued that early land preparation and plantation is associated with increased chances of survival of the crops (mainly winter paddy) from floods. Over three-fourths of the respondents preserve seedlings for sowing again if the crop is damaged due to flood during the peak monsoon time.

Farmers have reported to have changed their cultivation of crops (whatever possible) in the last two decades (i.e., 1990–1991 to 2012–2013) for

various reasons. Some farmers (18%) of Kokrajhar district have changed traditional varieties to newer crops due to availability of HYV seeds; 83% of the respondents of the same district changed cropping pattern to earn more profit. Some of them cited lower cost of cultivation for changing cropping pattern. No weather-resistant crop varieties have been chosen by the farmers of Kokrajhar district. On the other hand, risk factors (19.33%), earning profits (46%), lower cost of cultivation (31%), and weather resistance (4%) are cited to be the prime reasons for adopting newer varieties of crops during the last 20 years by the respondent farmers of Dhemaji district.

It thus clearly indicates that, despite a number of constraints faced by the farmers in the study area, there is enormous scope to diversify their crops, and adaptability varies across the space with the changing technology and environment. Adaptation and disaster mitigation requires adequate knowledge, access to suitable technology, capital, and appropriate policy measures. A failure in adaptation with the changing climatic uncertainty may lead to socioeconomic disaster and jeopardize the livelihood security of the people particularly those who are dependent more on natural weather for agricultural activities.

## Adaptability of Farmers in Response to Climate Change

Agricultural adaptation to climate risk is a relatively new field of inquiry in North-East India. Knowledge of the respondent farmers and farm size and area of holdings and share of family income from agricultural activities are found to be important factors for the diversification by the farmers. Training to the farmers and irrigation intensity however do not significantly influence crop diversity here. This may be due to the fact that training on cultivation of particular crops makes the farmers proficient on some specific crops and not on diversification needs. Also slowly growing irrigation facilities helped the small and marginal farmers to go for some staple food crops for food security, and agriculture is still at subsistence stage.

In respect of adaptation, looking at the features of the farmers, it is observed that the level of education of the heads of households improves level of adaptation. Education generally increases knowledge and helps farmer to gain adaptive capacity to the changing climatic conditions and use of appropriate agro-technologies. The size of operational holding of the farmer (total cropped area) and years of cultivation experience also have significantly positive impacts on adaptation. The implication is that adaptive capacity of farmers increases with the increasing size of the landholdings and cultivation experience. However training of the farmers is found to have no impact on adaptation as the training conducted by the concerned departments are basically held to train farmers on raising crop productivity through theuse of modern technology rather than on adaptation and awareness strategy toward climate change in Assam.

It is therefore clear that size of holdings and education level of the farmers are important factors for the extent of diversification and adaptation of crops with the climate change in different districts of Assam. This is in conformity with the results obtained by some other researchers not only in India but in some other countries as well (Pingali et al. 1997; Mendelsohn and Seo 2007; De and Chattopadhyay 2010; Anselm and Taofeeq 2010; Onyeneke and Madukwe 2010, Sahu and Mishra 2013).

The above discussion reveals that, in spite of many problems and limitations, the rural farmers of Assam manage to raise varieties of crops under rain-fed weather condition depending upon their availability of resources. One of the major factors hindering the proper utilization of new farm technology is the dominance of scattered tiny plots (marginal and small in size) in the state. It is needless to mention that training of farmers on available modern technology can go a long way in accelerating the agricultural production and productivity.

Most of the farmers are found to be risk averter and are skeptical in trying new varieties. It is also observed that farmers are not aware of the concept of crop planning, and the effort of the agriculture department to train the farmers is inadequate. As expected in the traditional cropping system, thus crop diversification is limited as the farmers do not have suitable facilities and supporting agro-

infrastructure. Lack of climatic change perception of the farmers in the study area of Kokrajhar is due to limited climate change effects in the area. Nature of adaptation with the changing technology and climatic conditions by some sample farmers of Dhemaji however proves that farmers are eager to adopt newer technology in their cropping activities to save their crops and moderate climate change impacts.

## Concluding Remarks

The above discussion clearly indicates significant changes in climatic variables like minimum and maximum temperature in Assam that is associated with high degree of seasonal and regional variations over time. Share of peak rainfall season has also declined with rising fluctuations and reduction in overall annual rainfall. There is slow growth of overall agricultural productivity, which is associated with significant regional convergence. Due to uncertain weather changes, crop diversification as a measure of moderating climate change effect is found to be far from the scope.

Cultivation of a large number of crops indicates the suitability of agroclimatic environment in Assam. Majority of the farmers are small landholders, and their income from crop and non-crop activities is not enough to meet their subsistence, and they produce only a few specialized crops which are vulnerable to uncertain weather changes. Suitable diversification can stabilize the farm income by minimizing the risk associated with only one crop.

Moreover, there is urgent need for restructuring the existing crop sequences so as to make suitable adjustment to changing climatic condition in flood-prone districts of Assam. Hence, emphasis should shift toward growing more *rabi* crops with assured irrigation support. There is ample opportunity for increasing the production of summer rice and short-duration paddy in the sample area in particular and Assam in general. For introduction and popularization of new crop varieties, adoptive and result-oriented field demonstration may be encouraged. In the flood-prone areas, short-duration variety of paddy may be cultivated and harvested early to avoid flood damages. Adaptation options such as irrigation management and promotion of improved crop varieties are only viable if there is external support. However, there is a need to focus not only on technical aspects but also social dimensions such as perceptions of smallholder farmers. Government and policy makers should support farmers to generate long-term and location-specific adaptation strategies, and therefore, major thrust should be given on the development of irrigation, easy reach of modern agro-inputs, and provisions of location-specific and need-based solutions to support crop diversification.

# Coastal Zone Hazards Management

Claire Connolly Knox
University of Central Florida, Orlando, FL, USA

## Synonyms

Climate change; Coastal zone management; Flooding

## Definition

The coastal zone is generally referred to as the area where the sea meets the land. The formal definition, as stated in Section 304 of the Coastal Zone Management Act of 1972, is:

> the coastal waters (including the lands therein and thereunder) and the adjunct shorelands (including the waters therein and thereunder), strongly influenced by each other and in proximity to the shorelines of the several coastal states, and includes islands, transitional and intertidal areas, salt marshes, wetlands, and beaches.

There are 95,439 miles of shoreline in the United States and some states are primarily comprised of a coastal zone – the entire state of Florida is considered to be in the coastal zone.

## Introduction

Historically, coastal areas have been popular for a number of reasons, including trade and commerce with ports; mineral and resource extraction; and ecotourism with recreational activities, such as fishing, sunbathing, and birdwatching. The coastal zone remains a popular place to live. Globally, nearly 3 billion people are living within 100 miles of a coastline. In the United States, approximately 165 million US residents live in the coastal zone. Specifically, 23 of 25 most populous US counties are coastal and the trends are increasing. Between 1970 and 2010, the largest age demographic to move to coastal communities was 65 years and older; this demographic experienced an 89% increase (NOAA 2013). Hispanics and Latino populations increased by 211% between 1980 and 2010 in coastal communities (NOAA 2013). By 2020, there will be an additional 11 people per square mile living in the coastal zone, or approximately 10 million more people (NOAA 2012). These coastal zones are economically significant. For example, US coastal counties have contributed approximately 70 million jobs and $9.5 trillion to the gross domestic product (NOAA 2015). While the coastal zone is popular and productive, it has experienced multiple and costly human caused and natural disasters. For example, since 2000, disasters have cost the United States nearly $414 billion and 2,700 deaths with a majority of the disasters directly affecting coastal counties (FEMA 2015).

Globally, these zones are comprised of many different types of ecosystems and habitats, including estuaries, sandy beaches, coastal wetlands, lagoons, tidal marshes, reef and barrier islands, coastal deltaic plains, mangrove forests, and cliffs. They also serve aquifer recharge zones, wildlife habitat, fishery nurseries, and storm buffers. Losing these habitats results in a loss of these valuable ecosystem services. In fact, a majority of the 36 biodiversity hotspots are located in a coastal zone. These hotspots are biogeographic areas with more than 1,500 endemic vascular vegetation, experiencing at least 70% loss of its original habitat, and remaining threatened (Myers et al. 2000). In 2016, the North American Coastal Plain was designated the latest, and one of the largest, biodiversity hotspots. A combination of increased human population and sea-level rise has contributed to approximately 85.5% natural vegetation loss or alteration (Noss 2016).

## Coastal Zone Hazards

Managing hazards in the coastal zone involves the intersection of multiple disciplines including emergency management, urban and regional planning, public administration and policy, engineering, and environmental management. An

interdisciplinary approach is needed to directly plan for, mitigate, and manage human caused and natural hazards directly and indirectly affecting coastal communities and ecosystems around the world. Human caused hazards include oil spills, human development, climate change, and pollution, while natural hazards include hurricanes, tsunamis, sea level rise, earthquakes, flooding, erosion/land loss, and invasive species.

## Case Study: Louisiana

Louisiana has lost approximately 1,900 square miles of coastal land since the 1930s and is projected to lose an additional 500 square miles in the next 50 years. Similar to other coastal regions, this coastal zone contains 49% of the state's population and 40% of the nation's wetlands. This coastal zone has been challenged with land subsidence and sea level rise at the average rate of 16 square miles per year – one of the highest rates in the world.

Three primary factors contribute to saltwater intrusion that destroys freshwater vegetation and leads to further erosion:

- Multiple hurricanes (specifically Katrina and Rita in 2005, Gustav in 2008, Isaac in 2012) have destroyed vegetation and force salt water into a fresh or brackish ecosystem.
- After the Flood of 1927, the US Army Corps of Engineers leveed the Mississippi River to the outer continental shelf. This prevents freshwater and sediments from entering the wetlands, which can rebuild land and push back the salt water.
- An active oil and gas industry have cut canals into the wetlands allowing salt water to move deeper into the wetlands (thereby killing freshwater or brackish vegetation). The removal of underground resources increases the subsidence rate.

The hurricanes and Deepwater Horizon Oil Spill created $120.85 billion in damages, resulted in nearly 2,000 deaths, and destroyed 217 square miles of wetlands. In addition, nonpoint sources of pollution from the central United States combine in the Mississippi River and cause the world's largest, reoccurring dead zone measuring 6,824 square miles (approximately the size of the state of Connecticut). These coastal hazards have negatively impacted the communities economically, socially, and environmentally with recovery expected to last years if not decades.

Experts predict that portions of the coastal zone will not recover. In fact, the first US federally funded climate refugees are from Isle de Jean Charles. This small island on Louisiana's southeastern coast has lost 90% of the original land mass since 1955. The majority of residents belong to the Biloxi-Chitimacha-Choctaw Native American tribe. In January 2016, the US Department of Housing and Urban Development provided this community with a $48 million grant for relocation, which it needs to spend by 2022. This is a third attempt to relocate the residents; approximately half are resisting as their heritage and culture are interwoven with the disappearing landscape.

Yet Louisiana is not alone; coastal communities globally are struggling with planning for, mitigating, and managing coastal hazards. The United Nations predicts that by 2050, the effects of climate change will displace approximately 50 million to 200 million people, many of whom are farmers and fishermen. Therefore, leaders from around the world are monitoring the Isle de Jean Charles climate refugee resettlement plan – one of the first of its kind – as an effort to respond and mitigate an ongoing coastal hazard.

## Federal Coastal Programs

While issues related to coastal hazard management are often a global phenomenon, such as climate change, the impacts are felt locally; this stresses the importance for the planning, mitigating, and managing of coastal hazards at the local government level. Researchers in the coastal planning discipline conclude that local governments will have higher quality comprehensive land use, coastal management, and hazard mitigation plans if there is a federal or state requirement. However,

many states do not require local governments to have such plans, which often lead to communities developing on hazard-prone lands.

The federal government, under the leadership of the National Oceanic and Atmospheric Administration (NOAA), the US Army Corps of Engineers, US Fish and Wildlife Service, and Federal Emergency Management Agency (FEMA), has provided incentives, funding, and training to increase the state and local governments' capacity to create, adopt, and implement programs and plans to prepare for, respond to, recover from, and mitigate hazards in coastal zones. There are multiple federal policies addressing these challenges, including (but not limited to):

- National Environmental Policy Act of 1969
- Clean Water Act of 1972
- Coastal Zone Management Act of 1972
- Water Resource and Development Act of 1974
- Coastal Barrier Resources Act of 1982
- Coastal Barrier Improvement Act of 1990
- Coastal Wetland Planning, Protection, and Restoration Act of 1990
- Disaster Mitigation Act of 2000

Of these policies, the Coastal Zone Management Act (CZMA) is the most applicable to this issue, with the goal to "preserve, protect, develop, and where possible, to restore or enhance the resources of the nation's coastal zone" (NOAA 2016, para. 1). (Additional information about the CZMA is available here: https://coast.noaa.gov/czm/act/). Three programs are available under the CZMA: National Coastal Zone Management Program, National Estuarine Research Reserve System, and Coastal and Estuarine Land Conservation Program. Specifically, the National Coastal Zone Management Program is a voluntary program encouraging collaboration between coastal states and NOAA. Each participating state creates a coastal management plan, which, when approved by NOAA, qualifies them for annual implementation funding. As of 2015, 34 states and territories participate in the program, which protected 19,000 acres and restored 12,000 acres of coastal habitat between 2011 and 2014 (NOAA 2015).

More recently on March 6, 2016, FEMA started requiring states to include risks and hazards associated with climate change in their state hazard mitigation plan in order to qualify for federal disaster funding under Section 404 of the Stafford Act. Details are provided in the Hazard Mitigation Grant Program and Public Assistance Grants Categories C-G. State hazard mitigation plans need to include:

> a summary of the probability of future hazard events that includes projected changes in occurrences for each natural hazard in terms of location, extent, intensity, frequency, and/or duration and considerations of changing future conditions, including the effects of long-term changes in weather patterns and climate on the identified hazards. (FEMA 2016, 11)

Some state, tribal, and local governments lack the financial capacity to create or update a FEMA approved hazard mitigation plan. Program funding is available following a major disaster declaration by these entities to implement long-term hazard mitigation measures (for additional information, visit www.fema.gov/hazard-mitigation-plan-requirement). Additional financial support is available to qualified states under the Disaster Mitigation Act of 2000.

Even with these incentives and federal programs, more needs to be done, as coastal communities continue to plan and build in hazardous areas. These actions place populations in vulnerable situations and expose them to the damaging effects of multiple hazards. Scholars have discussed various barriers to coastal resilience, including lack of technical, financial, management, and planning capacity for long-term planning; low priority of disasters and hazard mitigation for government authorities; individual rights taking priority over social needs (such as private property rights); lack of long-term planning in short policy cycles; and the assumed high costs of mitigation projects. Although many of these barriers are embedded in institutional cultures, others are not. For example, FEMA reports that for every $1 spent on hazard mitigation, communities experience a $4 return on that investment during the recovery phase of a disaster (Multihazard Mitigation Council 2005).

## Example of Mitigation Projects

Globally, there are many successful structural and nonstructural hazard mitigation projects in coastal zones. Structural projects can include seawalls, rip-rap, breakwaters, groins, and jetties; nonstructural projects can include building codes, land acquisition, comprehensive land use plans, hazard mitigation, zoning, and vegetation. Two projects are featured below: Caernarvon Freshwater Diversion Project in Louisiana as an example of a structural project and Canaveral National Seashore Restoration Project in Florida as an example of a nonstructural project. These projects are located in the designated North American Coastal Plain biodiversity hotspot.

### Caernarvon Freshwater Diversion Project

Brenton Sound estuary, located in the Plaquemines-St. Bernard delta, is 1,100 $km^2$ of fresh, brackish, and saline wetlands. Between 1956 and 1991, it lost approximately 3,400 acres of wetlands – one of the highest rates of erosion and subsidence along Louisiana's coastal zone. Throughout the history of this estuary, man has cut multiple crevasses – deep cracks – into the Mississippi River levee. Most notably, men created a crevasse during the Flood of 1927 with explosives to save New Orleans from devastating flooding, thereby destroying the community of Caernarvon. For additional historical information about the Mississippi River levee system, read John Barry's 1998 book *Rising Tide: The Great Mississippi Flood of 1927 and How It Changed America*.

In 1988, the US Army Corps of Engineers started the construction of a permanent crevasse – the Caernarvon Freshwater Diversion Project. It is located south of Caernarvon and Braithwaite communities (Mississippi River mile 82) in Plaquemines Parish. It was authorized by the Water Resource Development Act and Flood Control Act, and the construction cost was $26.1 million. The project area is approximately 15,500 acres and is the largest of six diversions in southeastern Louisiana. In August 1991, freshwater, nutrients, and sediment from the east bank of the Mississippi River flowed into Brenton Sound estuary at a rate of 8,000 cubic feet per second through five vertical lift gates in box culverts. At the time of its construction, it was the largest freshwater diversion project in the United States.

Twenty years later, the increased sediments and freshwater flow created 802 acres of wetlands; long-term monitoring is expected to end in 2041. Yet, this project is not without conflict. Between 1994 and 2005, representatives from the local oyster fishing industry filed multiple lawsuits claiming the freshwater diversion was killing the oyster beds and negatively impacting their livelihoods. The initial lawsuits were successful in the lower state courts; however, it was ultimately overturned by the Louisiana Supreme Court and failed in the federal courts. For additional information, visit the project website at https://lacoast.gov/new/Projects/Info.aspx?num=BS-03a

### Canaveral National Seashore Restoration

Canaveral National Seashore is located along the east coast of central Florida in Brevard County. Three historical sites – Turtle Mound shell midden, Eldora State House, and Seminole Rest – are used for a living shoreline stabilization project by University of Central Florida Pegasus Professor Dr. Linda Walters. Her team is working to effectively reduce erosion and increase sediment deposits at rates that are exceeding local sea level rise.

Three zones comprise the shorelines for this project. First, in the upper intertidal zone, her team and countless volunteers have planted red and black mangrove seedlings. Second, in the mid-intertidal zone, smooth cordgrass transplants are planted. Within 6 months of planting the mangroves and cordgrass, the survival rate ranged from 65% to 75% and vegetation cover increased from less than 2% to approximately 47%. Lastly, in the lower intertidal zone, researchers and volunteers installed oyster shell mats to stabilize the shoreline and to recruit live oysters. Within 6 months, the team measured an average of 3.0 cm of sediment accretion, which is a marked change from the 1 cm per month sediment loss captured before the team initiated the restoration project.

The combination of vegetation and oyster mat instillation has not only stabilized the shoreline but has also increased bird, fish, and invertebrate species (such as wood stork, Atlantic salt marsh snakes, and brown and white pelicans) at the three historical sites. For additional information about this project, visit: https://www.nbbd.com/godo/cns/Brochures/oyster_restoration.pdf

## Conclusion

Managing, mitigating, and planning for hazards in a coastal zone requires an interdisciplinary approach using best practices from emergency management, public administration and policy, engineering, environmental management, and urban and regional planning. The effects of human caused and natural hazards are felt locally but are occurring globally. While there have been efforts at all levels of government, a concerted effort is needed at the local government level. Research concludes that state and federal mandates increase the quality of local government planning. Ensuring the inclusion of hazards planning in comprehensive land use planning increases the probability that local decision makers will not plan or build in hazard prone coastal zones. With the increased effects of climate change in coastal zones around the world, researchers and practitioners will continue to study the best ways to manage, mitigate, and plan for hazards in a coastal zone.

# Code of Ethics

James H. Svara
School of Government, University of North Carolina at Chapel Hill, Durham, NC, USA

## Synonyms

Laws; Principles; Standards; Values

The idea of codes is simple, but the utilization of codes in public administration is complex. A code presents a systematic set of standards to be observed. These standards may be based on law and regulations, principles, or the expectations of an organization or group. A code *of ethics* presumably grounds the standards in ethical concepts rather than simple rules of right and wrong, but

that is not necessarily the case. By their nature, codes make explicit what the standards are and more or less clearly link the standards to actions that a public service practitioner should take or not take. A different approach to shaping behavior and providing ethical guidance is to consider the values that should shape behavior and leave to the individual to decide what values are relevant to a situation and what kinds of actions are consistent with the values. For example, public service motivation is based on an attraction to public policy making, a commitment to the public interest, compassion, and self-sacrifice (Perry 1997; Perry and Wise 1990). Values and motivations do not, however, provide standards for behavior. "An ethical principle is a statement concerning the conduct or state of being that is required for the fulfillment of a value; it explicitly links a value with a general mode of action." (Cooper 2012, 21). Codes provide explicit guidance based on principles or requirements for behavior rather than relying on expectations that are implicit in the attitudes of members of a group.

The use of codes in public administration is a multifaceted topic because codes can vary in many respects. It is important to understand the nature of codes, their source, what they cover, and whether or how they are implemented.

## Distinctions in Public Administration Codes of Ethics

Public administration codes of ethics should articulate behaviors that are expected of the public servants covered by the code. The level of these standards may differ. A long-standing criticism of codes is that they are either too specific to be meaningful or too abstract to be a guide to behavior. These alternatives have been called the "low road" and the "high road" to ethics, and both are commonly viewed as ineffective (Rohr 1989, 60–65). Ideally, a code articulates standards that both deter unethical conduct and elevate the level of behavior by asserting positive standards that can be translated into action. A high level code seeks to inspire rather than simply seeking to control.

Another major distinction in public administration codes is whether they are set by law or are developed voluntarily by an organization or association. Legally mandated codes tend to be more narrow and control oriented. Codes of professional associations vary more widely. Some focus on the treatment of persons who are the clients of members of the association and others also include broader statements about impacts on society that they seek to advance. It is likely that professional codes will reflect shared commitments that members of the association have chosen to accept rather than being imposed on them. The "voluntary" nature of their acceptance is somewhat ambiguous when membership in an association is a condition for employment, for example, when employment as a city planner requires certification of membership in the American Institute of Certified Planners. Although most members are likely to be committed to a code that is required to hold a position, it is possible that some members are promoting their self-interest by agreeing to follow the code in order to join the association.

A final general distinction is whether the implementation of the code includes provisions for reviewing the conduct of persons covered by the code and examining complaints that the code has been violated, on the one hand, or relies entirely on self-monitoring. If the organization or association can review conduct and potentially sanction employees or members for violation of the code, there are both potential problems and benefits that can result. The most likely problems arise from too great an emphasis on enforcement with monitoring of the conduct of members that is narrow and intrusive. This approach can produce the negative consequences associated with the "low road" to ethics. Persons covered by the code may focus on avoiding wrongdoing (or evading detection) and not consider what it means to be ethical in a positive way. Not acting unethically is different from acting ethically. The absence of a review process, on the other hand, can contribute to a weakening of the standards as they are left to each person to define what the standards mean and how (and whether) to observe the standards. They offer little guidance in

behavior making them like aspirational codes. Another negative consequence of no review is that the standards may be ignored. In contrast, a positive and reinforcing approach to review encourages the organization or association to define more clearly what it means to be ethical and thereby help to further translate broad principles into action. This approach seeks to balance deterring unethical behavior as well as promoting ethical behavior.

Strict codes that contain primarily prohibitions of specified behaviors or exact specification of expectations associated with the "low road" to ethics may more appropriately be called codes of conduct rather than codes of ethics, but there are no standards for the labels that are applied to codes of different types. Many of the criticisms of codes are directed at codes that have these characteristics particularly when they are accompanied by strict enforcement. Exclusively "high road" codes are also criticized because it is unclear how their aspirational standards can be implemented. These criticisms are magnified when these codes are not linked to a review process. It is possible that codes that include a mix of principled and rule-based standards and include a constructive review process can avoid the shortcomings of the two common approaches to developing codes. It is challenging to devise and implement such codes, but it can be done.

## Development of Codes of Ethics in USA

The USA had limited experience with codes of ethics for public servants prior to the mid-twentieth century. Two exceptions that reflect sharply contrasting approaches to ethics occurred almost a century apart in 1829 and 1924. The Code for US Postal Workers was issued by the postmaster general in the earlier year (Lewis and Gilman 2005, 186). The 1829 code set rules of conduct for postal clerks and specified their work hours (along with the expectation that a clerk would work beyond the normal ending time to finish a task for a patron), what kind of printed material they could read during office hours, and how they should converse with clients. Accepting gifts was prohibited, and clerks could not engage in any employment that would interfere with their service to the public. Strict economy was required in the use of supplies, and clerks were forbidden from taking paper and quills from the office. Relating any information about office business that could harm a citizen was prohibited. Finally, certain behaviors outside of work were prohibited including drunkenness, gambling, or other immoral habits.

Similar to this approach to ethics was the Code of Ethics for Government Service approved in 1958 (United States Senate 2003, 7). The United States Congress set ethics standards prompted by general concerns in the 1950s about the way that government officials related to private contractors and by the abuse of government authority demonstrated by Senator Joseph McCarthy who led "witchhunts" to find and remove communists in government and other areas of American life (Hays and Gleissner 1981). Drawing on a ten-point code first proposed by Representative Edward Bennett in 1951, this code was approved in a resolution by the House of Representatives (with the Senate concurring) in 1958. It applied to all government employees, including elected officials. It advanced beyond the 1829 code with three broad statements of principle:

- Put loyalty to the highest moral principles and to country above loyalty to government persons, party, or department (Arnold and Plant 1994).
- Uphold the constitution, laws, and legal regulations of the USA and of all governments therein and never be a party to their evasion (Bowman 1981).
- Uphold these principles, ever conscious that public office is a public trust (Lewis and Gilman 2005).

Furthermore, it called for finding more efficient and economical ways of getting tasks done and banned discrimination but with specific reference only to giving "special favors or privileges" based on favoritism or in exchange for receiving favors or benefits which were prohibited. The other five points were specific requirements to "give a full

day's labor" and "expose corruption" and to not make private promises, engage in business that is inconsistent with governmental duties, or misuse confidential information (http://usgovinfo.about.com/blethics.htm). This advisory code with no provisions for enforcement combined a few broad aspirational standards with a number of specific requirements similar to the rudimentary standards of 1829. Few other governments immediately followed the example of the Congress by establishing codes of ethics.

An example of a different approach to ethics was developed in 1924 when the young city manager's association issued its own code of ethics. The form of local government that features an executive officer appointed by and responsible to a city council had been originated in the 1908, and the city managers' association was organized in 1914 (ICMA 2014). This code of ethics was a broad and high level statement that served to define the nature of the new administrative role as well as to establish standards for the city manager profession. The manager should serve the community, be exemplary in personal conduct, obey the law, recognize that the council is primarily responsible for determining policy, and insist on maintaining the authority to carry out executive and administrative functions. In addition, the manager should not benefit personally from confidential information or by misuse of public time, serve all residents without discrimination, keep the community informed, deal frankly with the council as a whole, recognize relations to the larger political subdivisions, and not take an active part in politics. Overall, the manager should advance the public interest – "in a far-sighted way aim to benefit the community of today and of posterity." Thus, a small new group of professional administrators developed a code that included some broad responsibilities to society and the public, stated the conditions for filling the position in the new council-manager form of government that should be expected and preserved, and asserted basic standards for personal and public conduct.

The International City-County Management Association code has been revised eight times since the first edition. In 1938, the code stated that managers should be governed by the highest ideals of honor and integrity in all their public and personal relationships. In that same version, the code downplayed the advisory role of the city manager by stating that the manager "is in no sense a political leader" but still recognized that the manager "provides the council with information and advice" and in 1952 asserted once again that the manager "as a community leader submits policy proposals to the council and provides the council with facts and advice on matters of policy." In the same year, the overarching goal of ICMA was expressed as a commitment to achieve effective and democratic local government. Detailed guidelines for interpreting the code were added in 1972, and over time the code has added standards to continually improve professional ability and to develop the competence of members in the use of management techniques, encourage communication between the citizens and all local government officers, emphasize friendly and courteous service to the public, and handle all matters of personnel on the basis of merit. Most recently revised in 2015, the ICMA code began with a broad range of ethical standards and has expanded and clarified them over time.

Despite the example set by ICMA, establishing clear and meaningful standards to guide behavior was slow for other associations made up of practitioners and scholars in the field of public administration in the USA. In time, the creation of codes occurred as professional associations developed in the second half of the twentieth century (Arnold and Plant 1994). In contrast to ICMA's early action, the National Association of Social Workers (2009) adopted its first code of ethics in 1960, 5 years after the association was formed. The American Society of Planning Officials created its first code in 1962, and the affiliated American Institute of Planners established its code in 1971 (Silva 2005, 312). Despite the claim by one of the key organizers of the American Society for Public Administration (Mosher 1938) that a code was a central element in fostering a shared professional consciousness, over 40 years would pass before ASPA approved its first code of ethics in 1984.

There was a surge in ethics activities in the 1970s spurred by the Watergate crisis as well as other ethical scandals in government and business. A survey in 1979 found that 73% of 650 large companies had a code of ethics and that over half had adopted the code since 1975 (Bowman 1981, 61). In governments, only 13 states had adopted codes of ethics prior to 1972 and most had some form of ethics code or law by 1980. The state codes tended to be narrow in scope and negative in orientation with most focused on eliminating conflict of interest and other forms of benefitting inappropriately or misusing their official position (Hays and Gleissner 1981). At that time, only 11 states covered other areas, and these were similar to the specific statements included in the Code of Ethics for Government Service.

In 1978, the Congress passed the Ethics in Government Act and a Presidential Executive Order established the Standards of Ethical Conduct for Employees of the Executive Branch. The standards incorporated all but one of the tenets in the Code of Ethics for Government Service and added statements prohibiting holding "financial interests that conflict with the conscientious performance of duty" and requiring that employees "adhere to all laws and regulations that provide equal opportunity for all Americans." The new Office of Government Ethics developed regulations that gave detailed specification to the standards, particularly the behaviors prohibited in the executive order (Gilman 2005, 18). In addition, there were separate conflict of interest statutes at the federal level that prohibited certain kinds of conduct similar to the controls in state ethics laws. Thus, governmental codes and ethics laws expanded substantially in the 1970s but tended to be low in the level of standards, narrow in focus, and negative in their orientation. Acknowledging that the Code of Ethics for Government Service was little known and largely invisible, the Congress in 1980 required that it be posted in all government offices (Bowman 1981, 61). Thus the federal government and virtually all states were giving more attention to ethics, but the level of expectations was generally low and largely oriented to preventing unethical practices and setting modest standards of behavior along with some aspirational goals. Local governments frequently acted as well – at times required to do so by state law. As of 2012, 86% of local governments responding to a survey by ICMA reported having a code of ethics (ICMA 2012).

C

## Development of a Universal Code of Ethics for Government Administrators

Also prompted by Watergate and the attention to social equity raised by the New Public Administration (Marini 1971), ASPA formed the Professional Standards and Ethics Committee (PSEC) in 1974. Reflecting the concerns of ASPA President Nesta Gallas that adopting a code of ethics could be a symbolic act with little impact on behavior (Ink in Mertins 1979), the committee decided not to create a code of ethics. Rather, it developed a workbook designed to assist members in conducting self-diagnosis of their ethical values and responsibilities. The workbook *Applying Professional Standards and Ethics* was published in 1979 as "only a first step in a long overdue effort to strengthen professional standards and ethics in the public service" (Ink in (Mertins 1979, ii). The authors of the workbook stated in the introduction that "although it is possible to develop a long list of "thou shalts" and "thou shalt nots", as many professions have done, ultimate responsibility for applying standards and ethics still falls on the individual" (Mertins 1979, 1). Thus, the workbook provided a diagnostic approach to help individuals assess their responsibilities and the appropriate response to the challenges they faced as an alternative approach to developing a code.

The topics covered in the workbook were relationships to law, responsibility and accountability, commitment, responsiveness, knowledge and skills, professional development and achievement of potential, citizenship and the political process, conflicts of interest, public disclosure and confidentiality, and professional ethics. Generally, the workbook did not assert value preferences but rather described the topic and explained why it is important. The authors asked questions to clarify the meaning of each area and encouraged readers

to decide for themselves what value commitments to affirm. Thus, ASPA continued to rely on a sense of personal ethical responsibility framed through a process of deliberation and self-assessment.

By the time the handbook was published, however, ASPA was already working on the development of ethical standards. Efforts beginning in 1978 led to the adoption of a statement of principles in 1981 as ASPA's first step in developing ethical standards. The principles concluded with a broad statement that challenged administrators to achieve a high level of ethical commitment: "public administrators are not engaged merely in preventing wrong, but in pursuing right through timely and energetic execution of their responsibilities." Compared to ethics laws prevailing at that time, it was a broad and positive statement although it was intended to assert aspirations and to shape an orientation to ethics rather than being a code that could be applied to guide and judge behavior.

The principles provided the foundation for ASPA's first code of ethics approved in 1984. The code based the practice of public administration on integrity, dedication to the public interest, and respect for the law. It noted the responsibility to "work to improve" constitutions and other laws "when necessary." Many of the tenets focused on aspects of organization and administrative process. Administrators should support colleagues if they are in difficulty because of their efforts to correct organizational abuses. They were expected to seek personal professional excellence and encourage the professional development of others. Although the code used restrained language to describe the roles and responsibilities of administrators, it contained a broad range of responsibilities. In 1985, a set of implementation guidelines that offered commentary on the tenets was adopted by ASPA. For example, the code recognized the responsibility to seek changes in laws "when necessary" and the guidelines called for administrators to recommend changes to superiors or the legislative body "when a law is unenforceable or has become obsolete" (ASPA Code 1984, guideline to tenet 8). The response to the 1984 code was often critical for the lack of clear organization of the standards. Despite the criticisms, the code was an important step toward articulating the full scope of administrators' ethical responsibilities. For ASPA, it was an important accomplishment to fill the void in explicit ethics standards that had persisted since its founding in 1939. Cooper (Cooper 1994), despite describing the code as "a less than excellent document," observed that it had prompted discussion and debate among ASPA members about ethics and "served to institutionalize and legitimize administrative ethics as a significant and useful field of study." It prompted an explosion in ethics research that started in the 1980s.

The 1994 code was a major reorientation of the code that addressed the lack of clear logic in the organization of the 1984 code while incorporating as much of the 1984 version as possible. To improve the coherence of the code and to clarify the normative foundations, the content was organized around five major canons or principles derived from what the committee saw as the major sources of ethics in the public sector (Van Wart 1996). The five principles and thirty-four specific tenets that elaborate them stress the responsibility of administrators to take actions that are consistent with and advance the law, public interest, integrity, and organizational ethics and that develop excellence in oneself and others. The first step toward linking the code to qualifications for ASPA membership was taken by adding a statement at the end of the code that indicates that it will be enforced in accordance with ASPA bylaws that permit the association's National Council to expel a member who appears to have acted in violation of the code of ethics (Article II, Section 5).

In 2013, the ASPA code was revised again adding three principles to the previous five dealing with promoting engagement of citizens, advancing social equity, and fully informing and advising superiors and peers in the organization (Svara 2014). A peer review process for handling complaints was approved in 2014.

## Nature and Content of Codes of Ethics in Professional Associations

The distinctive feature of professional codes is that they express the standards adopted by

members of an association to apply to themselves rather than having standards imposed by an outside authority. The code may express prerogatives claimed by the association or assigned to it. For example, the early city managers asserted that they should advise the city council and protect their administrative authority from incursion by the city council. These codes set standards that protect the reputation of the profession and provide assurance that its members can be trusted to behave properly. This aspect of the code is especially important for associations that formally or informally certify members to hold public offices (Plant 1994). For example, membership in the American Institute for Certified Planners is required for many planning positions in governments. Membership in ICMA is not required in most local governments, but membership is typically expected and an advantage for selection. The code also articulates the commitment of members to values that are important to the profession and express their view of how they can contribute to the governmental process. Professions that have extensive interaction with clients set the standards that apply to the professional–client relationship. The issue of implementation of professional codes will be examined further later in the discussion, but it is important to note that these purposes of professional codes presume that there will be a formal process within the profession for examining instances of conduct that do not meet the code of ethics.

To illustrate the scope of ethical standards that have been developed by professional associations, the codes of three associations will be compared: the American Society of Public Administration, the American Institute of Certified Planners (AICP), and the National Association of Social Workers (NASW). The organizations differ in their degree of specialization and the extent to which ethical standards focus on clients. Public administrators in ASPA deal with all aspects of the formulation of public policies, the implementation of laws and delivery of services, and the management of public resources. Public administrators work under the direction of elected officials or governing boards and work for the persons in the society they serve. Planners in AICP address policy issues related to the arrangement and development of the physical assets that support human activity and the impact of physical developments on the natural environment. They usually work for a government but may use their planning expertise under the direction of a client who pays for their services. Social workers provide direct services that have been authorized by law or are supported by private fund-raising. They work in public or private service agencies and work for their agencies to provide services and assistance to persons in need.

The three codes differ in their length and organization. ASPA has a code consisting of nine principles and a supporting statement of practices to guide implementation of the code (www.aspanet.org/CodeofEthics). AICP divides its code into two sections (https://www.planning.org/ethics/ethicscode.htm). The first is a statement of "Principles to Which We Aspire" consisting of four sections containing responsibilities to the public, clients and employers, and the profession and colleagues. The second section contains 26 rules of conduct – many of them prohibitions – which are the basis for review and disciplinary action. The elaborate and comprehensive ethics statement from NASW starts with a discussion of ethical values and principles and then develops in detail six sections of ethical standards with over 51 separate standards (https://www.socialworkers.org/pubs/code/default.asp). Despite these differences in organization and length, the codes can be compared in four areas: the way they treat the fundamental duties of members, the standards guiding the members' key relationships, the personal qualities expected of members, and the responsibilities of members in a number of settings.

The codes address *fundamental duties* that members should uphold. For ASPA, members are expected to "promote the public interest [and] seek to advance the good of the public as a whole, taking into account current and long-term interests of the society" [1a]. AICP states that "our primary obligation is to serve the public interest" (Arnold and Plant 1994) and that members should "promote excellence of design and endeavor to conserve and preserve the integrity and heritage of the natural and built environment" [A1g]. NASW calls on members to "promote the general welfare of society. . .and the development of people, their

communities, and their environments" [6.01]. In addition, social workers should "advocate for living conditions conducive to the fulfillment of basic human needs and should promote... social, economic, political, and cultural values and institutions that are compatible with the realization of social justice" [6.01].

Another fundamental duty is serving the public. ASPA members should "put service to the public above service to oneself" (Arnold and Plant 1994) and "subordinate personal interests and institutional loyalties to the public good" [1d]. AICP members "owe diligent, creative, and competent performance of the work we do in pursuit of our client or employer's interest... [if] consistent with our faithful service to the public interest" [A2]. NASW states the ethical principle that "social workers' primary goal is to help people in need and to address social problems." Like members of ASPA, "social workers elevate service to others above self-interest" [Ethical Principle Service].

A third fundamental duty is to uphold the law. To ASPA, this means that members should "respect and support government constitutions and laws, while seeking to improve laws and policies to promote the public good" (Bowman 1981). They are also expected to "develop proposals for sound laws and policies and for improving or eliminating laws and policies that are unethical, counterproductive, or obsolete" [2c]. AICP makes somewhat peripheral references to avoiding "private communications... prohibited by law" [B8], engaging in "private discussions with decision makers...in any manner prohibited by law" [B9], or accepting "an assignment...when the services to be performed involve conduct that we know to be illegal" [B2]. Social workers "should advocate for changes in policy and legislation to improve social conditions in order to meet basic human needs and promote social justice" [6.04a].

Ethics codes provide standards *guiding relationships* with citizens, with the society, and with superiors and peers. Regarding citizens, ASPA asserts that public administrators should "promote democratic participation" in these ways: "inform the public and encourage active engagement in governance; be open, transparent and responsive, and respect and assist all persons in their dealings with public organizations" (Cooper 1994). Specific practices to promote engagement of citizens in the governmental process are also elaborated. Planners should "provide information to all affected persons" [A1d] and "give people the opportunity to have a meaningful impact on the development of plans and programs that may affect them" [A1e]. Social workers should "facilitate informed participation by the public in shaping social policies and institutions" [6.02].

In the relationship to the society, administrators should not ignore or passively accept fundamental disparities among social groups. Public administrators seek to "strengthen social equity: treat all persons with fairness, justice, and equality" and "promote affirmative action and other initiatives to reduce unfairness, injustice, and inequality in society" (Cooper 2012). They should "provide services to the public with impartiality and consistency, ...ensure that all persons have access to programs and services to which they are entitled under the law" [4a], and "provide equal treatment, protection, and due process to all persons" [4b]. AICP asserts two principles to "seek social justice by working to expand choice and opportunity for all persons" [A1f] and to "not unlawfully discriminate against another person" [B20]. NASW has extensive provisions to advance their relationship to society. A core ethical principle is that "social workers challenge social injustice," and they are expected to "pursue social change, particularly with and on behalf of vulnerable and oppressed individuals and groups of people" with a focus on poverty, unemployment, discrimination, and other forms of social injustice. Social workers should engage in social and political action to "ensure that all people have equal access to the resources, employment, services, and opportunities," "to expand choice and opportunity for all people," and "to prevent and eliminate domination of, exploitation of, and discrimination against any person, group, or class" [6.04].

Administrators also should meet standards in their relationship to their superiors and to peers within the organization. In the ASPA code, they are expected to "fully inform and advise" and

"provide accurate, honest, comprehensive, and timely information and advice to elected and appointed officials and governing board members, and to staff members in your organization" (Gilman 2005) that is "based on a complete and impartial review of circumstances and needs of the public and the goals and objectives of the organization" [5a]. Similarly, planners should "provide timely, adequate, clear, and accurate information on planning issues... to governmental decision makers" [A1d]. In their "commitments to employers," social workers should work to improve employing agencies' policies and procedures and the efficiency and effectiveness of their services [3.09b].

The codes identify the *personal qualities* that members should have and all expect members to demonstrate personal integrity and to avoid conflicts of interest. ASPA calls for members to "resist political, organizational, and personal pressures to compromise ethical integrity and principles and support others who are subject to these pressures" [6c, 6e, and 6g], "guard against using public position for personal gain or to advance personal or private interests" [5e], and carry out "official acts without partisanship or favoritism" [5 g]. Planners should "deal fairly with all participants in the planning process" [A1h] and "not solicit prospective clients or employment through use of false or misleading claims" [B11]. A core ethical principle of social workers is that they should "behave in a trustworthy manner" and "act honestly and responsibly and promote ethical practices."

The final element of codes is to elaborate the *responsibilities* of members in their dealings with clients, their organization, and their profession. The ASPA code contains no explicit standards for interactions with clients beyond the general obligation to "serve all persons with courtesy, respect, and dedication to high standards" [1e]. AICP instructs planners to avoid conflicts of interest in accepting assignments from clients or employers [A2c] and not accept work that cannot be performed in timely and suitable way [B16] or if it contradicts work performed for other clients [B3]. NASW has detailed standards regarding support for and treatment of clients. They spell out the broad standards that the "primary responsibility" of social workers "is to promote the wellbeing of clients" [1.01], and they should "respect and promote the right of clients to self-determination" [1.02].

Responsibilities to the organization are elaborated extensively in the ASPA code. Public administrators should "promote ethical organizations" (ICMA 2012). Practices include strengthening accountability [7a], acting as stewards of public resources [7b], encouraging open expression of views by staff members and providing administrative channels for dissent as well as protecting the whistleblowing rights of employees [7c], taking individual responsibility to correct instances of wrongdoing or report them to superiors [7d], supporting merit principles [7f], and promoting "proactive efforts to increase the representativeness of the public workforce and the full inclusion of persons with diverse characteristics" [7g]. AICP does not address the organizational context directly, but members are expected to "increase the opportunities for members of underrepresented groups to become professional planners and help them advance in the profession" [A3g]. NASW elaborates the responsibilities of social workers in filling administrative roles as supervisors [3.01] and evaluators of performance [3.03]. Administrators should seek "to ensure that the working environment for which they are responsible is consistent with and encourages compliance with the *NASW Code of Ethics*" [3.07]. They should seek to improve efficiency and effectiveness of their services, prevent and eliminate discrimination in the organization, and be "diligent stewards" of the resources used by their organization [3.09].

Finally, there are responsibilities to the profession represented by the association. To meet the principle of advancing professional excellence, public administrators should "strengthen personal capabilities to act competently and ethically and encourage the professional development of others" (ICMA 2014). Individually, they should keep current on emerging issues and practices and provide support of others to "upgrade competence and participate in professional activities and associations" with special attention to students and

beginning professionals. Planners are expected to "protect and enhance the integrity of our profession" [A3a], "contribute time and resources to the professional development of students, interns, beginning professionals, and other colleagues," [A3f] and "continue to enhance our professional education and training" [A3h]. Social workers should uphold the "integrity of the profession" by promoting "high standards of practice" [5.01]. They should "practice within their areas of competence and develop and enhance their professional expertise." They should "strive to become and remain proficient in professional practice" and "critically examine and keep current with emerging knowledge relevant to social work" [4.01b].

The similarities across these three codes reflect a broad consensus about the standards that professionals in public service should seek to meet and advance. These codes identify some kinds of conduct that are not acceptable but greater emphasis is given to a broad range of positive contributions that professionals are expected to make. Not all professional codes match the quality of these three codes, but there is no longer any question that professional codes can provide challenging and public-serving standards of behavior for public professionals.

## Implementation and Enforcement

The impact of codes of ethics depends not only on their content but also the nature of their implementation. A code without a process for reviewing the conduct of persons covered by the code is "just words" (Gilman 2005, 16). At the other end of the spectrum, a specific code with a negative orientation may be implemented with an enforcement process that stresses exposure and punishment. This combination also has negative consequences. Being "ethical" is equated with not violating the rules rather than advancing positive ethical standards. The difference in the approach to implementation approximates the division often found between an emphasis on enforcement in government and implementation supported by peer review and encouragement of ethical practice in professional associations. Still, exceptions are common. Some government codes lack any enforcement process – for example, the Code of Ethics of Government Service – and some associations can enforce their code by imposing serious sanctions such as denial of the right to practice the profession. In addition, some professional associations lack any review process and leave to members the interpretation and implementation of the code. In this situation whether in a government or association, the code can be peripheral to practice or ignored by members.

Professions must choose how much scrutiny they will provide and what kind of actions they will take when members fail to abide by the code. To prompt review activities, they usually rely on receiving a complaint about a member's action that appears to violate the code of the association. In contrast, some governmental ethics boards may receive reports about financial holdings from all staff members and identify possible violations of conflict of interest statutes through their review of these records. After examining a complaint that is received, the association may have provisions for communicating privately with the member to suggest approaches that are in line with the code or to express disapproval of behavior when warranted by the information obtained. Furthermore, the association may provide for more substantial penalties. Although sanctions that range from public disapproval of the member's actions to removal from the association may be imposed, most associations "regard the code of ethics as an enabling rather than an intimidating medium of influence. And they exert every effort possible at all levels of their occupational association to implement the code rather than enforce it" (Levy 1974, 208). To Levy, this broad approach to implementation rather than focusing on enforcement indicates a reliance on "group influence rather than on group pressure" to promote adherence to the code.

ASPA has faced a challenge in determining its approach to ethics because of the wide range of positions covering all levels of government and both practitioner and academic positions among its members. In addition, ASPA membership is not a condition for employment, and ASPA does not certify its members. There has been discussion

since its founding in 1939 of the question whether ASPA is intended to advance the professional qualities of individuals in public administration by promoting research, education, and networking or to lead a profession of public administrators with clear standards of ethical behavior. During its early decades, ASPA chose to focus on promoting professionalism among its members instead of viewing itself as a profession of public administration (Pugh 1988, 3; Pugh 1989). After a code was finally adopted in ASPA in 1984 and especially after its revision in 1994, the issue about whether a process to enforce the code arose occasionally but was not resolved until 2014.

Since 1994, the ASPA National Council has had the authority to remove a person from membership who has violated the code of ethics, but it has not had a process for reviewing ethics complaints or providing any kind of corrective action other than expulsion and no members have ever been removed (Menzel 2010, 122). In 2014, ASPA members approved bylaws changes that created a peer review and established the Ethics and Standards Implementation Committee to handle it. If a complaint is submitted to ASPA, the Committee will communicate with the member and, when appropriate, offer constructive advice about how the member might more meaningfully and effectively meet the standards. If there is evidence of a serious violation of the code, the Committee can request permission from the National Council to conduct an investigation of a member and recommend action that should be taken based on the investigation. The Council holds a hearing at which the member could be present before deciding what action to take.

Other associations such as ICMA and AICP have provisions for investigating every complaint about conduct that would be a violation of the code if substantiated by evidence.

ICMA appoints a fact-finding committee that presents the information it has collected to the Committee on Professional Conduct that decides whether a public sanction should be recommended to the Executive Committee. In AICP, the ethics officer may designate a member of the AICP staff or AICP counsel to conduct an investigation. The results of the investigation determine whether the ethics officer drafts a formal complaint that is sent to the member. A hearing is held by the Ethics Committee that determines whether a violation of the standards has occurred and what the sanction will be if the complaint is upheld – either a reprimand, suspension, or expulsion.

NASW has the most elaborate review process. The association advises persons who are considering making a complaint – called a request for professional review (RPR) – that they may request a consultant to assist them in the preparation of their RPR. The consultant will provide assistance in preparing the initial request and offer technical assistance to the complainant throughout the professional review process. A subcommittee of the National Ethics Committee reviews the RPR initially to determine whether the criteria for accepting the request have been met and, if so, whether it should be mediated to resolve a dispute or adjudicated to determine whether a member's action was a violation of the code. If a violation is found, a variety of responses is possible from mandating corrective actions on the part of the member to public sanctions, including public notice of the violation, suspension of membership or expulsion from membership in NASW, or suspension of standing as a certified social worker. The member may request a removal of sanctions after a specified period of time or after completing the mandated corrective actions.

## Conclusion

Codes of ethics have a similar purpose but they seek to enhance ethical behavior in different ways. The typical approach that has commonly been used when a code of ethics is adopted by a government is to focus on prohibiting certain kinds of unethical behavior and to link the code to an enforcement process that stresses penalties for violations. The usage of such codes has greatly increased in governments, but the approach to promoting ethics has remained fairly constant. In professional associations, on the other hand, there has also been an expansion in the use of codes of ethics, but the level of the ethical standards has

risen and expanded over time as well. The focus has been on broad approaches to implementation rather than an emphasis on enforcement alone. A possible approach to future action to promote ethical behavior is linking more closely professional codes of ethics with the expectations of public organizations through a combined approach to training and professional development of staff.

Codes of ethics can be narrow and "negative" with a specification of what administrators should not do, or they can define precisely what administrators should do. Both approaches stress compliance and are particularly common in codes of ethics approved by governments. Professional codes of ethics have increasingly tended to articulate standards that require thought and commitment on the part of members of the association to meet. Many also have a process for examining the conduct of members if complaints are received that they have engaged in conduct that does not comply with the code. Without a review process, these professional codes can be aspirations that members might strive to attain or might ignore. At their best, these ethical standards are expectations that reflect the shared commitment of the members of an association who work together to implement them and review the conduct of members when they fail to meet their shared standards. These codes do not provide simple instructions. Members must be committed individually and engaged collectively to implement the code.

## Synonyms

Collaboration; Governance; Hollow-state; Networks; Third-party government

## Definition

Collaboration is a strategic response to changes in environmental conditions. Collaboration is a joint activity by two or more organizations intended to create public value by working together rather than separately. It is a governance strategy used to achieve direction, control, and coordination of individuals and organizations with varying degrees of autonomy to advance or pursue joint objectives. It involves more than the configuration or network of public and private organizations. Collaboration can involve formal agreement between parties, pooling of organizational and financial resources, creating and observing administrative rules, routines, and structure to facilitate and coordinate joint action. Therefore, collaboration is relational and political and involves bargaining, negotiation, and compromise.

## Introduction

Although the study of collaboration as a governance strategy has become ubiquitous over the last two decades, government has collaborated with nongovernmental partners to produce and deliver public goods and services for much longer. Governments collaborated with public and nongovernmental partners to address public health problems stemming from contaminated drinking water and poor sewage treatment in the late 1800s. Public works projects initiated by the "New Deal" during the Great Depression routinely involved collaborations among various government and private sector entities. Efforts to support the home front during World War II prompted many collaborative efforts involving partnerships between the public and nonprofit sectors. Indeed, the "Great Society" programs of the 1960s highlighted the necessity of using collaboration to deliver public goods and services.

The emergence of collaboration as a common strategy for delivering public goods and services is a product of two primary factors. First, government at all levels continues to assume greater responsibility for addressing various social, economic, and environmental issues. However, any single government entity is often constrained by its ability to address these new issues directly. Although citizens have engineered the drive toward government's enlarged role in tackling a variety of issues, they also maintain a healthy disdain for "big government." The popular view of government bureaucracies as lumbering, inefficient, unresponsive, and laden with "red tape" led to increased calls for the devolution of publicly delivered goods and services to private-sector actors. Therefore, governments have been asked to do more, but with fewer resources and through indirect means. In response to these demands, governmental entities increasingly collaborate with nongovernmental actors to deliver goods and services. This model of indirect government provision is commonly referred to as "third-party government."

The second reason government turns to collaboration as a means for delivering vital public goods and services is the recognition that many of the problems it faces are too complex and/or large to address independently. Hurricanes strike without regard to geographic boundaries and care little for governmental jurisdictions. Disaster management requires intergovernmental and interorganizational collaboration at each stage – mitigation, preparedness, response, recovery – to protect citizens and minimize loss. Likewise, homelessness is driven by countless causes (e.g., loss of job, divorce, spousal abuse, illiteracy, drug

or alcohol addiction, mental health issues) and requires various solutions to reduce its prevalence (e.g., job training, education, counseling, temporary housing services). These so-called "wicked problems" typically require joint action from a diverse set of public and private sector actors; no single governmental entity possesses the resources, such as funds, authority, staff, expertise, to address all aspects of the problem.

Despite this trend toward increased governmental collaboration and its myriad benefits, collaboration is not a panacea. Collaboration, not unlike bureaucracy, is simply one form of organizing people and resources to achieve a desired end. Done right, collaboration can create synergies and yield public and mutual benefit. However, collaboration is difficult to achieve and is just as likely to lead to failure as independent (i.e., direct bureaucratic) action. Various contextual and environmental factors affect how and when collaborations succeed, which suggests that collaboration should only be used as a strategy for delivering public goods and services after careful consideration.

This chapter briefly discusses the roots of government collaboration in the United States and then identifies a set of factors that help determine whether it is appropriate to go it alone and use traditional governmental service delivery or invest in collaborative approaches. The chapter then examines the role contextual and environmental factors play in promoting or inhibiting collaboration. The chapter concludes with guidance to public managers contemplating the strategic choice to collaborate.

## Collaboration as a Governance Strategy

Third-party government refers to the shift in the production and delivery of public goods and services from direct government provision to indirect means through the use of nongovernmental actors. The rise of third-party government is usually attributed to the growth of the "Welfare State," where government took on greater responsibility for public problems (Agranoff 2003). This expansion resulted in significant increases in government social welfare spending and assistance in the fields of health, social services, housing, education, and employment training (Salamon 1993). Although government assumed greater responsibility for addressing complex social problems, political, organizational, and economic forces have led governments to avoid direct service provision in favor of collaborating with private-sector actors to provide services. "Philosophically, policy makers are enacting decisions that not only restrict but in many cases remove government from providing services directly to citizens. In part, this is being driven by market and political ideologies that have their roots in perceptions about greater efficiencies and innovations arising from the private sector and broad support for smaller government" (Van Slyke 2007, p. 157).

The devolution of service delivery to third parties goes beyond the delegation of clearly defined duties and exhibits a sharing of governmental discretion and authority with third-party actors. Some observers refer to this trend as a shift from *government* to *governance*. "The essence of governance is its focus on governing mechanisms (grants, contracts, and agreements) that do not rest solely on the authority and sanctions of government. These mechanisms or tools are used to connect networks of actors, who operate in various domains of public policy such as child welfare, health, or economic development" (Milward and Provan 2000, p. 360).

### Government Versus Governance

Public managers and the politicians to whom they are responsible face two options when considering how best to produce and deliver a public good or service. Option one, *government*, is reliant on traditional intraorganizational bureaucratic approaches. This default option is often derided, given the popular conception that bureaucracies are inefficient and ineffective. Although these criticisms may sometimes be warranted, it is facile to assume that the bureaucratic form of organization is the cause of these problems. Bureaucracies remain the dominant organizational form and an essential mechanism for the delivery of a wide range of public goods and services. When used

appropriately, bureaucracies are highly efficient and effective.

The second option, *governance*, involves interorganizational approaches among public and private actors to produce and deliver public goods and services. Indeed "every major policy initiative launched by the federal government since World War II – including Medicare and Medicaid, environmental cleanup and restoration, antipoverty programs and job training, interstate highways, and sewage treatment plants – has been managed through public-private partnerships" (Kettl 1993, p. 4). Governance may take many forms (e.g., contracting, grants, vouchers, loans, regulation). This chapter focuses on one governance approach: collaboration.

### Collaborate to Deliver Services and Increase Public Value

Over the last few decades, the curriculum in graduate public affairs programs continues to expand and now recognizes the role nonprofits play in service delivery, and courses built around collaboration and interorganizational management are increasingly common. However, the traditional core of many graduate programs remains organized around the basic POSDCORB model proposed by Luther Gulick in 1937 (POSDCORB represents the various functional elements of a chief executive's job, including: planning, organizing, staffing, directing, coordinating, reporting, and budgeting). The endurance of POSDCORB and various derivative management models in public affairs programs mirrors the prevalent use of bureaucracies to produce and deliver public goods and services. Bureaucracies remain the prevailing organizing strategy for addressing traditional market failures and confronting a wide range of public challenges.

Despite the long history of employing collaborations that address public challenges, much less scholarship is devoted to the use of collaborations. Scholars submit that collaboration practice is generally ahead of collaboration scholarship (Bryson, Crosby, and Stone 2016). In fact, the literature lacks a commonly agreed upon definition of collaboration (Prentice and Brudney 2016). This chapter defines collaboration broadly as any joint activity by two or more organizations intended to create public value by working together rather than separately (Bardach 1998; Imperial 2005).

This definition takes a strategic view of collaboration. From this perspective, collaborations should not be formed based on normative arguments that this governance form is more "democratic" or "participatory" than direct government provision. Rather, collaboration should be used only when it provides the means to generate greater public value than can be achieved by going it alone (i.e., relying on traditional bureaucracy). Collaboration is a means for achieving direction, control, and coordination of individuals and organizations with varying degrees of autonomy to advance joint objectives (Lynn et al. 2000). It involves more than the configuration or network of public and private organizations. Collaboration involves formal agreement between parties, pooling of organizational and financial resources, creating and observing administrative rules, routines, and structure to facilitate and coordinate action. Collaboration is also relational and political and involves bargaining, negotiation, and compromise. Delivering goods and services using collaborative arrangements is fraught with difficulty and challenges. Thus, determining whether to use traditional bureaucratic or collaborative forms of organization should be framed as a strategic choice.

## Collaborate or Go It Alone?

The decision to collaborate or go it alone is complicated and reflects a series of interrelated choices. Table 1 presents a summary of seven factors – problem, solutions, information, resources, objectives, decision making, environment – that public managers may consider in making the decision to go it alone (bureaucracy) or partner (collaborate). Notably, these factors illustrate that the decision to collaborate or go it alone does not occur in a vacuum, and the choice is shaped by opportunities and constraints in the environment.

**Collaboration and the Environment, Table 1** Deciding between bureaucracy and collaboration

| | Bureaucracy | Collaboration |
|---|---|---|
| **Problem** | Problem is narrow, simple<br>Well-understood problem<br>Problem is clear responsibility of government | Wicked problem (i.e., complex issue)<br>Poorly understood problem, lack of agreement on causes<br>Many organizations consider problem as part of their turf/domain |
| **Solutions** | Well defined and easy to deploy solutions<br>Broad agreement on how best to approach problem<br>Previous experience implementing the solution and scope of change is low<br>Possess the authority to implement the solution | Innovative, new, or customized approaches are needed<br>Lack of agreement on how to solve problems<br>Many approaches are available to solve problem but are widely dispersed<br>Authority to implement solution is widely dispersed |
| **Resources** | Resources to address problem are available in-house or are easily attainable<br>Narrow range of resources are needed to solve problem<br>Available resources are sufficient to address problem | Resources to address problem are widely dispersed<br>Wide range of resources needed to solve problem<br>No organization has sufficient resources to solve problem, requires leveraging/pooling existing resources |
| **Information** | Knowledge/expertise is readily available and easy to acquire<br>Minimal information asymmetries<br>Previous experience addressing the problem, institutional memory is retained | Knowledge and expertise is widely dispersed and needs to be acquired, developed, or synthesized from different sources<br>No or minimal experience addressing the problem |
| **Objectives** | Retain hierarchical control<br>Protect turf<br>Maintain accountability to politicians and citizens<br>Ensure reliable production of goods and services<br>Achieve efficiencies by standardizing production and delivery process<br>Ensure equity by providing standardized goods and service<br>Desire for more control by politicians or political appointees | Share control and coordinate activities among different organizations<br>Share or expand turf<br>Ensure accountability to partners and clients of goods and services produced by the collaboration<br>Produce goods and services that currently are not provided<br>Provide differentiated and specialized goods and services<br>Desire for more control by technocrats<br>Desire for negotiation and compromise |
| **Decision Making** | Centralized<br>Control<br>Tightly coupled<br>Norms of responsiveness and efficiency<br>Unilateral | Networked and shared<br>Coordination<br>Loosely coupled<br>Norms or reciprocity and reputation<br>Interdependent |
| **Environment** | Political pressure (e.g., politicians view government as the solution)<br>Political and technological environments are stable<br>Conflict surrounding problem is low<br>Urgency for action is high<br>Thin market for partners<br>Community/citizen preferences for direct service | Political pressure (e.g., politicians view government as the problem)<br>Political and technological environments are unstable<br>Conflict surrounding problem is high<br>Urgency for action is low<br>Competitive and robust market for partners<br>Community/citizen preferences for indirect service |

### Bureaucracy Is a Good Idea When . . .

Some situations are more amenable to going it alone. Traditional bureaucratic approaches are preferred when a problem is easy to understand, responsibility falls securely within the domain of government, the scope of required change is relatively low, information needed to address the problem is known, and the resources (e.g.,

funding, staff, technology, authority) are readily available or easily acquired. Additionally, when solutions are well defined, easy to deploy, and the scope of change is relatively low, it may also be wise to forego collaborative processes and go it alone.

Organizational preferences and objectives will likewise influence the choice to go it alone. For instance, if government is concerned with protecting turf, asserting control over how activities occur, ensuring that the resulting program delivers a relatively standardized set of goods or services in an equitable, predictable, and reliable manner over a relatively long period, then traditional bureaucratic forms are preferred. Additionally, government may choose to deliver goods and services directly where productive efficiencies – obtained through specialization, implementation of clear technologies, and routinization – are achievable.

### Collaboration May Be a Good Idea When . . .

When public managers are confronted with wicked problems, where problem framing is difficult, the causes of the problem are diverse and extensive, and solutions are varied, collaboration may be the preferred approach. In these instances, government lacks the capacity or willingness to implement viable and comprehensive solutions to tackle these complex problems. In these problem domains turf is often shared, expertise and resources are widely dispersed among public and private actors, and new solutions are required.

Although some problems can be addressed using a narrow range of resources, others require the application of a wide range of resources that may not be located within the control of a single organization. In such instances, a public manager must consider how to share and leverage resources from multiple sources to get things done. Unlike bureaucratic approaches that rely on managerial control, collaborations rely on collective influence to acquire, compile, and synthesize information, expertise, and resources from a collective of sources to produce and deliver public goods and services. Although this organic and collaborative form of organizing may reduce productive efficiency by introducing unnecessary partners or processes to the mix, coordination may also improve the productive efficiency of existing resource use by reducing unnecessary duplication of effort and allowing partners to deliver more specialized or differentiated goods and services than is possible when working alone. Further, collaboration offers the potential for greater allocative efficiency and provides political cover to the public manager, who can blame other actors if the collaboration fails to deliver the desired public good or service.

Working together often requires de-emphasizing self-interest maximization and emphasizing mutuality, reciprocity, and trust. Thus, decision-making is loosely coupled and interdependent and is achieved through negotiation and compromise. Where public managers are able and willing to share turf and relinquish bureaucratic control, collaboration can yield new or innovative approaches to address complex problems.

### Influence of Environment on Strategic Choice

Organizations that ignore the environment do so at their own peril – no person is an island. Various environmental factors influence government's ability to produce and deliver public goods and services, directly and indirectly. Among the environmental factors that public managers must consider when making their strategic decision to go it alone or collaborate are political preferences, the urgency for action, the market for partners, and citizen and client preferences.

As noted in Table 1, the environment shapes the strategic choice to collaborate or to go it alone in significant ways. For example, centralized, bureaucratic approaches tend to be more responsive and accountable to political pressures, which provides elected officials with a greater level of control over the scope and substance of these programs. Accordingly, when the political environment is relatively stable and the level of conflict surrounding the problem is relatively low, it may be wise to go it alone.

Conversely, when the political environment is unstable, the level of conflict surrounding a problem is high (or it is a controversial issue), then collaborative approaches provide some measure

of risk avoidance for politicians and public agencies. In such circumstances, sharing turf, allowing technocrats from various organizations to control the process, and making more diffuse any single entity's level of responsibility, offers a measure of political cover. By spreading responsibility, public managers may reduce the potential deleterious effects (e.g., reduction in budget) if the good or service is deemed inadequate or inappropriate.

Despite the outsized impact the environment has on the decision to collaborate or not, environmental variables should not be viewed as predictive. No particular conditions will inexorably lead to one strategic choice over another. Collaboration is not the product of a deterministic process whereby some set of environmental conditions necessitates collaboration, while another set requires that organizations go it alone. Rather, environmental conditions create situations that suggest that the use of collaboration as a governance strategy may be more or less appropriate. Even when favorable conditions exist, collaboration may not be a wise choice. Collaboration can be a risky strategy that requires that slack resources are available to invest in a collaborative process, thereby giving the partnership time to evolve to the point where it gets things done (Imperial, et al. 2016a). Due to differences in problem definition and scope, available resources, politics of the moment, and the values and experiences of particular public managers that shape their objectives and preferences, even in the same geographic location the choice to collaborate may vary across service areas (Brudney, Prentice, and Harris 2017).

Collaboration is also a relational enterprise. Even if it makes sense to pursue a collaboration based on a situational analysis of internal competencies and external opportunities, one still needs to find partner organizations willing to work together towards a joint purpose. Some service areas are relatively dense (e.g., social services), with many potential partners able and willing to collaborate. Other service areas (e.g., mental health) may have relatively few. Some actors are centrally located within a network and interact with many potential partners on a regular basis, thereby offering an accessibility advantage and increasing their knowledge of the market for collaboration. Other actors are located on peripheral nodes with far fewer interactions with network members. Further, not all collaborations are voluntary; they are sometimes mandated by a higher-level authority or as condition of receiving funding. These conditions likely affect actors' motivation and objectives for the collaborative effort.

## The Collaborative Challenge

Table 1 provides a set of factors that help managers determine how to organize when faced with new challenges. Once the decision to collaborate is made, a number of challenges remain before this organizational form can deliver public goods and services. Collaboration requires a speculative investment in a collaborative process. Someone needs to invest time and take the lead to bring together potential partners and discuss how, and to what extent, they may be able to work together.

Greater collaboration does not necessarily yield better results. Partners must determine how to collaborate, and to what extent they should collaborate to ensure that the breadth and depth of this joint enterprise achieves desired ends. Sometimes this process is facilitated by trust and prior relationships among a subset of the potential members. In other cases it requires building working relationships while exploring the feasibility of joint action. Regardless, it may take a considerable amount of time for the partnership to begin producing results that generate public value (Imperial et al. 2016a). Accordingly, collaboration requires some measure of risk because potential members must make a speculative investment of their resources (e.g., staff time, financial resources, political capital) based on the expectation that these costs will be offset by future public value generated by the partnership.

It also matters who your partners are and how many there are. To avoid incurring greater cost

and the loss of efficiency, collaborations should include only the optimal partners needed to get the work done. No evidence exists to suggest that more partners produce better results. As the range of partners increases, transaction costs go up. Although potential partners bring with them a collection of resources than can benefit the collaborative endeavor, they also bring a set of constraints on joint action due to competing values, interests, goals, constituencies, and even legislative mandates. Thus, finding the right mix of partners is important to produce the desired results.

The different responses noted in Table 1 also require different individual skill sets. Managing bureaucratic programs requires a different set of skills than is needed in a collaborative enterprise. Successful collaborations require having the right people with the appropriate skills and abilities necessary to work effectively in a collaborative setting. Prior collaborative experience is essential to future collaborative success. Participants learn how to collaborate by collaborating. Prior experience helps public managers identify potential partners and learn with whom to work in the partner organization. This collaborative know-how can help public managers identify potential partners, reduce tensions, increase trust, and decrease wasted time, effort, and resources.

Finally, collaborative partnerships, which often form in response to opportunities created by environmental changes, also need to adapt and change as they mature or their useful life is diminished. With changing circumstances, it is essential to recreate, reconfigure, or terminate the partnership so that the collaboration's resources can be redeployed to new purposes (Imperial et al. 2016b).

## Conclusion and Lessons for Practice

The strategic choice to go it alone or to collaborate to deliver public goods and services is complex and highly contextual. No prescribed circumstances, service areas, or environmental conditions suggest a "correct" choice. The choice involves various value-based judgments related to efficiency, equity, accountability, responsiveness, and public benefit. Confronted with identical problems, one municipality may choose a bureaucratic response and another may pursue a collaborative response, and both approaches may prove successful, depending on one's definition of public value and preference for particular outcomes. These value-based considerations prohibit "one best way" or "one-size-fits-all" thinking or prescriptions. Nevertheless, despite the highly contextual and individualized nature of the decision-making process, some general factors can be weighed and considered. Public managers can use the elements in Table 1 as strategy screens when weighing whether to collaborate.

The choice regarding whether to collaborate should also include a consideration regarding *how* one might collaborate. Table 2 enumerates many of the common tools managers employ to get things done and generate public value. For example, if the necessary resources are in short supply, partners may develop collaborative arrangements designed to share staff, equipment, facilities, or funding. If disagreement exists regarding how to frame problems or solutions, partners may set shared goals or priorities or establish shared performance measures or outcomes to coordinate actions of actors both inside and outside the collaboration. Collaborations can also be crafted with varying levels of commitment or trust. When collaborations are mandated or begin as an exercise in cooperation among strangers, partners may develop formal contracts or agreements that specify how these processes occur to facilitate this cooperation and ensure mutual benefit.

The use of the tools listed in Table 2 can and should vary based on the nature of a collaboration's joint activity and the type of public value it seeks to produce. More is not necessarily "better" when it comes to collaboration. Managers should only use those tools needed to get the job done. It is imperative to evaluate collaboration with the

**Collaboration and the Environment, Table 2** Common collaboration tools

| Tool | Collaborative activity |
|---|---|
| Facilities | Partners share facilities |
| Equipment | Partners share equipment or technology |
| Staff | Partners share staff |
| Funding | Partners share funding |
| Programming | Partners share programming |
| Measurable outcomes | Develop shared, measurable performance outcomes |
| Contract | Sign a contract or memorandum of understanding |
| Decision making | Partners share decision making |
| Power | Partners share power |
| Goals/mission | Partners develop shared goals/ mission orientation |
| Trust | Partners share high trust in one another |
| Commitment | Partners are fully committed to collaboration |
| Information | Partners share information with one another |

same critical lens used for bureaucracy. Politicians, public managers, and the public are united in their disdain for bureaucratic waste; so too should they be wary of wasteful collaborative enterprises that use the tools in Table 2 unnecessarily or with limited effect.

This chapter also demonstrates that direct (bureaucracy) and indirect (collaboration) mechanisms for service provision offer various benefits (and costs) that public managers may consider when deciding how best to produce and deliver a good or service. This analysis offers several important lessons for practice:

- Bureaucracy is a dominant and familiar form of organizing people and resources that is appropriate for most problems governments face. However, bureaucracy has limitations.
- Collaboration offers significant advantages to traditional bureaucracy in addressing wicked problems, but those advantages are not easily achieved.
- Beware of the *collaboration halo*, the normative assumption regarding the intrinsic value of collaboration, and the *cult of collaboration*, the blind devotion to pursuing collaborative forms for delivering services and creating public good.
- Collaboration involves social and cultural aspects of organizing, including goal alignment, norms, reciprocity, trust, and commitment.
- Elements in the environment (availability of partners and resources, political will, citizen demand, etc.) affect whether a collaboration can or should be formed.
- Tools in the collaborative toolbox (Table 2) are not fungible or interchangeable. Public managers should select the tool – or combination of tools – from the toolbox that is best suited for the work to be done, the partners they choose, and the situational context where the problem occurs.
- More collaboration is not necessarily better. Public managers should only use the collaborative tools necessary to get the job done.
- When selecting tools, public managers should consider the purpose of the collaborative relationship, the desired results, the anticipated useful life of the collaboration, and the associated transaction costs.

In sum, the strategic choice whether to collaborate requires a consideration of how one might collaborate to produce and deliver public goods and services. Individual and organizational values, contextual and environmental elements, and internal capacity and resource considerations collectively influence the strategic choice to collaborate or go it alone.

## Synonyms

Community development; Coproduction; Public service delivery; Urban planning

## Definition

Collaborative community development refers to the community advancement method whereby citizens or groups of citizens substitute or supplement their local government's efforts to deliver public services and thereby create public and private value. Collaborative community development as a concept is very close to the term of coproduction. Yet, while the concept of coproduction is centered around the process, collaborative community development is a broader notion that focuses on the results of such coproducing activities.

## Introduction

The traditional paradigms of public service provision as the expectations from public administrations have shifted. The local governments are employing greater and more direct citizen participation than ever before to further advance the communities and localities they serve. In municipalities across the globe, traditional forms of governance are being supplemented by collaborative arrangements between governments and their constituencies toward jointly produced public goods and services. This phenomenon also known as coproduction is being utilized – and in some cases, even adopted into law – in efforts to welcome traditionally silenced voices, improve

performance, increase accountability, and survive severe budget cuts. At the core of these efforts is the ever-enduring pursuit of a more effective and representative democracy that reemphasizes the values of democracy through active citizenship and commitment to public interest as the outstanding values of public administration (Denhardt and Denhardt 2011).

The purpose of this entry is to provide a concise overview of the history and importance of this collaborative development phenomenon. Collaborative community development is not a new concept, as it has been recognized in academic and practitioner circles since the 1970s. Its popularity subsided in the 1990s and 2000s, but in recent years, it has reemerged in both practice and theory. Collaborative community development is defined as the process whereby citizens or groups of citizens substitute or supplement their local government's efforts to deliver public services and thereby create public and private value. Classic examples of government's dependence on citizen collaborators can be found in public services such as education, public safety, public health, public facilities, and social services.

Citizen collaboration is critical in meeting public service needs, as public agencies cannot successfully plan, implement, and monitor public services without the cooperation of individual citizens. In addition to their active participation, collaboration with citizens assumes their personal responsibility. If services are to be at all effective, citizens must play their expected roles. For example, a government-run workforce development service may provide training and assist with creating jobs and connecting citizens to these jobs. But it is up to the citizen to convert this government training input into the desired outputs and outcomes, namely, acquiring the skill set being taught and landing and keeping a job by employing this acquired skill set.

Citizens can help manage and improve their public services in a number of ways. Examples include maintaining streets, parks, and other public areas; helping to decide spending priorities and service preferences; using public facilities with care to help extend the life; picking up litter around their neighborhoods; or providing feedback to public agencies to help facilitate continual improvements in service quality.

The theoretical understanding of this process as coproduction is commonly narrated by public participation and urban governance scholars. However, the urban planning literature develops the concept of coproduction further. It adds the surrounding environment and the timeframe of coproducing processes into discussion and refers to this more complete picture as collaborative community development. In this way, the urban planning literature offers the important contextual guidance that helps to better understand the process of collaboration and, most importantly, its results. Therefore, pulling from this body of literature, this entry presents the practical foundations and scholarly evolution of coproduction into collaborative community development from a unique mix of public administration, planning, and community development scholarship.

## Urban Planning and Community Development

Governments often use collaborative community development tools to engage citizens in the planning, delivery, or management of public services. Whereas public services are traditionally viewed as those solely delivered by the government, coproduction theory suggests that the joint production of public services is optimal for both parties. As a result, these citizen-government partnerships can generate greater user satisfaction of public outputs and outcomes, as well as increase the provision of public services. Activation of the collaborative community development mechanisms is especially important in communities where governments do not have the capacity to effectively or sufficiently provide services.

For today's performance-driven, accountability-minded society, the power to elect delegates and access public information is no longer a sufficient means of participation or democracy. Even opportunities to partake in service production and delivery may not suffice if they offer only marginal citizen influence. Rather, engaging citizens

in policy implementation as well as policy formulation and earnestly considering their concerns and ideas may now be the standard (Alford 2009). As such, conventional participatory practices like voting or calling 911 are routinely accompanied by exchanges of ideas and power, for instance, through neighborhood councils or participatory budgeting. Through this more comprehensive approach to participation, citizens not only partner in the production of their public services but they can also interject their preferences and tailor services to meet their specific needs. In so doing, they are jointly engaged in both the planning and delivery of the public services that they subsequently consume and are thus meaningfully engaged throughout the lifecycle of the service (Uzochukwu and Thomas 2018).

## Birth of the Concept in American Inner Cities

What might seem like a norm for most of the developed societies today was not always the case. In fact, it was only in the second half of the last century when collaboration with citizens towards development of their localities was brought up as an issue of necessity. A history of the inner cities in the United States with their characteristically high concentrations of poverty serves as a good example of how the need for collaborative community development was realized and addressed.

The inner cities in the United States have historically been underserved. In their book *Place Matters: Metropolitics for the Twenty-First Century* (2014), urban policy researchers Peter Dreier, John H. Mollekopf, and Todd Swanstrom call the American practice of housing the poor in deteriorating areas of the city center a de facto national housing policy. It has been taking place as early as the 1920s. This institutionalized racism – America's unfortunate legacy and reality – fueled a number of repressive events, such as the white flight movement that contributed to the urban blight we see today in central cities across that country. The white flight movement of the 1950s and 1960s was a mass exodus of White households and businesses from decaying, Black-inhabited central cities to newer, more spacious and more exclusive suburbs. Adding insult to injury, these generally affluent out-migrants received tax subsidies for relocating.

White flight or suburbanization is also commonly associated with the US Supreme Court ruling to desegregate schools. As schools were ordered to integrate, Whites moved to more racially homogenous areas. As well, white flight suburbanization is linked to the Federal Urban Renewal Program that sought to revitalize central business districts, gentrify inner-city neighborhoods, and build highways and bridges that would better connect suburbanites to the central city. However, as with the other initiatives, urban renewal projects – informally referred to as "black removal" – brought much devastation to the urban poor, displacing millions of people nationwide via slum clearance and eminent domain projects that were purposed as economic development (Dreier et al. 2014).

The population decline, business disinvestment, and tax base erosion that followed suburbanization left central cities financially crippled and their immobile remnants isolated and living in abject conditions. Meanwhile, in suburbs, policies enforcing exclusionary zoning, minimum lot sizes, and the separation of land uses (residential, commercial, and industrial) made suburban living expensive, vehicle-dependent, and thus inaccessible to the urban poor (Dreier et al. 2014).

This series of events led to obvious racial and economic polarization across geographic lines. At the time of this socio-spatial transformation, policies requiring *maximum feasible participation* of citizens – particularly poor citizens – in planning and administering local programs were not yet in place. Such participatory mechanisms would later help to ensure that locality development projects undergo more inclusive and transparent public review processes with members of the potentially affected communities (Checkoway 1994; Davidoff 1965).

In the 1960s, American-Canadian journalist and activist Jane Jacobs stepped in and challenged the going approach to urban renewal that

authorized external experts to make life-altering decisions on the behalf of communities whose residents would have little to no influence in the process. These experts were often disconnected physically, emotionally, culturally, or socioeconomically from the communities they were impacting and thus were considered rational, read economically motivated. In her book *The Death and Life of Great American Cities* (1961), Jacobs posits that because neighborhood-centered planning and citizen-engaged processes are better informed and more socially conscious, they are the more appropriate approaches to locality development initiatives like urban renewal.

Soon after, in the middle of the 1960s, planning scholar and practitioner Paul Davidoff introduced the concept of advocacy and equity planning. Ideally, advocacy planning would combat poverty and help rectify racial and other social injustices by empowering all groups in society to advocate for themselves, especially those who had suffered at the hands of urban renewal's unitary planning. Unitary planning has been a practice that allowed only one agency in a community, e.g., a city planning commission or a department, to prepare a comprehensive plan. As such, affected residents were seldom afforded opportunities to participate and thus had little or no influence in the planning process.

At a time when city planning was regarded principally as physical planning like managing land uses and the spatial distribution of facilities, Davidoff proposed a provocative and more comprehensive agenda for planners that would expand planning considerations to include advocating social factors. Explaining that physical structures are merely "servants to those who use them" and assign value to them, he urged his fellow planners to shift their focus from inanimate objects as buildings, highways, and bridges to their value-determining users. To ascertain these values, planners would need to begin incorporating the indigenous knowledge and experiences of potentially affected communities. Citizen participation became widely discussed as a crucial element of a healthy democracy. It was only then when the planning process was sought to encourage democratic urban government, and it was to be done by including rather than excluding citizens from the decision-making process.

Compounding the problems brought on by suburbanization and urban renewal, during the Reagan Administration of the 1980s, federal and state funding to local governments was substantially reduced, causing local programs to suffer major cutbacks. Consequently, public managers began requesting – and in some cases requiring – citizen participation in the production and delivery of public services. To sum up, the emergence of coproduction in municipalities across the United States was largely attributable to: (1) the declining fiscal capacity of the public sector; and (2) the push for more inclusive processes than what existed at that time.

## Scholarly Evolution of the Concept

As participatory governance practices gained popularity, so did academic efforts toward understanding and evaluating its impact. Hence, while there were fewer debates about whether to engage residents in planning and developing public services, discussions about how to do so intensified. For instance, should residents be involved in the planning and design phase, in the production and delivery phase, or throughout the policy process? Should residents be engaged individually or collectively? And how much power should residents actually have in the process? This increasing focus on meaningful participatory mechanisms led scholars to begin associating coproduction with other recent public management concepts such as *collaborative governance*, *participatory democracy*, *community planning*, and *empowered citizenship*.

Furthermore, coproduction literature offers insights into the types of services that can be coproduced. As aforementioned, coproduction became a budget management tool for some struggling cities that came at a time when citizens sought greater inclusion in community affairs. Coproduction has also been a load-shedding strategy for delivering nonessential municipal

services. Some further American examples would be those strategies initiated by President Lyndon B. Johnson under the Great Society social reform program, which goals included elimination of poverty and racial injustice through four main service areas: education, medical care, urban problems, and transportation.

Some scholars noticed that the understanding of the coproduction term tends to be restricted to peripheral or additional services rather than the core public good services. The research confirms this notion that they are the nonessential services that tend to be coproduced. Public services that can afford to be delayed or fully substituted by citizens are most conducive to coproduction. Additionally, services that require low or no skills, and minimal expertise are more likely to be coproduced. In these low-skill activities, coproduction is less likely to be resisted by public personnel, as they may not feel that their job security is being threatened.

Collaborative community development studies are concentrated mostly in the public service areas as Education, Emergency Services, Facilities, Planning, Sanitation, Social Services, Transportation, and General Law and Order. Table 1 provides some references to the studies conducted in these areas. All of these services are typically spearheaded by local governments, and with the exception of Planning and Law and Order, these services can be substituted or supplemented by citizens. Education can be supplemented via tutors or substituted by private schooling. Citizens can supplement emergency services via neighborhood watch programs, fire detectors, and car alarms. Public facilities are typically categorized as nonessential services such as libraries, parks, and cultural venues. Social services include housing and public health programs, such as housing vouchers and health insurance for those who are not able to independently secure such necessities. Public works consist of sanitation services, such as garbage disposal, recycling, water, and sewer, and transportation services such as roads and traffic-related services. The frequency of these public service areas in the collaborative community development literature may be an indication that they are either more easily or more necessarily coproduced than are other service areas. It might also be the case that these service areas are more accessible to researchers.

## Collaborative Community Development and Global South

As collaborative community development has been establishing itself as the concept in the public administration and urban planning fields of

science, the practitioners all over the world started to pay closer attention to the utility of this method in solving local problems and conflicts. The earlier popularity of collaborative community development strategy in the developed countries can be explained by the closer connections between these states and the old established channels of policy and practice benchmarking and learning (Prysmakova 2020). Also, certain levels of countries' development and social capital unarguably set some sound grounds for collaboration to take place.

Meanwhile, those who recently went through the fast development process, like the South Koreans, were fast to recognize that this concept is not foreign to them. In fact, the popularity of collaborative network governance in that region has its deep roots in the local tradition and culture, with government-led initiatives traditionally being the most popular type. At the same time, a public-private partnership structure, where public administrators and the locals participate on equal, has proved to bring much better performance outcomes, and therefore, has been recognized as worthy of closer attention.

Many localities in the countries of the less developed global South have also turned to the collaborative community advancement approach. Here, it offered new and, sometimes, the only opportunities for local population to speak up and to partake in selecting the destiny of their neighborhoods. Collaborative community development strategies created space where diverse perspectives can be shared and discussed. Today, collaboration on the community level can be found almost everywhere. Collaborative rebuilding efforts are essential for the post-disaster rehabilitation of Haiti as they embrace social entrepreneurship, healthcare and environmental stewardship, community agriculture, and planning and construction. Cross-sector partnerships voice the opinion of the locals and allow them to participate and lead the projects while mitigating the conflicts between mining industries and the local population in Chile. Collaborative ventures that further advance the communities are helpful for the social integration of the urbanites from developed countries, known as amenity migrates, and the local rural residents in Costa Rica.

What unites all these seemingly distinct collaborative community development initiatives is that their participants always come from different backgrounds. Thus, regardless of the projects and their locations on the planet Earth, these participants encounter similar challenges and barriers like differences in culture, space, and language that often stand on the way of the effective communication and collaboration. Professionally addressing these obstacles is the key to the collaboration success. Despite of all these challenges, collaborative community development seems to be a strategy worth pursuing. Dialogue and shared power are imperative to create, change, or preserve structures and institutions that are consistent with the interests of local people and allow for the further advancement of their communities.

## Summary

There is an obvious need for collaboration whereby citizens engage in their community development. The potential benefits are noteworthy, most especially in communities where the local government typically does not have the capacity to effectively or sufficiently provide some or all of the services. An important historical example that contributed to the development of the concept is the post-urban renewal era in the United States, when urban blight devastated many central cities, and local governments were financially constrained in their ability to deliver public services. Given the deprived fiscal state of central cities that followed this white flight and suburbanization era, collaborative community development strategies were a natural response from these struggling municipalities. Not only did the cities lack the tax base to provide adequate public services to its residents, but they also experienced greater demand for services because of the increased concentration of poverty.

Collaborative community development tools are essential, when cities need to do more with less, and while citizens are becoming more vocal about their discontent with government practices and performance. The citizens are demanding greater involvement and influence in the

community development decisions that affected their lives. Hence, to help ensure quality of life, promote democratic values, and meet the needs of bureaucracies, the idea of collaborating with the citizens in the attempts of further development of their communities became both appealing and necessary.

Unlike traditional forms of citizen participation, collaboration with the members of the community had promises of expanding citizens' roles from consumers to consumers and co-creators of their public services and the public policies that precede them. Citizens progress from the traditionally indirect and passive involvement in public affairs (e.g., voting, paying taxes) to an innovatively direct and active engagement of citizens in the planning, implementation, and management of public services. For example, when cities experience considerable budget reductions in their police, fire, park, and other public services, citizens voluntarily but necessarily can pick up the slack by volunteering as auxiliary police officers, firefighters, and facility caretakers. This influx of consumer-producers helps to ease the municipality's fiscal strains, while retaining or even increasing the pace of the community development. As an added benefit, citizens can customize public services to better suit their needs.

Coproduction in urban policy-making stems from the general interests of citizens to participate and a more specific and practical interest in how to be meaningfully engaged in city planning and community development. To date, scholars continue to affirm the potential benefits of collaboration with the citizens as a tool for community development and urban planning. Because citizen participation is the cornerstone of democracy, democracy loses its most essential attribute without it. Thus, enabling citizens to participate in the public processes that affect their lives enhances democratic values, such as liberty, equality, and the common good. With resurging interest in more meaningful participatory arrangements in community development such as coproduction all over the world, the further advancement of communities through the tools that attain and enhance democratic values seems very possible and plausible.

## Synonyms

Collaborative Management; Community Collaboration; Participatory Governance; Participatory Management; Public-Private Partnership

## Definition

Collaborative governance is a process where there is an arrangement for the involvement of public agencies, citizens, civil society organizations, interest groups; enterprises, etc. to discuss and decide on the policy issues and implementation strategy. Here, through an interactive decision-making process, various state and non-state actors are involved to arrive at a broad consensus. Collaborative governance encourages a dynamic, contextual, deliberative, diverse view points and flexible way to decide on the policy issues by involving diverse stakeholders in its process. Collaborative governance not only devises policies but also ensures the implementation in a more effective way.

## Introduction

Collaborative governance has emerged as a catchy concept and buzzword in recent times. It is used in the context of both government and nongovernment activities. Many authors have expressed their concern regarding the conceptual clarity, operational usage, and practice of collaborative governance. It is widely used in the decentralized form of governance. It is very eclectic and complex in nature. Some researchers and writers use it interchangeably with collaborative management, community collaboration, and public-private partnership.

However, this entry discusses the importance of collaborative governance (CG) which has been recognized as an important form of participatory democracy where the democratic governance is in practice. It is a form of participatory democracy where citizens or the public is part of the decision-making process. Therefore, it is useful to understand the collaborative governance from the participatory approach. In collaborative governance process, government involves citizens, various civil society organizations, market enterprises along with other necessary stakeholders.

Since last three decades or so, the collaborative and participatory approaches have been popular and adopted in various sectors. In contemporary times, it is almost used in all spheres including urban planning and development, environmental issues, natural resource management, and in the functioning of grassroots level organizations such as Panchayati Raj Institutions in India. In grassroots level democracy, it is proved to be one of the superior methods of governance.

Collaborative governance is becoming more popular in the domain of public administration. There has been a serious recognition to develop leaders and volunteers for collaborative governance. But in the academic domain, till date, there is no robust theory developed yet to understand the frame work of CG. It is a mishmash of various ideas and practices related to the democratic participatory governance.

People often mention that the CG is mostly adoptable in the network society. Some might argue that governance means collective or

collaborative form of action. Then why there is a call for collaborative governance? CG is a kind of governance where the role of citizens becomes more important. In this context, Mark Bevir opines that "collaborative governance refers mainly to cases in which citizens play a more active role in policy—making or service delivery. Typically, collaborative governance is an interactive process in which myriad actors with various interest, perspective, and knowledge are brought together" (Bevir 2012, 109).

## Understanding Collaborative Governance

CG has been defined in various ways but some of the most used definitions have been referred here. It is usually defined as a way to solve the governance problem by involving many institutions and organizations. Agranoff and McGuire (2003) define it as "the process of facilitating and operating in multi-organizational arrangements to solve problems that cannot be solved, or solved easily, by single organizations." Ansell and Gash try to analyze CG both in theory and practice.

Through a meta-analytical study of various existing literatures on collaborative governance, Ansell and Gash (2008) have identified few critical variables that influence the outcome of a successful collaboration in the context of CG. These variables are cooperation among stakeholders, the incentives for stakeholders to participate in the governance process, power and resources imbalances between various agencies and actors, type of leadership, and institutional design. Through meta-analysis, they have identified some factors which are essential and important for a fruitful collaborative governance. These are trust building, face-to-face dialogue, shared understanding and commitment. The authors emphasize on the contingency model and suggest the practitioners of collaborative governance that to the strategy has to be developed in the particular situation. This contingency approach is similar to situation theory or situational approach which is used in management and organization theory. Ansell and Gash define collaborative governance as "a governing arrangement where one or more public agencies directly engage non-state stakeholders in a collective decision-making process that is formal, consensus-oriented, and deliberative and that aims to make or implement public policy or manage public programs or assets" (Ansell and Gash 2008, 544).

There are literatures available on the basis of survey of existing materials on collaborative governance. Most of them point out towards some elements which are very essential for the success of a collaborative governance mechanism. These are: common or shared interests and goals, active stakeholders, participation, meaningful dialogue and effective communication, decision-making, commitment, trust, planning, conducive reciprocal working environment, deliberation, and efficient implementation.

Bevir points out to a difference between CG and network governance, he explains "collaborative governance differs from network governance, therefore, because it involves the citizens affected by a policy or service, not just private or voluntary sector organizations with which the state forms a contract or partnership. Again, collaborative governance differs from whole-of-government approaches because it brings citizens' groups into the policymaking process, not just diverse government departments and agencies" (Bevir 2012, 109).

Batory and Svensson (2019) endeavor to map the literatures on CG and opine that scholarly articles differ in their conceptualization of collaborative governance along at least five dimensions, which concern participation (inside and/or outside government); agency (who drives these processes); inclusiveness (organizational and/or citizen participation); scope (time frame and stage of policy cycle); and normative assumptions (positive or neutral).

Morse and Stephens (2012) designed a procedure of CG and suggest how best it could be taught and used in research steps. They outline a four-phase model of collaborative governance to help the practitioner collaborative governance. They have presented a collaborative governance framework of four phases that can be used in teaching and learning about collaborative

governance. These are assessment, initiation, deliberation, and implementation. Kim (2016) reveals that a new public sphere is created through collaborative community. Here wide ranges of stakeholders interact and various factors such as trust, social capital, social ties, individual empowerment, collaborative synergy come into play. She proposes a community governance model and collaborative governance where three types of capital are involved; these are intellectual, social, and political capital. She finds through her study that collaborative community initiative contributed to generating a social awareness and community-tailored plans and strategies.

## Limitations of Collaborative Governance

CG often has high transaction costs and consumes lot of energy ant at times it is difficult to govern. Conflict of interest may arise during the representation. Often chances are there, powerful may replace or hijack the positions of the weaker sections. Collaborative processes often fail to enforce commitment. Democratic anchorage of collaborative governance practices is often missing (Ansell and Gash 2008).

Participatory development and participatory decision-making processes have been eulogized much. They have also faced criticism. Collaborative governance also seeks participatory decision-making process, which is in much vogue now. It is alleged by the critics that in the name of participation, only some powerful people who have voice, represent the community. Often dominant individual or groups participate in the name of community participation. In this case, disadvantaged categories like women, ethnic minorities, religious minorities, landless workers, and vulnerable poor are left out. Cooke and Kothari argue that participation is new form of tyranny in the process of participatory decision-making process. They articulate in a sarcastic manner that tyranny is the illegitimate exercise of power and participatory development facilitates this tyranny (Cooke and Kothari 2001). John Harris has shown how development has been depoliticized. An institution like World Bank has been using various terms and concepts like social capital in the arena of international development. Harris debunks the agenda of depoliticization by showing how institutions like World Bank systematically obscure class relations and power in the ground level (Harris 2001).

Berner offers a critique to the process of participation; he outlines four main categories, namely, ritualistic, exploitative, exclusive, and substitute participation. Ritualistic participation means little willingness on the part of development agencies and experts to share effective decision-making power, and consultative meetings become mere rituals to legitimize preconceived plans and to manipulate rather than facilitate the process. Exploitative participation is a disguised form of participation. In the name of creating ownership and improving efficiency, development agencies often require beneficiaries to contribute work and money. Exclusive participation deals only with leaders and powerful key informants in the name of community representative participation. Substitute participation looks for manipulation or distortion in the representation (Berner 2010). Collaborative governance can be one of the powerful tools but most of the times it can be hijacked and misused when there is no control mechanism of power.

## Conclusions

Governance literatures emphasize that governance does not include only the affairs of state. Due to the advent of neoliberal policies, welfare state is outsourcing most of the welfare subjects like education, health, transportation, sanitation, etc. to NGOs and CSOs. Then governance demands a new form of rule. Policy makers have advocated a new form of governance, which is different from traditional form of governance.

Panchayati Raj Institutions (PRIs) in India are somewhat modeled in the framework of collaborative governance. Government of India planned according to this model and implemented local level self-governance after the 73rd amendment

of the constitution. In an area, where the majority of people are not conversant with the language of governance, or how to deal with official procedures, it is difficult for them to participate in the process of governance on their own. So, in the name of participation and representation, local elites and petty political intermediaries most of the times take the benefits. Even if in principle collaborative governance sounds good, in practice it still has to deliver with respect to inclusive participation.

Even though there are doubts and criticisms of CG has emerged over the period. There is no doubt that it has the power to generate public participation in the governance process. If we can follow the contingency approach in CG, then we will be able to create a more meaningful contextual approach where two important things could be assured. One is democratic participation of citizens in the policy making and implementation process. The other one is trust building among various stakeholders of the CG. It may also lead to the efficient evaluation of policy and programs which were devised and implemented through the process of CG.

|---|---|
| Grantee | A designated public servant in a local government bureaucracy who coordinates HIV/AIDS health services collaborative governance to enable various services to target populations |
| Collaborative governance | Engagement of cross-sector stakeholders to help make and/or implement decisions relative to addressing a complex public problem |
| Critical variable | A critical variable in this context implies an important factor in collaborative governance toward purposeful ends |

## Introduction

The HIV/AIDS epidemic represents a public health crisis of unimaginable proportion in view of the extensive impact on various sectors of a country's economy including people groups. The magnitude of impact cut across local, state, regional, national, and international domains which necessitated collaborative engagement of relevant stakeholders for care and treatment. The emergent collaborative governance model involving cross-sector stakeholders has thus become an acceptable approach for remedial measures in many parts of the world including developed and developing countries.

As a concept, collaborative governance entails bringing together stakeholders from various sectors: public, civic/nonprofit, and private sectors to collectively make decisions and/or carry out a policy mandate as part of implementation efforts to enable effective and sustainable solutions to a complex public problem (Ansell and Gash 2008, p. 544). The collective resolve among state and non-state stakeholders promotes creative ways to tackle the HIV/AIDS conundrum which is a complex public problem in this case. Scholars use terms such as participatory governance, network governance, collaborative public management, and multipartner governance, among others, synonymously for collaborative governance (Agbodzakey 2017; Ansell and Gash 2008). This paper uses the term collaborative governance in this context to relate cross-sector and multi-stakeholder engagements for care and treatment of HIV/AIDS infected and affected with the Grantee as the critical variable by focusing on the experience of Broward County. A critical variable in this context implies an important factor in collaborative governance toward purposeful ends.

The extent of embracing collaborative governance as a viable implementation strategy manifests in the eventual legislative intent which requires establishment of health services planning councils or designation of existing bureaucratic arrangements to promote care and treatment of HIV/AIDS infected and affected individuals. Such a legislative mandate as part of the Ryan White Comprehensive AIDS Resources Emergency Act (hereafter referred to as CARE Act) exemplifies policy initiatives as a result of a political will to promote health and general well-being of those infected and affected. However, it should be noted that the political will to act was not instant as it took years before the federal government in the case of the United States decided to intervene politically with attendant resource commitment to areas that were disproportionately affected which are termed as Eligible Metropolitan Areas (hereafter referred to as EMA). These EMAs usually have at least 2000 cases of HIV/AIDS (HRSA 2008) and with federal resources including finances are able to make allocation priorities for various service categories for the benefits of target populations using established local collaborative arrangement called the HIV/AIDS Health Services Planning Council (hereafter referred to as the Council) in compliance with federal stipulations. It is in the context of the HIV/AIDS health services collaborative governance at Broward County that the Grantee takes a center stage in care and treatment efforts.

The Grantee in this case is a designated public servant in Broward County local government who facilitates HIV/AIDS health services collaborative governance to enable various services to target populations. Thus, the Grantee engages state and non-state stakeholders representing HIV infected and affected, service providers, and non-elected community leaders at the Council on a regular basis (CARE Act 1990). In fact, the structure of the Council's collaborative arrangement demands Grantee-stakeholder engagements at mostly various standing committee meetings, general Council meetings, and health services-related occasional engagements such as workshops, retreats, and other community events. The Grantee usually reports to Broward County Board of County Commissioners and serves as a liaison between the county, state, and federal governments on HIV/AIDS care and treatment issues. The Grantee

can also be identified as a public service manager who encourages and facilitates cross-sector collaboration in the HIV/AIDS arena for the common good (Scott and Thomas 2017).

## Grantee and Health Services

The CARE Act which mandates establishment of health services planning councils in areas disproportionately impacted by the HIV/AIDS epidemic enables the role of the Grantee at each EMA under the directives of the chief elected official (CARE Act 1990, 2601a). The chief elected official in the case of Broward County is the Board of County Commissioners. These officials use the Grantee in leadership and administrative capacity to engage the Council to help deliver inpatient, outpatient, ambulatory, and comprehensive care and treatment services to HIV/AIDS infected and affected at the county (HRSA 2008). Thus, the Council which is mandated to make allocation priorities, develop comprehensive plans, and assess efficiency of administrative mechanisms for service delivery purposes under the authority of elected officials (CARE Act 1990) provides the avenue for the Grantee to engage various stakeholders for collective problem-solving.

As earlier referenced, the Grantee in the case of Broward County is a designated public servant within the local government administration who facilitates the affairs of the uniquely created Health Services Planning Council on behalf of Board of County Commissioners and the community at large. As the liaison between local, state, and federal governments, the Grantee receives federal grants annually on the county's behalf for care and treatment purposes. In fact, the Grantee strategically engages various stakeholders during the preparation and subsequent submission of the grant application. Furthermore, the Grantee performs additional roles such as coordination of services, procurement and contract monitoring, and some shared roles with the Council such as needs assessment, comprehensive/integrated planning, recommendations for allocation priorities, quality management, and evaluation of outcomes, among others (HRSA 2008, p. 7; Agbodzakey and Taylor 2019).

The Grantee's performance of shared roles with the Council attests to the nature of collaborative governance at the county as a conduit to collectively address the HIV/AIDS conundrum. Performing a role such as needs assessment demands that the Grantee assiduously engages the Council Chair, various committees, support staff, key community organizations, and local government agencies in order to produce a report that duly reflects the extent of care and treatment needs at the county. Similarly, comprehensive/integrated planning necessitates collaborative engagement of key Council members and various committees, county officials and agencies, and additional relevant community stakeholders. The Grantee's performance of the shared roles in addition to specifically solely designated roles as part of county's overall HIV/AIDS health services collaborative governance attests to the unique and critical space that the Grantee occupies when it comes to intentional county efforts to provide various services for care and treatment of target populations. The Grantee thereby serves as a critical variable to promote health and well-being of county residents who are infected and affected and by doing so promotes general population health of the county.

## Modeling Grantee Roles

This section of the paper uses two conceptual models to depict the Grantee's role in health services collaborative governance for care and treatment of target populations. Model I focuses on the Grantee's role in the collaborative process, and Model II highlights the Grantee's general multi-stakeholder engagements as creating community public value with impact. Together, the models promote knowledge and understanding of the Grantee's role as a critical variable in fostering health and general well-being of target populations in Broward County.

## Model I

Model I below depicts the Grantee's integral role in HIV/AIDS collaborative governance in Broward County with a specific focus on the process of engagement. The Grantee engages the various standing committees of the Council in addition to expected engagements at the general Council meetings, retreat, workshops, and community events, among others (Agbodzakey and Taylor 2019). By the established design of the Council, the Grantee participates in the various standing committee meetings and presents reports and essential updates to members to assist in making decision on various agenda items as part of efforts to provide care and treatment to target populations. Furthermore, the Grantee's participation at standing committee meetings also entails assisting the committee chairs during deliberations to clarify issues and resolve process-related disagreements/conflicts even though it is generally understood that the chairs usually moderate the meetings. The Grantee plays similar roles at the general Council meetings. By these roles, the Grantee is able to establish and grow professional working relationship with the various committees and Council members which usually translates into thoughtful allocation priorities to various service categories for care and treatment of target populations.

The model also depicts the interconnectedness of the various standing committees in task and procedural areas. In fact, some tasks are performed by the committees in sequential order with the executive committee providing oversight of the various committees. In general, each committee's task has some implications for the other committees as it relates to substantive and collaborative outputs to promote the health and general well-being of target populations. The Grantee thereby serves as a lynchpin through regular stakeholder engagements, providing vital information and performing other process-related undertakings to foster collaborative governance in addressing the HIV/AIDS problem at the county. Overall, each committee meets, at least, nine (9) times in a grant year and such is the case for the general Council as well with the Grantee playing a vital facilitative role to promote care and treatment (see the model in Fig. 1).

## Model II

The Grantee's critical role in HIV/AIDS health services collaborative governance is equally depicted by Model II below which highlights integrated relationship between the Grantee, Council, and community. As the liaison between the county, state, and federal governments for specific mandated responsibilities, the Grantee fosters collaborative engagement between the Council and community in ways that promote services to target populations while adhering to various government requisites. The Council in this context consists of HIV/AIDS infected and affected, service providers, and non-elected community leaders (CARE Act 1990) concertedly termed as members who are regularly engaged in collaborative forum to make decisions that will enable care and treatment of target populations.

The composition of the Council is in consonance with a legislative mandate associated with implementation of the CARE Act with the Grantee as a facilitative public sector leader steering various efforts to help fulfill established intents and purposes. The Council members are certainly part of the community. However, the use of community here connotes engagements of stakeholders at the Council and beyond. Individuals, people groups, civic associations, non-profit and private entities, policy entrepreneurs, and advocates, among others, are also engaged as part of integrated efforts to ensure various communities are effectively engaged. For instance, case management demands engaging key populations impacted by the epidemic on individual and/or group capacities. Similarly, various service providers who are not directly part of Ryan White services are engaged to enable coordinated services that will promote continuum of care to infected and affected populations. Thus, by steering engagement of multiple cross-sector stakeholders, the Grantee is able

**Collaborative Governance in Broward County with the Grantee as the Critical Variable, Fig. 1** Model on Grantee's Role in the Collaborative Process of the Council. (Model designed by the authors)

**Collaborative Governance in Broward County with the Grantee as the Critical Variable, Fig. 2** Model on the Grantee's multi-stakeholder engagements. (Model designed by the authors and reprinted with permission from IRPA/Taylor and Francis)

to promote shared understanding, commitment, communication, and strategic partnerships for collective problem-solving (Ansell and Gash 2008).

The representation and participation of the various state and non-state stakeholders with the Grantee's facilitative role thereby enable constructive and sustainable outputs for the common good. The engagement of the various stakeholders as part of care and treatment efforts also has the tendency to promote awareness of the epidemic for general population health purposes. See the depiction of the integral relationship as community public value with impact in the model (Fig. 2).

## Reflecting on the Grantee's Impact

The Grantee's role in HIV/AIDS health services collaborative governance in Broward County of South Florida is integral to care and treatment of those infected and affected. The Grantee's intentional and professional engagement of various state and non-state stakeholders at the various committee and general Council meetings enable informed decisions on various services. For instance, the Grantee's recommendations for various service categories enhance the Council's judicious allocation priorities to such services in ways that promote health and general well-being of target populations.

The Council is able to assiduously realize outputs such as needs assessment reports, comprehensive/integrated plans, and outcomes evaluation, among others, because of the Grantee's creative and facilitative leadership as it relates to engaging various stakeholders (Agbodzakey 2017). Thus, the Grantee is able to creatively engage not only stakeholders at the Council and attendant committees, but also effectively engage county government officials, other critical community stakeholders, relevant Health Resources Services Administration (HRSA) officials, and key state officials involved in tackling health and human services challenges. The Grantee's facilitative leadership no doubt fosters the county's compliance with federal stipulations on resource allocation which culminates in regular grant awards and services to those in need. For instance, the Council over the years consistently complies with 75% allocation priorities for core medical services and 25% for support services because of the Grantee's creative multi-stakeholder engagements and recommendations. Furthermore, the allocation of over $165 million for various service categories in 2000–2006 and 2009–2013 time frames to support between 11,000 and 13,000 HIV/AIDS infected and affected in the county on annual basis is to a greater extent because of the Grantee's facilitative leadership (Agbodzakey and Taylor 2019; Broward County HIVPC 2009, 2014a, b). The Grantee thereby serves as an encourager and facilitator of health services collaborative governance in ways that fosters public service management toward purposeful ends and promotes the community's population health and general well-being (Scott and Thomas 2017).

Overall, the Grantee's efforts can be characterized as process effectiveness and community impact as public value. The process effectiveness manifests in regular engagement of the three (3) core groups at the Council and its committees including engagement of other critical state and non-state stakeholders. The community impact as public value aspect is reflected by the intentionally created local capacity at the county level with some external support and the relevant local competencies that are developed as a result to promote care and treatment services for the benefits of various community stakeholders including HIV/AIDS infected and affected.

It should be noted that the Grantee's role in ensuring collaborative success is not without challenges. Challenges associated with the collaborative process, federal resource allocation, and multi-sector leadership and stakeholder engagements are enormous. However, the Grantee is able to navigate through those challenges in ways that promote continuum of care for target populations, and such is likely to be the case going forward.

The Grantee's performance of various roles as enumerated above shows how critical the Grantee is in terms of encouraging, facilitating, and sustaining collaborative governance in a local system context using insights from federal guidelines. The eventual success in meeting the needs of HIV/AIDS infected and affected despite some resource challenges points to how an intentionally created nontraditional facilitative leadership in a usually restrictive bureaucratic arrangement can promote innovation and collective problem-solving. One cannot imagine how the Council in Broward County would have fared without the existing collaborative design mechanism that places the Grantee as the criterial variable in engaging cross-sector stakeholders for sustainable

outputs and outcomes while at the same time creatively engaging centrifugal and centripetal forces for the greater good. Admittedly, the support that the Grantee receives from the Council members, support staff, and other key players in the HIV/AIDS arena makes a difference in ensuring collaborative success for the benefits of target populations.

## Synonyms

Collaboration; Collaborative democracy; Multi-stakeholder governance; Participatory governance; Participatory management

| | |
|---|---|
| **Collaborative governance** | Collaborative governance connotes intentional cross-sector stakeholders' engagement relative to solving complex public problem(s) by making relevant implementation decisions and/or undertaking implementation actions for societal benefits. |
| **Public problems** | Public problems are those problems that are complex affecting various segments of the population, have a domino effect, and are usually tackled through collective cross-sector stakeholders' engagements and actions. |

This research uses the term South Dallas Project (SDP) to depict the collaborative governance initiative by cross-sector stakeholders to help address some of the area's complex public problems, specifically in the identified five zip codes. The term is preferred to South Dallas Employment Project since a careful examination of efforts points to the stakeholders' substantial resolve to address concerns including and beyond employment.

## Introduction

Collaborative governance, whether mandated or not, has become a broadly embraced approach to tackling complex public problems in developed and developing areas of the world. The opportunity for cross-sector stakeholders' engagement promotes the co-creation of solutions for societal benefits. Whether at the local/municipal, state, regional, federal/national, and international/global levels, collaborative governance's common appeal for collective problem-solving is on the ascendancy. Collaborative governance is now visible as part of attempts to address some of the complex public problems in the City of Dallas, Texas, as exemplified by the case of cross-sector stakeholders involvement in the South Dallas Project (SDP) to help mitigate some of the challenges in identified five zip codes of South Dallas.

Dallas is one of the economically viable and progressive cities in the State of Texas and the USA. Per recent population estimates, the city has slightly over 1.3 million people with Hispanics constituting 42%, Whites 29%, and Blacks/African Americans 24%, and is considered the third largest city in Texas and ninth largest in the USA (US Census Bureau 2018; Cubit 2020). While the median household income is about $52,210 for city residents, there are some apparent disparities when race is considered (Data USA 2020). For instance, White households' median income is about $73,000, but it is approximately $31,000 and $38,000, respectively, for Black/African American and Hispanic households (Singh and Asante-Muhammad 2018; Huynh and Kent 2015). The average Black/African American employee makes 54 cents of every dollar while the average Hispanic employee makes 58 cents of every dollar compared to their White counterparts (Young 2018; Groves and Tingle 2018). The economic disparities persist in other areas such as home ownership, property values, housing costs, employment, permit values, and access to credit and wealth gap in general with some leaders legitimately making a case to address economic and opportunity divide of the city and likewise the county (Joseph and Cowan 2017; Singh and Asante-Muhammad 2018). Relatedly, there are disparities in the area of education as well.

Recent statistics indicate Black and Hispanic students are about 2.5 grades and 1.8 grades, respectively, behind White students, and White students are 2.7 times likely to take, at least, one Advanced Placement (AP) course as Black students and 2.4 times as Hispanic students (Bawab 2018). At the college level, the statistics about Dallas are not as revealing as the actual realities indicate. The college graduation rates within the city are about 31% Whites, 30% Hispanics, 25% Blacks or African Americans, and 7% Asians (Data USA 2020), but there are some apparent disparities as Whites are 2.4 times and 5.2 times likely to hold an undergraduate degree compared to Hispanics and Blacks or African Americans, respectively (US Census Bureau 2010; Groves and Tingle 2018; Texas Education Agency 2016). Admittedly, there are other public problems such as crime, incarceration, youth unemployment, and lack of health-care access among others with disproportionate impact on marginalized populations who are mostly Blacks/African Americans and Hispanics.

Like many other cities that are bedeviled with social and economic problems, Dallas is awakening to the harsh realities of endemic disparities and the likely dangerous consequences to the overall health and general well-being of the city and its residents. While push and pull factors, including history, policies, and race relations, are partly responsible for the current predicaments, there is agrowing awareness for cross-sector solutions to address the challenges constructively. One of such emergent cross-sector solution-oriented efforts based on collaborative governance is the South Dallas Project which can be categorized as a collaborative governance experiment (about a year old) involving community stakeholders consisting of well-meaning individuals and entities.

The SDP, which consists of stakeholders representing public, private, and nonprofit/civic spheres, is geared toward addressing endemic problems of unemployment, lack of living wage, reintegration of returning citizens from correctional facilities, lack of affordable housing,

transportation, digital divide, etc. (South Dallas Project 2020). The initiative includes primary partners and other valuable collaborative partners working collectively to address the various challenges facing some segments of the population/community. This paper intends to highlight the use of collaborative governance by SDP as a framework to help address the complex and endemic public problems in the City of Dallas and explain the rudiments of SDP efforts in general, and draw some implications for policy and administration. The paper's segments will consist of excerpts on the collaborative governance framework, SDP and collaborative governance model, conclusions, and implications.

## Collaborative Governance Framework

Due to the multifaceted nature of various public problems relative to service delivery to citizens, the growing governance burden is necessitating alternative approaches to addressing public concerns. The urge for such alternative approaches to the multifaceted problems is based on the palpable awareness that government alone cannot effectively address the growing needs of citizens. Collaborative governance, which promotes cross-sector stakeholders' engagement as to address complex public problems, has become a commonly used framework to foster creative solutions for societal benefits. Scholars such as Gray (1989), Agranoff and McGuire (2003), Bryson et al. (2006), Jung et al. (2009), Agbodzakey (2012), Daniel et al. (2013), Freeman (1997), and others present cases of a collaborative governance approach in addressing complex socioeconomic, health, environmental, and law enforcement situations.

As a concept, collaborative governance relates engagement of stakeholders from cross-sectors to either make decisions and/or implement decisions as a conduit to help enable outputs and outcomes for societal benefits (Ansell and Gash 2008; Bryson et al. 2015). The drive for collective cross-sector action is usually a consequence of complex public problems with a domino effect on various country segments, including different population groups. While the cross-sector's stakeholders may have divergent interests and perspectives on the public problem of focus, the determination to find the solution(s) to the identified common problem (s) helps to forge consensus on the way forward and commitment to foster implementation action for the greater good (Ansell and Gash 2008; Agbodzakey 2010).

The diverse representation and participation of stakeholders from public, private, and nonprofit sectors in collaborative governance creates needed synergy for collective action. Each sector's stakeholders can draw on their unique strengths to complement established mandated or voluntary tasks as a conduit to success. For instance, nonprofit/civic organizations' representation and participation in allocation priorities for core social and support service categories could enrich deliberations and eventual allocation decisions. Their contributions are likely to be informed by service delivery experiences to diverge populations/target groups in various communities.

Multiple variables drive collaborative governance in ensuring outputs and/or outcomes that reflect constructive and sustainable solutions to community and societal concerns or problems. The convergence of such variables in line with the established intent of collaborative governance symbolizes cross-sector stakeholders' collective will to improve the identified societal situation. Scholars such as Bryson et al. (2006), Thomson and Perry (2006), Ansell and Gash (2008), Agranoff (2012), Proven and Kenis (2008), Emerson et al. (2012), and Koschmann et al. (2012), among others, have identified initial/antecedent and process variables as key to collaborative governance outputs and/or outcomes.

The initial/antecedent conditions represent such elements that foster the willingness of the cross-sector stakeholders to engage. Whether it is a mandate, resource commitment, agreement on rules of engagement, recognition of divergent interests, history of collaboration, etc., these drivers help lay the necessary foundation for collaborative governance (Bryson et al. 2006; Provan and Kenis 2008). For instance, agreement among the divergent stakeholders relative to engagement

at general and committee meetings helps set the stage for the number of meetings and the nature of deliberations as connected to the process.

The collaborative governance process variables reflect stakeholders' engagement concerning established tasks and attendant expected outputs/outcomes. The frequent dialogue among the stakeholders helps to make decisions and/or map out implementation strategies to promote constructive efforts for the common good. Process variables such as communication, consensus, commitment, shared understanding, mutuality, and trust building (Ansell and Gash 2008; Thomson and Perry 2006) are relevant to generating needed outputs/outcomes.

The initial/antecedent drivers for collaborative governance are usually complemented by what some scholars have termed critical variables to collaborative governance. The contention is that the initial drivers and process variables are not enough to sustain collaborative governance's grueling nature. Thus, leadership that is facilitative and structural configuration that creates an environment for representation and participation of cross-sector stakeholders are pivotal to ensuring collaborative success (Bryson et al. 2006; Ansell and Gash 2008). In effect, the nature of the collaborative process among stakeholders aided by the critical variables can promote outputs and/or outcomes for societal benefits.

The outputs and/or outcomes of collaborative governance are usually a product of the intentional efforts of stakeholders. The stakeholders' commitment to collaborative governance based on common resolve for workable solutions to a complex public problem drives their engagement in all collaborative process stages with the eventual creative outputs and/or outcomes. While the collaborative governance outputs can be somewhat tangible and quantitative, the outcomes are usually qualitative and sometimes difficult to measure. Collaborative governance outputs/outcomes, whether positive or otherwise, represent a consequence of multistakeholder engagement regardless of the meager or gargantuan nature of such an output and/or outcome. In successful cases, the outputs/outcomes are likely to be sustained because of the multistakeholders' involvement.

As is usually reflected by the outputs/outcomes, the success or failure of collaborative governance somewhat embodies benefits and challenges. Representation and participation of cross-sector stakeholders relative to a complex public problem could create some benefits such as innovation, resource pool, mutual accountability, and sustainable outcomes, among others (Choi and Robertson 2014; Sirianni 2009; Agbodzakey 2017). Relatedly, challenges, which could be conflicts among divergent stakeholders, slow decision-making, power struggles, time constraints, etc., can directly or indirectly impact collaborative governance (Memon and Kirk 2010; Emerson et al. 2012; Daniel et al. 2013). Nonetheless, collaborative governance embodies the dichotomy between challenges and benefits and typifies creative tensions associated with relevant collective intents. The South Dallas Project exemplifies multistakeholder engagement to help address endemic challenges in the City of Dallas and to some extent Dallas County, and highlights the intersectionality of interests and attendant creative solutions for societal well-being.

## South Dallas Project

The South Dallas Project (hereafter referred to as SDP) is a voluntary and nonmandated initiative consisting of cross-sector stakeholders from the public, private, and nonprofit/civic sectors. These stakeholders represent divergent interests but are united by a common resolve to address complex societal concerns. Whether in direct service provision, consulting, support services, or training, stakeholders' efforts mark a unique contribution to help realize the intents and purposes of the SDP.

The SDP's primary intent is to utilize the strategic approach of collaborative governance to promote the interests of opportunity populations in South Dallas, specifically in the five identified zip codes as a conduit to sustainable individual and community well-being. Opportunity populations in the context refer to (1) individuals returning from incarceration (and in need of support to reintegrate into society), addiction treatment, or under the jurisdiction of County's

Specialty Courts; (2) high school students in grades 8–12 in Career and Technical Education (CTE) programs; and (3) young adults in the 18- through 24-year bracket (South Dallas Project 2020, p. 3). The referenced opportunity populations in the identified five zip codes (75210, 75215, 75216, 75217, and 75228) have endemic challenges of incarceration, recidivism, unemployment, and the challenge of earning a living wage when eventually employed, among others (South Dallas Project 2020).

The SDP's focus on the defined opportunity populations is driven by existing disturbing evidence. Some of the targeted zip codes have the highest incarceration rates in the State of Texas. For instance, South Oak Cliff, with zip code 75216, has an incarceration rate of 2.2% of the area's population, representing 816 individuals. Pleasant Grove with zip code 75217 has an incarceration rate of 1.22% of the area's population, which means 682 individuals, while the rates are as high as 2.8% and 2.6%, respectively, in zip codes 75215 and 75210 (Shinneman 2019). The high incarceration rate of individuals is equally compounded by the recidivism, which is as high as 68% (Fabelo et al. 2016). Relatedly, youth unemployment is equally high.

While Dallas County currently has an 8.4% unemployment rate (YCHARTS 2020), the rate is much higher when ethnic disparities are considered. The unemployment rate is as high as 22% among Blacks and Hispanics in the 16- through 24-year bracket (US Bureau of Labor Statistics 2020). The high rate of unemployment among youth creates a sense of hopelessness and places affected youth in a severely disadvantaged position regarding economic mobility and well-being in general.

The identified area of focus, which consists of the five zip codes, is predominantly inhabited by African Americans and Hispanics. The current demographics consist of the following: Blacks/African Americans 59%, Hispanics 40%, and other races 2%; education rates, ages 25–64, are 36.8% without high school diploma; 32.5% high school graduates; 19.4% some college without degree; 4.4% a two-year degree; 4.4% a four-year degree; and 2.5% a postgraduate degree; and per capita income ranges from $11,921 to $20,812 (South Dallas Project 2020, p. 2). Thus, the underserved and underrepresented nature of this area called for creative ways to promote viability and sustainability. The SDP serves as one of the catalytic initiatives for community revitalization and sustainability.

The SDP is not a mandated initiative but rather a coalition of caring and well-meaning cross-sector stakeholders represented by organizations from public, private, and nonprofit/civic spheres to address unemployment and attendant issues such as certification needs, a living wage, and transportation, among others. The commitment and common resolve among the stakeholders to the primary established intent is essential for collaborative success. Thus, as a collaborative and voluntary initiative, SDP does not have a centralized authority structure, but is coordinated by two nonprofit entities, namely Redemption Bridge and the State Fair of Texas.

The facilitative role of Redemption Bridge and State Fair of Texas foster outreach, representation, and participation of relevant community-centric organizations. The diverse nature of representation and participation creates a synergy for collective action. For instance, as an emergent initiative, the various stakeholders collectively work on the protocols of engagement relative to the governance of their collaborative efforts, especially the collaborative process and its likely impact on outputs and outcomes. Ansell and Gash (2008) and Johnston et al. (2011) emphasize how initial agreement among stakeholders in collaborative governance is critical to constructive engagement and collaborative success.

The collaborative governance process usually fosters regular dialogue among the stakeholders with attendant consensus on the various deliberation subjects as a conduit to realizing anticipated outputs and/or outcomes. The process of engagement related to the SDP involves monthly general meetings and monthly specific standing committee meetings. The general meetings, usually referenced as an advisory council, allow for all the stakeholders to converge and collectively discuss the various undertakings to foster progress, shared understanding, and communication. The

standing committee meetings are usually tailored toward deliberating on specific initiatives per each focused area and are limited to stakeholders involved in targeted undertakings. The executive committee meetings serve as a strategic engagement toward providing needed direction, facilitation, assessment, and performance enhancement for the project. The steering committee meetings concentrate on the implementation and integration of all connected actions for collaborative success. Collectively, all of the various dialogues and attendant tasks as part of the collaborative governance are critical to addressing the concerns of the identified opportunity populations in South Dallas.

In an attempt to help tackle the SDP's primary established intent collectively, collaborative governance is organized around seven standing committees. The committees consist of living wage employment; housing; transportation; health, wellness, and recovery; community connectivity; digital access; and public policy, and are critical to meeting the target populations' needs and expectations (South Dallas Project 2020, p.2). The Living Wage Employment Committee focuses on promoting training and employment opportunities for target populations by working with relevant industry partners that will translate into living wage jobs; the Housing Committee fosters access to housing to help address lack of sustainable housing concerns of the target populations; the Transportation Committee works on enabling targeted access to employment-related transportation; the Health, Wellness, and Recovery Committee helps in addressing general health and well-being concerns; the Community Connectivity Committee promotes collaboration among the various nonprofit and civic entities working on specific targeted areas for enhanced performance; the Digital Access Committee aims at addressing the digital accessibility gap in targeted areas as a conduit to individual and community viability; and the Public Policy Committee concentrates on strategic legislative measures by working with relevant offices in the public policy and administration space for pragmatic solutions to target populations' challenges (South Dallas Project 2020, pp. 1–2). Admittedly, the various committees' contributions to the project collectively represent one of the hallmarks of community revitalization and transformation of South Dallas through a nonmandated initiative.

The enormous level of involvement by the cross-sector stakeholders makes the project a promising one for South Dallas. Currently, there are a total of 74 entities/organizations involved, comprising 11 primary partners such as Dallas College, the University of North Texas at Dallas, the City of Dallas, Dallas Independent School District, and the Council of Governments; 42 nonprofit service providers to the target populations; 6 auxiliary nonprofit service providers; and 15 government entities across local and state levels including county, state, and federal prisons, and the specialty courts, among others (South Dallas Project 2020, p. 3). These stakeholders' direct and indirect contributions are critical to attaining the project's primary established intent and, consequently, in advancing the viability and sustainability of South Dallas. The next segment of the paper focuses on the project's collaborative governance model with likely outputs and/or outcomes for societal benefits.

## The SDP Collaborative Governance Model

The SDP collaborative governance model/figure 1 below explicates the rudiments of collective efforts toward addressing concerns of identified opportunity populations in South Dallas. The model/figure 1 highlights initial agreement/conditions of engagement by the stakeholders as the foundation for collaborative governance, diverse cross-sector stakeholders' representation and participation, collaborative governance process involving stakeholders in the various specific standing committees with shared understanding, and commitment to the process, communication, and consensus as key process variables enabling the engagements (Ansell and Gash 2008). The representation of collaborative governance process in the model/figure 1 as both conceptual and practical is reflective of the convergence of the two related streams relative to the SDP's experience and as typical of the use of the collaborative

**Collaborative Governance Without Hierarchy: The Case of South Dallas Project, Fig. 1**

governance framework. Furthermore, facilitative leadership provided by Redemption Bridge and State Fair of Texas coupled with protocols of engagement (institutional design), knowledge, and understanding of the rudiments of the South Dallas system context by the involved stakeholders and the common resolve to promote the community's interest are critical drivers of the collaborative process (Emerson et al. 2012; Agbodzakey 2017). Consequently, these critical drivers alongside other collaborative governance elements enable outputs and/or outcomes for societal benefits.

The initial outputs and/or outcomes of the project so far are reflected by the commitment of, at least, 418 employers to regularly engage the identified opportunity populations for employment purposes, growing certification and employment of the target populations, gradual closing of the digital access gap, growing direct stakeholders/organizational efforts of 74 participating entities (including the primary partners), increasing flexible pathways/access to sustainable housing and transportation, and increasing success for the reintegration of ex-offenders into the community/society among others with the eventual culminating effects of job security, individual/family empowerment, community revitalization, and sustainability. For instance, the Federal Reserve Bank of Dallas, AT & T, and T-Mobile are now very involved in promoting digital access and inclusion, especially in marginalized communities within the City of Dallas (South Dallas Project 2020). The model/figure 1 showcases the iterative and inextricable connectedness of all the constituent parts to enable collaborative success within the context of the project's primary intent for societal benefits. While a legitimate argument can be made for the inconclusive nature of the initial outputs and/or outcomes because of the project's one-year experiment, the indicators so far are leaning in the positive direction and thereby worth accentuating. A better assessment of collaborative governance success in the near

and/or distant future relative to the SDP will be contingent on a well-documented quantitative and quality measures as culminating results and reflective of the community's transformation/revitalization.

## Conclusions and Implications

The growing demand for public services and the complexity of citizens' needs in either democratic or nondemocratic regimes coupled with governments' inability to effectively address concerns of the various segments of the population warrant alternative approaches to meeting the needs and expectations of the governed. The complexity of the public service needs is substantial not only at the state or federal level but also at the local level and exemplified by the situation in South Dallas. Problems of lack of living wage to some employed segments of the population, incarceration, and attendant reintegration challenges, such as disparity in income, housing, digital access, education, healthcare access, access to loans, and property ownership (Groves and Tingle 2018; Joseph and Cowan 2017; Singh and Asante-Muhammad 2018), do not only worsen the plight of the marginalized populations, but eventually will impact the general health and well-being of the city both in the short and long term.

The emergent realization for the use of collaborative governance as a viable approach to address some of the complex public problems offers hope for societal viability and sustainability. For example, the efforts of the South Dallas Project in tackling unemployment, reintegration challenges of returning citizens, housing, digital access, transportation, health and wellness, etc. (South Dallas Project 2020) provide a pathway to empowering individuals and families in South Dallas with likely corresponding positive effects on the community at large. While the project is at the initial/experimental stage, the wherewithal of committed partners so far, coupled with shared understanding and commitment to the process (Ansell and Gash 2008) based on collaborative governance concerning the primary established intent, is promising.

The sustainability of the SDP initiative will be contingent on the continuous adherence to the primary established intent of the multistakeholders' engagement for collective problem solving within the local system context coupled with the effective role of critical collaborative governance variables such as facilitative leadership and institutional design (Emerson et al. 2012; Ansell and Gash 2008). The collective appreciation of divergent stakeholders' interests and contributions, and the continuous convergence of such interests in a tailored manner for the common good of the identified opportunity populations and South Dallas in particular, are paramount. Putting measures in place to deal with turf battles, process-oriented conflicts, succession challenges, trust and consensus building, mutuality, relevant communication, evaluation and reimplementation, ownership of decisions and actions whether positive or negative, the celebration of small wins, and the resolve to reinvent would be integral (Agbodzakey 2017; Johnston et al. 2011; Crosby and Bryson 2005; Thomson and Perry 2006).

The call to work collaboratively across sectors for the greater good is now more compelling than ever. Governments at various levels are persevering in service delivery, and nonprofit/civic and private entities are complementary. Sometimes, direct interventions in the social policy space and joining forces with established intent to target identified complex public problems enable constructive societal benefits. While there is no guarantee of success, the stakeholders' resolve to collaborate provides a better alternative to the top-down adversarial management (Freeman 1997). The use of collaborative governance, which enables either public or nonprofit/civic and private sector entities/stakeholders to initiate and coordinate multisector engagement for collective complex problem-solving without a need for hierarchy or centralized management, is likely to remain a more embraced approach in the near and distant future.

# Collaborative Networks as Public Administration Instruments

Stephanie Bultema
University of Colorado Denver School of Public Affairs, Denver, CO, USA

## Collaborative Networks Definition

Collaborative networks take many different forms, but always involve three or more organizations working together to achieve some common purpose that none of them could accomplish alone. They can be formal or informal, involve one or many sectors, and have a fairly even distribution of power throughout the network. Collaborative networks are unique because they emphasize organic evolution and shared power among members.

## Introduction

In today's networked environment, public administrators are often expected to work across boundaries to advance organizational goals. Oftentimes the nature of the policy problem being addressed is so broad that public administrators have no choice but to collaborate with cross-sector organizations. This is particularly common in the health, education, and environmental policy domains where solutions to public problems require extensive collective action across sectors and interest groups. One way public administrators can advance organizational goals is by participating in – or perhaps even leading – collaborative networks. This chapter explores the demands placed on public administrators to work within interorganizational networks and how they can use these networks as public administration instruments.

The chapter starts with an overview of the three primary types of interorganizational networks: policy networks, governance networks, and collaborative networks. It then reviews some of the most notable benefits to using collaborative networks as public administration instruments. Next, key considerations for how to effectively build, manage, and evaluate collaborative networks are presented. The chapter concludes with a case study that demonstrates how one form of collaborative network – Accountable Communities of Health (ACHs) – use collaborative networks to address urban issues such as health equity and the COVID-19 pandemic of 2020.

## Types of Interorganizational Networks

Networks are everywhere; wherever three or more things are connected to one another in some way, that is a network. They are frequently complex, ever-changing, and difficult to depict. Networks can consist of people, organizations, policies, and beyond. People who are friends; roads, highways, sidewalks, and train tracks that intersect; web pages that point to each other; electronic devices linked by communication systems; proteins that interact; streams, rivers, and larger bodies of water flowing into one another; and organizations that undertake collaborative projects – these are all examples of networks.

The history of interorganizational networks is as long as that of organizations themselves; after

all, organizations rely on transactions – frequently with other organizations – to carry out their missions (Pfeffer and Salancik 2003). These transactions form networks of organizations, with each node representing an organization and each linkage representing a transaction. The employment of interorganizational networks has not only grown in prevalence over time but has recently been socialized as the "network way of working." Public affairs scholarship often assumes that public administrators will necessarily work with and through networks to accomplish their goals. They may collaborate across organizations, work within policy networks, form alliances, or partake in advocacy coalitions. Past research has typologized these different forms of networks and various others, including an assessment of their unique and overlapping tendencies. Frequently studied types of interorganizational networks, grouped according to the primary categories of research on networks as identified by Isett et al. (2011), are described in the following sections.

### Policy Networks

Policy networks bring all sorts of actors – political groups, for-profit companies, nonprofit organizations, public agencies – together around a public policy idea in which they are all invested for one reason or another (Klijn and Koppenjan 2000). These actors exist within the macropolitical system, which is generally thought to be a stable set of conditions surrounding the network (Jenkins-Smith et al. 2018). The macropolitical system determines the resources, laws, and norms of a community. An explicit focus on influencing the policy process and manipulating the macropolitical system are key characteristics of policy networks, which form when multiple actors join forces to influence a policy outcome. Iron triangles emerge within the macropolitical system, and are comprised of policy-making relationships among congressional committees, bureaucracy, and interest groups. These iron triangles are also called policy networks, which interact with issue networks. Issue networks are formed when people band together around ideas to create networks that can influence policy, even if they are not part of a traditional policy network; they are sometimes referred to as pressure groups, lobbies, and unions. Policy subsystems form around issue networks within a policy network. Leaders may emerge within a policy subsystem and form an advocacy coalition focused on collectively addressing its issue of focus. Policy networks, issue networks, policy subsystems, and advocacy coalitions are just a few types of interorganizational networks involved in policy processes.

### Governance Networks

Governance can be defined in various ways, from the broad conception of people, institutions, and processes that guide activities of a group to a narrow conception of one actor overseeing the actions of another actor (Meier and O'Toole Jr. 2006). Governance networks bring organizations together to achieve a common goal, frequently employing public goods, services, and policymaking in the process. The main feature setting governance networks apart from other types of networks is their centralized power structure. Collaborative governance is a form of governance network that is characterized by people and organizations working across boundaries to jointly develop and implement solutions to complex public problems. Related to collaborative governance is collaborative public management, which tends to be focused within a single organization or community, rather than across broad policy domains. Network governance is similar to collaborative governance and collaborative public management but places less emphasis on collaboration and is commonly seen in private industries. This type of network typically involves select organizations that work together to produce a service or product, with relationships such as social contracts or agreements connecting actors. Government contracting (when government provides public services through independent contractors) is similar to network governance because of the contractual relationships, but different in that they are typically governed by a single public agency. Less structured still is polycentric governance, where there are multiple centers of power and decision making is largely

autonomous, though still interrelated. Collaborative governance, network governance, public contracting, and polycentric governance are common forms of governance networks where power is centralized among one or a few interrelated actors.

### Collaborative Networks

Collaborative networks also take many different forms, but always involve more than two organizations working together to achieve some common purpose that none of them could accomplish alone (Agranoff 2006). This could be creating a product, delivering a service, or any other joint endeavor. They can be formal or informal, involve one or many sectors, and have a fairly even distribution of power throughout the network. These networks are collaborative, which means their work cannot be forced, requires ample time and continuous attention, and is motivated by a well-defined goal. Collaborative networks are unique because they emphasize organic evolution and shared power among members. Collective action situations are one type of collaborative network that has been extensively studied in the public affairs literature. The idea of collaborative networks was popularized in the public affairs literature by Mancur Olson's (1965) exploration of how groups interact with public goods and then elaborated upon by Elinor Ostrom (1990) as a way to manage common pool resources. Research on collective action has revealed that cooperative endeavors are more likely to succeed if all actors can communicate, know one another, know that their participation will make a difference, are able to freely enter or exit the group, are committed in the long-term, and have an agreed-upon process for authorizing and/or penalizing one another. Other, more specific types of collaborative networks exist within the realm of collective action. Cross-sector partnerships, strategic alliances, and cross-sector collaboration specify that the collaborative network must involve more than one sector. Coalitions, while often formed among individuals in a single organization, can also form between multiple organizations. A collaborative network can be defined as a coalition if it includes multiple interacting actors, has been intentionally formed, has no formal structure, is focused on a specific issue and goal(s), and needs members to coordinate action to achieve those goals. Collective action situations, cross-sector partnerships, strategic alliances, and coalitions are just a few types of inter-organizational networks that can form with a collaborative purpose.

As evidenced by the numerous types of interorganizational networks, they can be incredibly useful instruments for public administrators (Isett et al. 2011). While each broad type of interorganizational network – policy, governance, and collaborative – serves a distinct (but not necessarily separate) purpose in public affairs, employing collaborative networks offers potential advantages for public administrators. First, collaborative networks often include elements of policy and governance networks. For example, they are frequently formed around a broad policy issue such as health care. They usually incorporate some level of governance, such as a designated backbone organization or a formal board of directors. This means collaborative networks can enjoy the benefits associated with policy networks (e.g., policy change) and governance networks (e.g., collective action) while also enjoying the benefits of collaborative networks (e.g., innovation). Ultimately, public administrators working through collaborative networks should understand elements of each distinct type of network and employ those elements when appropriate. However, public administrators will likely find the most value when working through collaborative networks since they offer many potential benefits such as bringing together diverse stakeholders, developing and implementing solutions to complex problems that may not have been possible by a single agency, and developing solutions that span multiple institutions and policy domains (Bardach 1998; Willis et al. 2015). Rather than advancing a single policy issue or governing a single product or service, collaborative networks offer the flexibility to be creative, the inclusiveness to integrate a variety of actors, and the power of multiple organizations joined forces to achieve a shared goal.

## Benefits of Collaborative Networks to Public Administrators

Public administrators stand to gain by working through collaborative networks. Two of the most notable potential benefits include process improvements and better outcomes. When actors come together with a collective purpose and intentionally share power across the network, public goals can be achieved at a greater scale than would otherwise be possible (Emerson and Nabatchi 2015a; Emerson et al. 2012).

Collaborative networks can improve processes, or how things are done in an organization or community (Ulibarri 2015). Since collaborative networks frequently encourage broad participation across sectors or represented groups, they often lead to enhanced diversity of participation and decision-making. The collaborative forum offers the opportunity for diverse actors to have meaningful discussions that ideally result in creation of and alignment around a shared vision. This collaborative approach often results in greater buy-in and motivation among participants. For these reasons and more, the ways in which public administrators get things done – or their processes – can be improved by working through collaborative networks (Heikkila and Gerlak 2016; Thomson and Perry 2006).

The outcomes – or end results – that public administrators are trying to influence can also benefit from working through collaborative networks (Scott 2015; Willis et al. 2015). For example, individual organizational missions can be advanced by working through collaborative networks since organizations can achieve greater change by working together than by working alone. An effective collaborative network can catalyze collective action on a policy issue or public problem, thereby creating change on cross-cutting public issues. Furthermore, since collaborative networks are frequently diverse and share power across people and groups, they can meld disparate ideas to create new, innovative solutions. Overall, public administrators may be able to achieve much greater results by working through collaborative networks than they would otherwise be capable of realizing through an organization-centric approach (Amsler and O'Leary 2017).

Although collaborative networks present many potential benefits for public administrators, they are not without challenges (Scott 2016). At a basic level, participation in collaborative networks requires an investment of resources, with investment of people's time being a minimum resource requirement. Public administrators are faced with many competing demands and must manage their own time and their staff's time responsibly. Committing to participate in a collaborative network can be a time-intensive endeavor, which may or may not be possible for public administrators and employees who are often stretched thin. Before committing to lead or participate in a collaborative network, public administrators should carefully weigh the resources required for participation against the potential benefits to be gained from involvement.

Developing an effective collaborative network that shares power among participants, is effectively governed, and is productive in making progress toward its goals can be an incredibly difficult endeavor (Ansell and Gash 2008; Emerson et al. 2012). A common challenge faced by collaborative networks is the ability to develop the capacity for joint action (Emerson and Nabatchi 2015a). Participants may agree on a shared vision and feel motivated to work toward common goals but lack the structures or capacity to move a collaborative network where they want it to go. Although it is still possible for public administrators to reap benefits from participating in ineffective networks (e.g., development of new relationships or increased connectivity within a community), an ineffective network is unlikely to realize its intended population-level outcomes. These types of considerations and others should be accounted for when deciding whether to use collaborative networks as a public administration instrument for a given purpose.

## Using Collaborative Networks as Public Administration Instruments

Large bodies of literature describe what is currently known about how public administrators

can effectively work through interorganizational networks to advance organizational missions (Milward and Provan 2006; O'Leary 2015; O'Leary and Bingham 2009). Advice for creating and maintaining effective collaborative networks is often grouped into three categories: building, managing, and evaluating networks. A summary of what is known about effective practices for each of these three categories is provided below.

Building effective collaborative networks takes time, dedication, and commitment (Emerson and Nabatchi 2015a). At the start, various drivers such as leadership shape how the network develops. Once the network has been initiated, participants must actively engage to develop a shared vision. Trust is crucial for a collaborative network's development; it is a good idea to invest the time up-front to ensure everyone knows one another. It is also important for network leaders to help ensure people know and understand one another's interests. One way to build trust and mutual understanding is by ensuring all actors can freely and regularly communicate with one another. This can be done in a variety of ways, whether it be through regular meetings, web-based communication channels, or facilitated discussions. Through this process of trust-building and developing shared understanding, collaborative networks can gain the foundation needed to work toward achieving common goals (Ansell and Gash 2008; Silvia 2011).

Managing effective collaborative networks requires strong leadership, guiding structures, and participant buy-in (Emerson and Nabatchi 2015a). It is crucial to develop shared motivation within the network, which requires a basic level of mutual respect among participants and a general perception of legitimacy of the network and its purpose. Participants must understand that their participation in the collaborative network will make a difference and how they can contribute. They must also be committed in the long-term. These management issues can be addressed through trust-building, power-sharing, role clarity, collaborative development of a theory of change, and transparency of rules and processes. As mentioned previously, developing the capacity for joint action can be especially challenging, but is a necessary step for a collaborative network's eventual success. Pooling resources and harnessing the collective power of diverse actors is what yields the benefits of working through collaborative networks for public administrators. When they fail to achieve the capacity for joint action, collaborative networks are unable to achieve their goals and frequently disband as a result. Ultimately, managing an effective collaborative network requires adaptive leadership that merges a visionary approach, the ability to convene actors across boundaries, and action-oriented strategies that draw on the collective resources of the group (Ansell and Gash 2008; Provan and Kenis 2008).

As collaborative networks create change in the surrounding system, they must evaluate the change and the resulting impact of the change (Emerson and Gerlak 2014; Emerson and Nabatchi 2015a). There are many reasons to evaluate the work of collaborative networks: to demonstrate progress and achievements; to ensure the intervention is having the desired effect and has not caused unintended consequences; and to learn which parts of the intervention were most or least effective. Two tools may be of particular use when evaluating a collaborative network. First, understanding the network's theory of change (e.g., logic model) can provide critical guidance on how inputs and outputs are expected to interact to produce outcomes (Emerson and Nabatchi 2015b). This can not only guide program activities but inform measures and outcomes of interest in an evaluation. Second, specific methods such as network analysis may be well-suited in the evaluation of collaborative networks (Kapucu and Demiroz 2011). Network analysis is any structured technique to quantitatively analyze a network; it can produce descriptive, inferential, and predictive statistics that provide insight into the collaborative network. For example, network analysis can assist with describing the overall connectivity in a network; inferring which characteristics are most closely associated with positive network outcomes; or predicting how a change in network composition would affect

network outcomes. Furthermore, the network maps (visualizations) produced through network analysis can help people better understand how the network functions and they can act as a powerful tool for discussion. Collaborative networks that incorporate formative and summative evaluation into their work will better understand what is working and how the network can improve (Emerson and Nabatchi 2015a).

## Statewide Health-Focused Collaborative Networks: Accountable Communities of Health (ACHs)

The Accountable Communities of Health (ACH) model was proposed in response to major policy change in the United States with the passage of the Patient Protection and Affordable Care Act (ACA) in 2010. The ACA requires states to demonstrate improvements in the quality, value, and implementation of their health systems, which led several states to implement the ACH model (Heider et al. 2016). To date, the ACH model has been adopted by numerous states, with each state taking a slightly different approach to how the collaborative network is implemented (Funders Forum on Accountable Health 2020). Although each ACH is unique, they all follow the same basic model: bringing people and organizations together across sectors to improve health and well-being for communities.

ACHs operate as interorganizational networks that collaboratively govern local and state-wide community health system transformation by implementing cross-sector, community-based interventions to improve population health and health care outcomes (Tipirneni et al. 2015). ACHs exemplify each of the three major types of interorganizational networks. Many ACHs serve as policy networks advocating for health equity and antiracism in urban communities. All ACHs exemplify governance networks, since they establish a clear governance structure that typically includes a staffed backbone organization, a board of directors, and multiple advisory and working committees comprised of community members and organizational representatives. ACHs are also an example of collaborative networks, since they share power among members by establishing cross-sector boards of directors and engaging community residents as decision-making participants. In these ways, ACHs provide an example of interorganizational networks that function as policy, governance, and collaborative networks.

The benefits to using collaborative networks to accomplish public administration goals can also be seen in ACHs. These networks exist to improve community-wide health and well-being, which is a task that no single organization could achieve in isolation. As a first step toward achieving the lofty goals set out by ACHs, these networks focus on increasing connectivity among various organizations involved in supporting healthy communities, including public health departments, hospitals, health clinics, dentists, behavioral health counselors, school nurses, and public safety institutions, among many others. Research has shown that ACHs can effectively increase interorganizational connections and reduce working siloes across community health systems (Bultema et al. 2020). The advantage of having built strong collaborative networks became immediately evident for ACHs across Washington state, as they were able to quickly and efficiently leverage existing relationships, resource-sharing channels, and governance structures to distribute personal protective equipment (PPE) and other necessities to the organizations and community members who needed support during the first waves of the COVID-19 pandemic (Bultema 2020). They have continued leveraging the power of their networks as they assist in public health messaging, establishing contact tracing protocols, and helping to develop solutions for preventing the spread of disease through vulnerable populations such as those experiencing homelessness or incarcerated individuals. By bringing together diverse stakeholders in pursuit of a common goal, ACHs can develop inclusive and representative plans that share power among members and can quickly respond to emerging urban issues by capitalizing on the strength of the network.

Approaches to building, managing, and evaluating collaborative networks can also be seen in the case of ACHs. In their earliest stages of network-building, ACHs focused much of their efforts on building trust among network participants by hosting regular cross-sector meetings and community convenings. They worked with community members and organizations to collaboratively develop a shared vision and goals that could guide their subsequent, long-term work. The first ACHs were built between 2015 and 2017 and have since been focused on developing effective management practices. One of the most important factors to managing an effective collaborative network is ensuring the presence of strong, enduring leadership. This leadership is often seen in ACH executives and management, but governing boards are perhaps an equally powerful source of leadership in an ACH. ACHs manage their collaborative networks through careful governance structures that include governing boards, advisory groups, and work groups. They also use institutional arrangements such as charters and other agreements to build shared motivation and commitment among members. Although ACHs are still early in their development, they rely on regular evaluations to ensure their work is on track and so they can course-correct, if needed. Since the work of ACHs entails long-term, systems-level work, evaluations to date have assessed efficacy of processes. These evaluations have demonstrated the utility of using network analysis to assess collaborative networks and the importance of using a logic model or similar theory of change to guide the network's collaborative endeavors (Bultema et al. 2020; Hertel 2019). In these ways and more, ACHs exemplify how collaborative networks can be built, managed, and evaluated.

## Conclusion

Public administrators working to solve public problems must often engage across boundaries to create the cross-cutting change they seek (Kettl 2015). This means that public administrators are likely to find themselves in a position of needing to lead or participate in a collaborative network that engages diverse people and organizations to collectively address a common goal. Benefits of engaging with collaborative networks include improvements to both the processes and end results of a public organization. Although working through collaborative networks is often a requirement for public administrators and is associated with many benefits, there are also challenges that may need to be overcome. For this reason, public administrators should take time to carefully assess whether the goal they are trying to achieve really needs to be accomplished through a collaborative network or whether it can be accomplished independently or through a simple partnership with a single external organization. If it is decided that a collaborative network is indeed the best options, public administrators can draw on existing evidence showing how to effectively build, manage, and evaluate their collaborative network. ACHs offer one example of how collaborative networks can be used as public administration instruments to address complex urban issues like health equity and public health emergencies, such as the COVID-19 pandemic. Ultimately, public affairs literature shows that public administrators can effectively work through collaborative networks to advance organizational missions and broad policy agendas.

# Collaborative Public Management (CPM)

Tâm T. H. Mai
Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Confederation of public management; Cooperation of public management; Partnership of public management

## Definition

Collaboration public management refers to sharing efforts and interests in public management. Actors establish connection and association in public management.

## Introduction

*Collaborative public management* (CPM) has become popular in the study and research of public administration. CPM plays an important role in helping actors to cooperate and deal with difficult challenges. Through CPM, actors can share ideas, create new values, and achieve mutual learning. CPM occurs when all actors have something to contribute and encourage others to work out solutions for problems that cannot be addressed by only one actor. This chapter presents the definition and characteristics of CPM, including the traits and effectiveness of the network. The next part of the chapter will focus on challenges of CPM. Comments will be given in the section "Conclusion."

## Context and Factors Promoting CPM

CPM refers to the cooperation and coordination of multiorganizations in dealing with various issues (O'Leary et al. 2006). "Collaborative means to co-labor, to achieve common goals, often working across boundaries and in multi-sector and multi-actor relationships. Collaboration is based on the value of reciprocity and can include the public" (O'Leary et al. 2006, 6). The collaboration is conducted through different sectors. Organizations participating in the collaboration receive mutual benefits and use the principle of reciprocity as the key to maintain collaboration.

CPM is not new (Bingham and O'Leary 2001). In the article: Federalist No.51, "The Federalist Papers-first published in 1787-implicitly created a collaboration imperative" (Bingham and O'Leary 2001, S79). Collaboration is a requirement and a principle of the U.S. Constitution, in which all agencies from legislative, executives, and judiciaries were asked to coordinate and collaborate in daily work. Collaboration at that time was aimed at harmonizing different interests and preventing the tyranny of the majority, especially in voting (Bingham and O'Leary 2001). CPM has become the typical aspect in American federalism (Agranoff and McGuire 2003). Since the nineteenth century, collaboration has been the working mechanism between federal and local governments in every field (Elazar 1962; Grodzins 1966). The collaboration is illustrated through "bargaining, cooperation, and mutual dependence" (Ingram 1977; Pressman 1975 as cited in McGuire 2006, 34) in both formal or informal and vertical or horizontal channels for many years.

The first factors that lead to the development of the study and practice of CPM occur because there are more challenges for public organization that one organization is unable to solve the problem but requires the collaboration of different organizations (Bingham and O'Leary 2001). The growth of outsourcing, in which there is a contract between an organization and a vendor in carrying out activities that used to be performed by the organization, promotes the CPM. Additionally, many publicly funded programs lack effectiveness and CPM is expected to increase the effectiveness of these programs. Furthermore, the development of technology has facilitated the sharing of information, the exchange of ideas, and communication among different actors of collaborative governance. Another important factor is that the increasing demand of the public to be

involved in governance requires the emergence and development of CPM (Bingham and O'Leary 2001).

## Characteristics of CPM

The understanding of CPM is diverse (Agranoff 2006). The process of collaboration is only fully understood as long as the "black box" is open and analyzed (Thomson and Perry 2006). The black box refers to the five dimensions of collaboration. Five dimensions in CPM are related to the causes and outcomes of collaboration and provide mechanisms for resolving conflicts. These dimensions are governance, administration (structure, central office), autonomy, mutuality, and trust. The governance dimension refers to rules and regulations in collaboration that govern the behavior of participants. The structures and framework of collaboration are also built from the governance dimension, which does not stand still but moves to ensure that there is "jointness" among parties (Thomson and Perry 2006, 25). In collaboration, there are both costs and benefits that participants always need to take into account. Decisions are made in collaboration as the result of "mutual learning and adjustment" (Agranoff 2006, 59).

CPM is evaluated from a pluralistic approach with multistakeholders. The players play different administrative roles, yet still hold the identities of their own organizations (autonomy) and concurrently participate in the collaboration to share these identities. The administrative roles and responsibilities of parties will decide the style of collaboration and lay the foundation for parties to build their relationship. The emergence and existence of collaboration are built on collective interests, mutual benefits, trust, and reciprocity. In other words, parties only collaborate if they see that they will gain interest from that collaboration. The interest should be fair for all participants so that they have trust in one another. Parties come close to one another not only to provide information but to achieve benefits. "Although information sharing is necessary for collaboration, it is not sufficient for it to thrive. Without mutual benefits, information sharing will not lead to collaboration" (Thomson and Perry 2006, 27). After trust is achieved, it can only be maintained based on reciprocity. These dimensions are important factors in helping stakeholders and partners to decide when and how to collaborate effectively. They are also the basis for evaluating how to build a framework for collaboration (Thomson and Perry 2006).

There are different channels of CPM including strategic partnerships, networks, contractual relationships, cooperation, and coalition (Thomson and Perry 2006). "Collaboration involves interdependence, dealing constructively with differences to arrive at solutions, joint ownership of decisions, and collective responsibility that recognizes collaboration is an emergent process" (Gray 1989 as cited in Thomson and Perry 2006, 23). In CPM, participatory governance is a crucial part, which is not only focused on the government and agencies, but also the collaboration between government and citizens (Thomson and Perry 2006).

Governance is different from government (Milward and Provan 2000). While government means the formal organizations and legislative, executive, and judiciary agencies, governance is broader. Governance refers to non-state actors, private actors, and also public actors. Those actors have contracts and agreements to provide services to citizens, and government is only one of the actors that provide services. A hollow state is a "metaphor to describe the increasing reliance of the public sector on contracting with non-profit agencies and for-profit firms for the delivery of taxpayer funded goods and services" (Milward 1994, 54). In the hollow state, command and control almost do not exist, and hierarchy and market do not work because the hollow state is characterized by "joint production and having several degrees of separation between the source and the user of government funds" (Milward and Provan 2000, 243). Governance of a hollow state is used to show the relationship among stakeholders. Its participants are from all sectors, from public to private to nonprofit sectors; coordination and collaboration are the main mechanisms, and decision-making is dealt with through cross-jurisdiction (Milward and Provan 2000).

## Network

The idea of network is an important part of CPM. In networks, actors must negotiate, discuss, and coordinate to reach contracts and agreements. Everything can be changed in the process of negotiation. Networks are not stable as bureaucracy and changes inside networks are difficult to foresee and forecast as in bureaucracy. Networks are more flexible and adaptable than bureaucracy. However, that does not mean that stability is not necessary. Stability of funding, for example, is crucial for the operation of networks and "an unstable network becomes stable enough to perform reasonably well while still remaining flexible and adaptive" (Milward and Provan 2000, 253). Through networks, it is easier for parties to contact one another, show their voices, and establish new stages of cooperation. The benefits brought by networks cannot solve all problems among parties. During the process of collaboration, parties continue to learn from others and make changes so they can maintain collaboration. All parties of the network need to update information and increase their knowledge, both explicit and tacit, so they can make knowledge-based decisions (Milward and Provan 2000).

Although networks have more advantages than bureaucracies in terms of flexibility and include less command and control, they cannot replace hierarchy in bureaucracy. According to the theories of governance/network, governments are willing to transfer decision-making power to other sectors of networks in public service delivery. However, it is impossible to replace the traditional role of governments. Additionally, "networks alter the boundaries of the state only in the most marginal ways; they do not appear to be replacing public bureaucracies in any way" (Agranoff 2006, 62). Thus, a network is only one of many models to promote collaboration (Agranoff 2006).

It is not easy to evaluate the effectiveness of network because "networks must contend with the joint-production problem of multiple agencies producing one or more pieces of a single service" (Provan and Milward 2001, 415–416). Furthermore, networks must respond to the different needs of various clients. The effectiveness of a network is evaluated through three levels: community, network, and participants. There are differences of effectiveness in each level. Network effectiveness can only be achieved if at least one of these levels is effective (Provan and Milward 2001).

At the community level, with participants as principals and clients, the effectiveness is through issues related to the community (cost, social capital, the perceptions of the public). At the network level, how principals and agents deal with the issue of network membership growth, network maintenance, the services that the network provides, and the relationship inside the network are taken into account. At the level of organization, participants, agents, and clients will consider how the participants of the network generate benefits for the organizations. The outcome of a network is related to the quality of service, unit cost, cost-effectiveness, process-oriented outcome, and interorganizational trust.

## Challenges of CPM

Conflicts in networks and collaborative arrangements are unavoidable. In order to achieve success in collaboration, it is necessary to be aware of important issues. Collaboration is broader than networks. Collaboration takes time (Agranoff 2006) and witnesses various changes from both internal and external aspects of collaboration. Regarding hierarchy, there is not much change for managers despite the "increasing number of horizontal relationships crossing many boundaries" (Agranoff 2006, 57). Networks are not the same as organizations, but they do share some similarities. They also include rules and regulations. Although there are benefits in collaboration, this does not mean that all benefits of collaboration will be the benefits of each individual organization (Agranoff 2006).

Members of collaborative management have different ways of knowing (WOKs) (Van Buuren 2009). The differences cause controversies and conflicts, and prevent the development of

collective action. To deal with this issue, it is necessary to evaluate the origins of WOKs and be able to arrange those WOKs and integrate them into collaborative governance. In other words, the ability to organize different capacities as the result of different knowledge is important. Different knowledge can come from different facts, methods, interpretations, conditions, and perceptions.

Governments are optimistic to believe that as long as there is public engagement, there will be trust. This optimism is a hope more than a reality. Petts (2008) indicates that "key components of an engagement process have the potential to impact positively on trust" (821). Trust is likely to be promoted through engagement with three specific phases: representation (public and expert), collaborative framing, and decision impact. However, there is "no causal link between engagement and trust" (Petts 2008, 831). Thus, these hopes seem still to be false.

Thus, it is necessary to promote the capacity of organizing different kinds of knowledge in order to deal with challenges of CPM. The capacity organization is easily fragmented. Thus, to solve problems, not only governmental officials working under political-bureaucratic systems, but also as many non-state actors as possible should be involved in organizing capacity. All actors need to take a collaborative approach, not only by words but more importantly by action.

Furthermore, the engagement of citizens as participants is important. How about a specific structure, mechanism, and technology for participation? The answer to this question is still elusive in CPM. It is easy to say that cooperation and collaboration should be promoted but not clear in practice. The first step should make all citizens understand the emergence of CPM and its importance so they can start to participate and gradually turn collaborative public management into reality.

## Conclusion

In short, collaborative public management refers to the cooperation and coordination of multi-organizations in dealing with issues. One organization is unable to solve a problem, but requires the collaboration of different organizations. The collaboration is conducted through different sectors. Organizations participating in the collaboration receive mutual benefits and use the principle of reciprocity as the key to maintaining collaboration. Participatory governance is of great significance. However, in the process of decision-making, citizens should not only be passive participants, but, more importantly, should make active contributions.

## Synonyms

Adaptive practices; Collective action; Complexity; Social entrepreneurship

## Definition

| | |
|---|---|
| Collective action | It involves a group of individuals or organizations acting together to achieve a common goal. The cooperation referred to in this entry is the voluntary kind, where actors come together to achieve a desired outcome out of their own will. |
| Social entrepreneurial ventures | They are organizations created to benefit economically disadvantaged and marginalized segments of people in society who lack means to transform their lives. Such organizations are established to primarily to achieve a social mission. They may be for-profit or not-for-profit institutions that recognize opportunities to address social problems. They create business models combining business principles and social goals in innovative ways with the aim of remaining financially sustainable. |

## Introduction

Today's global challenges including poverty, unemployment, inequality, crime are so large and complex that that no government or single institution is well equipped and effective enough to resolve them alone. This has led to the rise of social entrepreneurial ventures, oriented towards addressing complex social problems and in the process complimenting the public sector and other actors. Such social enterprises pursue their missions and survive in a complex environment. In their quest for social outcomes, they face different challenges including diversity and changing needs of their beneficiaries, technological changes, new modes of service delivery, funding models, new ways of engagement, and increasingly complex issues in their communities. These challenges are not easy to fix and they are characterized by diverse and often conflicting values, interests, and perspectives among actors. For instance, the various stakeholders like government, donors, and civil society organizations may not agree on the definition of the "problem," whether it is a priority, or what the response should be. In a community change effort, stakeholders may not agree on the causes of poverty, the need to address it, or which strategies are most promising (Goldstein et al. 2010).

The complex nature of social problems is further depicted in their deep rootedness in systemic or structural factors, prone to interacting in unpredictable ways. A good example of such an issue would be the high rate of discrimination experienced by women at several levels in different magnitudes in society. This dynamism makes it difficult to develop a clear understanding of

the issue and even more difficult to anticipate the effects of any attempt to address the situation. Generatively, because the context evolves constantly, making the future somewhat uncertain, solutions that succeeded in the past may not work in the present or future. For instance, addressing school dropouts using bursaries was useful in the past in Uganda but staying in school today requires more than just paying tution fees. It may involve changing mindsets of the wider society about education, counselling the children, providing access to reading resources, helping to boost incomes for parents or guardians among others.

The complexity of social problems means that no single organization – government or social venture can address them. Such problems are multidimensional, continually changing, often unstable and difficult to resolve in a permanent way. Social entrepreneurial ventures are aware of the interconnectedness of these issues and therefore engage in collective action to solve the problems. They partner to gain access to resources, develop new products and processes which creates strategic advantage and unique sources of value. These collaborations provide new opportunities for organizational learning, co-creation, and co-evolution. The local communities benefit as partners develop new approaches and solutions to social and environmental problems.

## The Concept of Collective Action

Collective action is recognized as an important tool in promoting in promoting tangible social change in societies, creating improvement in local communities (Kania and Kramer 2015). It is a multi-faceted phenomenon subject to multiple interpretations and applications in given contexts. Literature describes the construct as taking various forms including the development of institutions, resource mobilization, co-evolution, co-creation, and information sharing (Poteete and Ostrom 2004). The purpose of collective action affects the level at which it is studied and analyzed. This means that the indicators of the concept differ depending on the specific objective of collective action. It is critical to identify the level at which collective action takes place for instance many scholars focus on community level collective action but not all forms of collective action take place at this level.

This entry operationalizes collective action as a group of people who work together towards a common desired outcome. In addressing complex social problems, individuals or groups of people and organizations usually collaborate in search for effective solutions. Partnerships among organizations are usually driven by the desire to gain access to resources, information, networks, knowledge and skills. The benefits of collective action include business opportunity discovery, funding, innovation, and venture growth. Social entrepreneurial ventures engage in collective action to co-opt the local community as an active collaborator in entrepreneurial efforts. This is especially common among social entrepreneurs who work toward building local areas for development.

Collective action requires that all participants have a shared vision including a common understanding of the problem and a joint approach to solving it through an agreed upon agenda for action (Thomson and Perry 2006). Measures of collective action according to Montgomery et al. (2012) include resource acquisition and co-creation.

## Resource Acquisition

Social entrepreneurs usually need a diverse set of resources in the attempt to create social change. Such resources may include finance, knowledge and skills, support, mobilization, cultural and institutional resources. It is the ability to tap into such resources that transformation of vulnerable communities will occur. Effective social value creation therefore lies in collaboration, partnerships, coalitions, alliances, and other forms of collective action bringing together different sets of resources from different actors

(Maguire et al. 2004). Resources may be shared by actors within the same sector or they may even exchange complimentary resources where each party offers unique resources to another. Pooling resources enables actors to reduce costs, increase efficiency, enhance exposure, and achieve objectives. It will also limit the duplication of efforts in solving social problems in a particular sector. Resource pooling also brings together diverse actors across sectors to provide unique input, skills, and resources to solve pressing social problems.

## Co-creation

As organizations respond to changes in the environment, they tend to work with others in order to adapt to the environment. Actors therefore interact with one another in reciprocal ways. Co-creation is a collaborative process where players across different sectors such as social sector organizations, financial institutions, government bodies, and local leaders come together to co-design and co-implement solutions to problems in order to improve the welfare of the underserved. Organizations in this process work hand in hand to implement solutions based on a shared vision. Such mutuality has roots in interdependence of organizations providing a foundation for forging common views out of differences. This happens in the form of complementariness or shared interests which are usually based on homogeneity or appreciation of issues that go beyond an individual organization's mission. It may occur when one party has unique resources such as skills, expertise that another party needs and could benefit from.

Social entrepreneurs solve complex social problems where they combine effort with other actors in the environment (Kania and Kramer 2013). Issues such as poverty, health, education, and the environment involve many different interdependent organisations such as government and the donor community because no single solution can be provided by one actor. This is why institutions come together and solve the problems collaboratively. However, such collective action should be executed in a reciprocal fashion for participating organizations to continue or expand their commitments. Once commitments are not done in a reciprocal fashion, corrective measures may be taken through negotiation or by organization reducing their commitment.

## Social Entrepreneurial Ventures in Uganda

Social entrepreneurial activity in Uganda is manifested in non-profit establishments including cooperatives, associations, and community-based organizations that work with other players in communities to improve welfare. The formation of cooperatives in Uganda dates as back as 1913 when four farmers in present day Mubende district decided to market their produce together. Over the years, the cooperative movement in Uganda has grown where people in different groups collaborate to enhance their social and economic welfare. Relatedly, Community Based Organizations (CBOs) rose to work with local communities providing services to the poor in education, health, HIV/AIDS, agriculture, peace, and conflict resolution. They engage in capacity building at the grass root levels and they particularly play a complementary role to government in local development in different parts of Uganda (Shaban et al. 2015). They interact with people in communities, define problems and together work out solutions. In the interest of social goals, CBOs create relationships with different actors including government bodies, nongovernment organisations, donors and beneficiaries. They work together to implement activities to improve welfare in marginalized communities. In their day to day activities, social entrepreneurial ventures in Uganda encounter challenges including struggling with funding for their activities and hiring staff with little organizational and professional skills among others. The different challenges make sustainability of their activities difficult which makes a number of them embrace collaborative initiatives as a way of surviving in a dynamic environment.

## Applying a Complex Adaptive Systems Lens to Collective Action

The mechanisms of complex adaptive system (CAS) have attracted many researchers from a variety of disciplines. The Complex Adaptive Systems theory (Goldstein et al. 2010) argues that organizations survive in an uncertain and changing environment which requires constant adaptation in order to survive the changing times. In this environment, there are dynamical systems with many interacting actors that respond and react to each other in constant interplay. As a result, this behavior leads to creation of even complex, complicated multilayered patterns of behavior. At each level, new structures form and engage in new emergent behaviors. Organizations are able to adapt to the changing environment by adopting new structures, new practices, and new patterns to fit into the new environment.

The complex adaptive systems (CAS) theory helps to explain and more effectively conceptualize social entrepreneurial activities as taking place in changing environments rather than stable situations. Social entrepreneurs work in dynamic environments constrained by regulatory and social cultural factors which creates their need for sustainability. This explains why social entrepreneurial ventures engage in adaptive practices in order to be responsive to changes as they occur in a complex environment. Flexibility enables them to emerge with a collaborative orientation usually establishing partnerships with funders, government agencies, clients served, and community members.

One way of adapting to the changing complex environment is by encouraging the participation of stakeholders in decision making. This allows for a free flow of information, diversity of perspective/cognitive skills, richness of interactions that become useful for the demands at the moment. When social entrepreneurial ventures interact with stakeholders in the community, they develop trust, a shared understanding of the problem is created enabling the actors to move forward collectively. They may share about the programs they want to pursue and new patterns of interacting will emerge. Learning and adaptation are likely to take place as social enterprises attempt to respond to a changing and complex environment. Social entrepreneurs are not passive actors but they tend to learn and modify and revise their structures and behaviors. As some factors in the environment threaten the success of their programs, they respond by changing their structures and behaviors through acting collectively.

The complex nature of the environment in which social entrepreneurs operate requires a leadership style that has clarity of purpose and emphasizes principles and values around how the organization operates and how employees are treated. Leadership is the process of influencing others towards achievement of desired goals in an organizational setting. The core role of a leader is to motivate teams to work towards specific objectives, ensuring efficiency and commitment to organizational objectives. In social entrepreneurial ventures, leaders create adaptability by fostering the conditions that develop organizational capacity to deal with changes in the environment. Leaders are therefore expected to create conditions where their teams interact continuously to generate solutions to problems. As employees in social entrepreneurial ventures understand their place in the organization, they are able to take initiative and as they interact with each other, they cooperate with others. Such leadership also allows employees to communicate and get involved in the solution making process. Leadership behavior that is relationship oriented fosters interconnections and enhances information flow needed for collective problem solving.

## Conclusion

The ability of a social entrepreneurial venture to sustain its activities in a complex environment is dependent identification of stakeholders with whom to work. Managers of the social organizations therefore should embrace adaptive practices where they allow employees to participate in decision making and innovative problem

solving. Employees should also be given the necessary resources to experiment with their ideas in solving community problems. Complex problems benefit from solutions that draw on many different perspectives and resources. Local beneficiaries and other actors should be part of solution generation in community change efforts because their view points and contribution are essential. It is important for social entrepreneurs to form alliances and build cross-sectoral, cross community, and public private partnerships as well as shared and distributed leadership. The social ventures should also be open to change. This requires openness to new experience, resilience, and ability to challenge the status quo and explore creative solutions.

# Collective Authenticity: A Case for Subordinates

Isaac Nana Akuffo and Kurmet Kivipõld
School of Economics and Business Administration, University of Tartu, Tartu, Estonia

## Synonyms

Attitudes; Authentic leadership; Authenticity; Collective authenticity; Culture; Linear authenticity

## Introduction

Leadership has been studied by many scholars from different perspectives (Hassan and Ahmed 2011) and these studies led to many theories of leadership such as great man theory, trait theory, and autocratic and democratic leadership theories. These are classical leadership theories, which set the platform for the study of leadership many years ago. During the twentieth and twenty-first centuries, scholars have identified new leadership theories such as authentic leadership, leader--member exchange theory, transactional leadership, transformational leadership, ethical leadership, and servant leadership. All these leadership theories primarily recognize the basic tenets of leadership, which are influencing followers' behavior even though each of these theories sees leadership from different perspectives.

In other words, these leadership theories do have some similarities and might be closer to each other than the names suggest. For instance, Brown and Treviño (2006) pointed out in their paper that ethical, spiritual, transformational, and authentic leadership all possess integrity, concern for others, ethical decision-making and role modeling attributes. However, leadership scholars have recently been drawn to authentic leadership or authenticity in the past decades (Wang et al. 2014). Such scholars argue that authentic leadership or authenticity possesses specific attributes

such as self-awareness, moral component, self-regulation, relational transparency, and balance processing, which separate it from other forms leadership (Walumbwa et al. 2008; Beddoes-Jones and Swailes 2015).

Similarly, Kernis (2003) pointed out that authenticity consists of four dimensions (awareness, unbiased processing, action and relational). Kernis (2003) described self-awareness as people who are aware of their weakness and trust in their motives, feelings, and desires in their interaction with people. He further explained that unbiased processing entails the ability of people to remain truthful with themselves by not distorting or ignoring other facets of knowledge for self-gain(ibid). Here people are expected to check both sides of the coin before concluding. He added that the third component of authenticity involves people acting in alignment with one's true self. This component of authenticity is required by individuals to make decisions without personal gain but for the general good of everybody. Finally, Kernis (2003, p. 15) pointed out that relational authenticity is "being genuine and not 'fake' in one's relationships with close to others." From these descriptions above, it could be seen that these attributes are not the preserve of one person because they are competences possessed by everyone, so it is, therefore, prudent to study authenticity from the collective perspective instead of the linear perspective.

Ilies et al. (2005) and Kernis (2003) explained that authenticity is simply remaining true to oneself. It implies that people with authenticity are fair, objective, uphold high moral standards, act in consonance with their values, and resist influence from others (Kernis 2003). Such people are in control of their emotions and understand how their weakness or strength influence the people around them.

Authenticity has been touted as the potential antidote to unethical behaviors by many authors (Owusu-Bempah et al. 2014; Neider and Schriesheim 2011; Gardner et al. 2011; Beddoes-Jones and Swailes 2015; Walumbwa et al. 2008). As such most studies on authenticity refer to ethical scandals and corruption happening in organization such as WorldCom and Enron (Owusu-Bempah et al. 2014; Neider and Schriesheim 2011; Gardner et al. 2011; Beddoes-Jones and Swailes 2015). These allusions make it imperative for organizations to hire leaders who possess the integrity or moral uprightness, self-awareness, relational transparency, and balance processing to minimize these numerous scandals (Walumbwa et al. 2008). Thus, these studies acknowledged that having an authentic leader might influence employees' behavior positively because they eschew unethical behaviors, which serve as the platform for corruption to thrive (Safina 2015).

Cooper et al. (2005) shared this view, and they argued that scholars of authenticity fundamentally believe that a new form of leadership is required because of the numerous corporate scandals that continue to occur in different organizations. These assertions seem to reiterate the emphasis of the authenticity of the leader while the subordinate's authenticity is ignored entirely. Authenticity either consist of four dimensions (Walumbwa et al. 2008; Kernis 2003) or three dimensions (Beddoes-Jones and Swailes 2015). However, existing studies cited above seems to dwell more on the authenticity (Johnsen 2018; Yadav and Dixit 2017; Lester et al. 2009; Driscoll and McKee 2007) of the leader while the authenticity of the subordinate is completely missing. For instance, May et al. (2003) opined in their study that authentic leadership decision-making thrives on identifying the intensity connected with every moral situation.

The entry argues that authenticity is a collective effort between the leader and the subordinate but not the responsibility of the leader alone. The reason for this argument is that the leader and subordinate have different inbuilt authenticity influenced by national and organizational culture (Petan and Bocarnea 2016; Lester et al. 2009; Azanza et al. 2013). It could also be influenced by the values or histories that nurtured (Gardner et al. 2005) their behaviors or attitudes. Therefore, these differences in national culture or values could influence them to behave differently. Collective congruence of authenticity between the leader and the subordinate would cause the leader to be more authentic. Still, incongruence might

affect leader authenticity because the subordinate might have a different perception of how authentic the leader is.

The argument here is not based on the position of the leader, but the authenticity attributes or underlying assumptions. Authenticity is not the preserve of one person, and as such, for the work environment to uphold authenticity, there must be congruence between the leader and the subordinate authenticity. For instance, Gardner et al. (2005) acknowledged in their study that authentic leadership goes beyond the authenticity of the leader. Congruence in authenticity means that both the subordinates and the leader must be on the same page as far as authenticity attributes are concerned.

Thus, authenticity has been observed as a linear approach by existing studies where the leader is assumed to be the only person high on integrity, transparency, and fairness. Also, they are aware of their strengths and weaknesses and possess the ability to regulate their emotions, which in turn influence subordinates to emulate such behaviors (Palanski and Yammarino 2011; Norman et al. 2010). However, this entry argues that authenticity cannot be seen as a linear approach but a collective approach involving both the leader and the subordinates.

Kernis (2003, p. 13) explained that "authenticity can be characterized as behaviour that reflects the unobstructed operation of one's true self in one's daily enterprise." In other words, authentic individuals act by following their professed morals and beliefs. They do not engage in double standards, remain true to themselves and persist even in the face of adversity and develop employees to emulate such behaviors. This assertion is shared by Sparrowe (2005), who acknowledged that if leaders fail to act per their true self or continue to change their professed true self, it might cause some form of dissonance between the leader and the subordinates.

Authenticity studies could be traced to positive organizational scholarship (Cassar and Buttigieg 2013) and humanistic psychology by Carl Rogers (1961). These fields looked at the positive side of human behavior. For instance, Rogers' humanistic theory criticized psychoanalysts such as Freud for concentrating on the negative aspect of humans. Rogers emphasized that every human has self-belief and possess the ability to make it in life. Also, positive organization scholarship similarly talks about self-belief, confidence in oneself, and the ability to withstand one's grounds on decisions taken or the ability to resist pressure to rescind one's decisions.

These theories serving as anchors for authenticity indicate that authentic leaders have self-belief, are morally upright, do not take decisions to benefit themselves, are objective, and transparent in their assessment of situations and decision-making. Probably, authentic leadership (AL) scholars (Johnsen 2018; Algera and Lips-Wiersma 2012; Hassan and Ahmed 2011) premise their argument on these assertions that having a leader who possesses these attributes shall be enough to minimize or erase these numerous corporate scandals been reported in the media across the world daily. However, this entry holds an alternative view that having an authentic leader in managing a firm may not be enough to do away with these corporate scandals but rather a collective authenticity of both the leader and subordinate are the ultimate means to minimize these unethical problems. Note that the emphasis of this critique is on the underlying beliefs of the theory (authenticity) and not the leadership position.

The entry contributes to the literature by emphasizing the need for studies on authenticity to measure the construct from a collective perspective of both the leader and their subordinates. It also contributes to the literature by stating that researchers in the field seem to concentrate much on the moral component of the leader than that of the subordinate. Moreover, researchers must endeavor to give some authenticity scenarios to respondents to determine their level of authenticity instead of just administrating questionnaires. Also, an existing study by Owusu-Bempah et al. (2014) has shown that behavioral attributes considered by two different countries to merit the authentic title leader are different. For instance, the meaning of authenticity in a collectivist's society might be different from an individualistic society. Therefore, the underlying attributes of

authenticity might not be universal, as studies currently portray. It also contributes to the literature by pointing out that because three or four dimensions are employed to measure authenticity. It is prudent to measure each dimension of authenticity differently to assess the dimensions the leader and the subordinates might be weak should future studies continue to use the questionnaires instead of the authenticity scenarios.

The following sections employ some social psychological theories, culture, and attitudes to make a case for why authenticity must be studied collectively from the leader and the subordinate's perspective and not linear perspective where the leader is seen as "saint" to bring total authentic revolution within the organization.

## Authenticity and Culture

Culture is the foundation of human life. People usually do not choose their culture because people are born into it, and it nurtures and shapes their experience. In other words, people grow before they even notice that their culture defers from another person's culture. As pointed out by Hofstede (1984) different countries have different cultural beliefs. While some countries are individualistic others are collectivists. Based on the categorization by Hofstede insight.com, countries such as the United States, the United Kingdom, Estonia, Finland, and New Zealand are individualistic while countries such as China, Taiwan, Ghana, and Nigeria are collectivist.

It indicates that different countries' culture would influence the way people view and understand life, and by extension, their view of who an authentic leader should be. Already, some authors have pointed out that factors underlying the authenticity of the leader are influenced by culture and their life story (Shamir and Eilam 2005; Wassenaar et al. 2015). Also, Owusu-Bempah et al. (2014) pointed out that people from different cultures see what constitute authentic leadership differently. They compared Ghana and New Zealand on AL and found that both countries have different views on factors that warrant the title of authentic leadership.

Based on these, this entry seeks to bring out that authenticity of the leader largely depends on the culture of both the leader and the subordinates. According to Lester et al. (2009, p. 102), "one difficulty leaders face with globalization involves retaining their moral integrity—remaining authentic to their personal beliefs—while being immersed in cultures with different value systems." The authors added that there are many cases where leaders of organizations act unethically in different countries; such as sponsoring plant with unsafe working conditions and paying poor wages even though the leader could not employ such unethical management style in their native countries (Lester et al. 2009; Global Exchange 2007). The reason is that the environment where one operates could have a negative influence on the leader and cause the leader to change their authenticity principles. It shows that there is some dissonance between the leader's personal beliefs and the people they are managing, which suggests that the behavior of the employees can influence the leader in the same way the leader can also affect the employees.

However, scholars (Driscoll and McKee 2007; Dickson et al. 2001; Paine 1997) that see authenticity as a linear approach suggest that the leader's storytelling that integrates the moral and spiritual component into the subordinates is enough to transform the culture of the organization positively because it helps to define the true values of the organization. In other words, the leader plays the most significant role in the transformation or in building the authenticity principles of the employees without acknowledging the ability of the employee also to change the inbuilt authenticity principles of the leader.

This entry and some existing studies (Petkeviciute et al. 2018; Sidani and Rowe 2018) argue that there must be congruence between the leader and the subordinate before authenticity can be achieved. Interestingly, a study by Zilwa (2016) established a dyadic relationship within the authentic followership relationship. Thus, the leader can influence the subordinate while the subordinate could also affect the leader. In most cases, during the electioneering campaign in national elections, some political leaders outline so many excellent ideas, which reflect the true authentic behavior of the leader to bring change

to its people. However, once they win power, these brilliant ideas vanish into thin air.

The question is, where did these brilliant ideas go or who changed these brilliant ideas? How come such leaders are not able to deliver on their promise? The answer might be simple; there might be incongruence between the leader beliefs and his/her appointees. Hence, they influence the leader to undertake projects that will benefit the ruling party members instead of the mass population just for personal gains. The situation is perfectly captured by Albert Bandura (1986, p. 375) that "Behavior is especially susceptible to external influences in the absence of countervailing internal standards. People who are not much committed to personal standards adopt a pragmatic orientation, tailoring their behaviour to fit whatever the situation seems to demands. They become adept at reading social cues, processing and retaining social information, and varying their self-presentation" (cited in Lester et al. 2009). It means that the environment the leader found themself can change the authenticity principles espoused hitherto by the leader. It also shows that the values of the leader and the employees are not congruent; this incongruence in values might be due to differences in beliefs shaped by the culture or values that nurtured the leader and the subordinate. For instance, Pelletier and Bligh (2008) acknowledged that nepotism, cronyism, and favoritism are the foundation for corruption, and it is a sociocultural problem.

It, therefore, suggests that the leader's authenticity is just like a stone cast in the ocean. Hence, authenticity would be swallowed by the masses of the unethical people around him/her, and they would compel the leader to become part of them which would, in turn, cause the leader to change his/her authentic beliefs. This entry argues that irrespective of the excellent characteristics of the leader which may be classified as authentic, the leader's ability to uphold such ethical virtues depend on the authenticity of the subordinates. In effect, if leaders find themself amid unethical people, they may be forced to conform to the mass' unethical behavior just to survive. In the same vein, if the leader gets surrounded by people or subordinates with strong authenticity principles, they would help the leader to uphold their authenticity principles which would, in turn, cause the leader to appear more authentic to the masses. In other words, there is a congruence between the leader and the subordinate's beliefs or values.

Unfortunately, most studies on authenticity see it as a linear phenomenon where the top leader influences their follower's behaviors. For instance, Brown and Treviño (2006) pointed out that moral managers make ethics an explicit part of their leadership plan and use their lives as role models to change that of their follower's behaviors. In other words, the authentic leader is seen as the person who possesses all the accepted values and beliefs as well as the ability to influence employees' behavior irrespective of the existing conditions the leader's faces. However, Lester et al. (2009, p. 103) asked that "how does a leader read social cues, process varying cultural information, and enact appropriate behaviors without abandoning the important internal standards that are central to his or her identity." This entry argues that it is about time researchers turn their attention to the authenticity level of the followers to see if that may also play a role in the authenticity of the leader. In other words, authenticity must be studied from both followers and the leader's perspective because inauthentic followers can cause an authentic leader to be an inauthentic leader.

The entry rests this argument on two experiments by Solomon Asch (1951) and Martin Seligman in 1972 as well as Bandura's (1977) social learning theory. The first theory is the famous experiment carried out by Solomon Asch called Asch conformity theory in 1951. In this experiment a group of people were assembled. Only one of the subjects was aware of the whole experiment, but the rest of the assembled subjects were not. The subjects were shown two cards with the first card bearing one line while the second card had three lines classified A, B, and C. The subjects were asked to select a line same as the line on the first card. Initially, all the subjects had it correct, but subsequently, the informant picked the wrong line, and it is interesting that the majority of the subjects also picked the same wrong line.

Even though the subjects noticed that the selected line was not of the same size as the line on the first card, the subjects indicated that they were scared of making a mistake and as such, they conformed with the majority decision. This experiment sums up the argument of this entry that if the culture of the people had instilled certain unethical behaviors in them when an authentic leader was placed in the midst of them, the behavior of the authentic leader could be overshadowed by the subordinates to conform to their unethical behaviors. In the same vein, when the subordinates are high on authenticity principles, they can also change the inauthentic principles of the leader. In effect, to get authentic climate, both the leader and the subordinates must possess similar or the same authentic principles. However, if there is the incongruence in values, which could be gotten by the administering authenticity scenarios to both the leader and the subordinates, then they must be given some training on authenticity principles by a third party to ensure authentic collective climate. The training would lead to authenticity congruence between the leader and the subordinates, which would ensure leader authenticity and in turn, lead to an increase in employee and organizational performance.

The entry also relied on the theory of learned helplessness by Martin Seligman in 1972. Learned helplessness occurs when subjects undergo recurring pain for a period with the subject unable to do anything to this recurring pain. If the subjects continue to try and nothing happens to save them from the recurring pain, the subjects would finally give up and accept their faith. By extension, when an authentic leader finds themselves amid inauthentic subordinates, they initially will do their best to change their unethical behavior. If the leader keeps trying and persistently meet resistance from the unethical subordinates, the leader might finally give up and accept the immoral behavior of the subordinates because nothing can be done to change such unethical behaviors, which might have become part and parcel of the subordinates due to the cultural values or the environmental nurturing.

The entry also relied on Albert Bandura's social learning theory (1977), which states that people are bound to behave similarly by observing and imitating the behavior of people around them once that behavior provides some rewards. Wu and Chen (2019) pointed out that factors such as observational learning, self-efficacy, and self-regulation are crucial for eliciting human behaviors. While scholars have used this theory to serve as the foundation for the authenticity theory, emphasis of the social learning theory is seen from the employees observing and learning from their leaders. Still, the other aspect of leaders learning from the employees is entirely missing. For instance, Wu and Chen (2019) pointed out that subordinates usually demonstrate some changes in their behavior due to the interaction or observation of the leader's attitude, again completely ignoring the perspective of the subordinates. Brown and Treviño (2006) also added that for a subordinate to accept their leader's principles, the leaders must exhibit credible and role model attributes; they also ignored the potential of the subordinates to change the leader's behavior.

From these two experiments and Bandura's social learning theory, this entry suggests that for authenticity to gain the needed acceptance, there must be a two-way (subordinates and leader) measure. This assertion is supported by Steffens et al. (2016) who found that leaders who champion the collective identity of a group are seen as more authentic by the subordinates. Also, a recent study by Wu and Chen (2019) found that authentic leadership is related to collective mindfulness and collective thriving.

Unfortunately, most studies looked at authenticity as a linear form of leadership where the leader is seen as a "superman" with abilities to use their authenticity attributes to instil the underlying assumptions of authenticity into the subordinates (Brown and Treviño 2006). However, Wassenaar et al. (2015) asked a brilliant question about the reason why people behave authentic in certain situations and inauthentic in other situations, and they acknowledged that this situation occurs because of the social pressures, cultural norms, and other specific context that adds up to influence people's behaviors. In a nutshell, authenticity must be studied from a collective or two-way approach bearing in mind that both

**Collective Authenticity: A Case for Subordinates, Fig. 1** Linear authenticity process

parties can influence each other. Figure 1 below depicts the linear process of the authenticity of how existing studies have captured authenticity. Existing studies assume that the leader is the only person solely responsible for changing the unethical behaviors or inauthenticity of their subordinates without recognizing the possibility of the subordinates to change the authenticity principles of the leader.

From Fig. 1 scholars make authenticity sound so easy to the extent that, it is assumed that once a firm recruit an authentic leader the behaviors of the subordinates might change overnight by imitating the leader's behavior. Interestingly, this belief is shared by some leading scholars of authenticity (see Ilies et al. 2005; Walumbwa et al. 2008; Wassenaar et al. 2015; Neider and Schriesheim 2011; Wang et al. 2014). The entry argues that if scholars consider authenticity as a linear process, then they may ignore an essential factor such as the potential of subordinates to influence the authenticity of the leader. Interestingly, some of these key authenticity scholars have acknowledged that the underlying assumptions of authenticity may be more than what has been described such as just being true to thyself (Walumbwa et al. 2008; Ilies et al. 2005; Shamir and Eilam 2005). Notwithstanding, they still emphasize the leader's authenticity while the subordinates authenticity is mostly ignored.

Similarly, Azanza et al. (2013) indicated in their study that organizational culture must be integrated with authentic leadership. Furthermore, Cassar and Buttigieg (2013) explained that authentic leader attributes stem from the values and moral principles the leader has undergone. These views by the authors above make it clear that culture plays a significant role in the values, morals, and beliefs of every person. Hence, authenticity must be studied from a collective perspective but not the existing linear perspective because the subordinates and the leader all come from a different cultural background with each having the ability to change.

## Authenticity and Attitudes

Attitudes are unique characteristics of an individual that distinguish one person from another. Defined attitude as a "disposition to react with a certain degree of favourableness or unfavourableness to an object, behaviour, person, institution, or event-to any other discriminable aspect of the individual's world." An individual's attitudes are enduring over time. and Greenwald (1989) have indicated that attitude influences people's behaviors. Thus, people's behavior reflects their attitude.

Also, Eaton and Visser (2008) have argued that attitude brings out differences across people in different situations. Eaton and Visser (2008) added that attitudes with a strong foundation resist change in the face of attack and continue to influence people's behavior and thoughts over a long a period as compared with the weaker attitudes that can easily be given up.

Attitude is made up of three components: cognitive, affective, and behavioral, which interact with each other to bring out one's behavior. Eaton and Visser (2008) outlined that self-interest, identification, and personal values are the main determinants of one's attitude. First, people's attitudes hinge on something that satisfies one's interest irrespective of its consequences on the other person. Second, people's attitudes are backed by the need or desire to be accepted or desire to identify with a group of people. Third, people's attitudes also stem from the values they desire to sustain. When an attitude is formed based on these enduring characteristics it becomes difficult to change irrespective of the skill of the change agent, and this is the argument put across in this entry. Some of the pioneers in the field of authenticity studies (Avolio et al. 2004) have acknowledged over a decade ago that the conceptual and empirical connection between follower attitudes and authenticity have been underexplored. This study, therefore, contributes to the literature on the conceptual part of this connection.

According to Owusu-Bempah et al. (2014), leaders and subordinates come to the organization with an inbuilt understanding of the expected relationship. What this means is that both the leader and subordinates come to the organization with different and unique attitudes built from the interaction between self-interest, personal values, and identification. Thus, when subordinates come to the organization with an attitude, which is deeply rooted in self-interest and corruption, it might be difficult to change irrespective of how authentic the leader might be.

Therefore, as time goes by, the lone authentic leader would want to identify and be accepted by the subordinates to make their work easier. Base on this assertion, authors submit that the attitudes of the subordinates can change the attitude of the leader in their quest for acceptance. Hence, scholars should appreciate that for an authentic leader to succeed and become a role model to the subordinates; there must be some compatibility or congruence between the attitudes of the leader and subordinates. This view is also shared by Avolio et al. (2004). They argued that the development of authentic leader–follower might be easy when the two parties share similar actual and ideal selves. When differences in attitudes exist between the leader and the subordinates, then subordinates have a higher chance of changing the authenticity of the leader due to their numbers. However, when they are compatible in attitudes then it is easier for the leader and the subordinates to build authentic climate, which helps to erase scandals and assist the leader in upholding their authentic principles which, in turn, enhances employees' and organizational performance.

For example, why do some football managers join a nonperforming football club and use their managerial skills to make the team play better with almost the same group of players who were hitherto not performing well? Similarly, why do some managers join a very successful football club and suddenly, the club's performance begins to dwindle? The answer lies in the compatibility of attitudes or congruence in attitudes.

If the manager and the players share similar values, interest, and identify with the broad goal of the football team, the manager would enjoy success beyond measure with the same group of players who were hitherto performing poorly. However, if the manager comes intending to change employees' (footballers) attitude, suddenly the subordinates might not accept it. The players may intentionally play poorly to register their displeasure. In such situations the only way for the manager to succeed is to accept and identify with the attitudes of the players just to get the best out of them.

The reason is that the players (employees) may have different attitudes (positive or negative) that may have worked for them to either satisfy self-interest or the interest of the football team and these may be difficult to change irrespective of how authentic the leader might be. The same analogy applies to the organizational environment, and this entry argues that subordinates have what it takes to change the attitude of the leader, which, in turn, might change the authenticity of the leader. Hence, authenticity scholars must not study the area as a linear process of leadership but rather a collective process involving both the leader and the subordinates. Shamir

and Eilam (2005) argued that authenticity essentially rests on the life experiences or story that the leader may have gone through from childhood to adulthood.

The entry argues that this same argument by Shamir and Eilam (2005) should be extended to subordinates because they also have life stories that might have shaped their attitudes, which might influence them to either behave ethically or unethically. As noted by Owusu-Bempah et al. (2014) authenticity of the leader is not a trait, but it is something which is bestowed on the leader based on the subjective subordinates' assessments of the leader's behavior. Thus, subordinates would assess the leader's authenticity within the context of their life experiences that shaped their attitudes, which, in turn, influences their behavior and; if the subordinates consider the leader's attitude as something that is compatible with their attitudes the leader may be rated as authentic and may be able to influence employees' attitudes.

This argument is supported by Wang et al. (2014). They acknowledged that even though their study supports the linear dimension of authenticity on subordinates' effectiveness, studies need to be conducted to understand the follower's personal and contextual factors that may influence the impact of authenticity on subordinates' performance. They added that since employees have different backgrounds, it is essential to find out whether AL would have the same influence on followers. This entry argues that scholars of AL must consider both the leader and subordinates' attitudes in determining the authenticity of the leader because only one authentic leader might find it very difficult to change dozens of inauthentic subordinates' attitudes.

For an authentic leader to be able to carry out their duties as being a role model for their subordinates, there must be congruence between the leader and subordinates' attitudes (Owusu-Bempah et al. 2014). Until this congruence is met, an authentic leader may not be able to influence their subordinates' attitudes positively. Wassenaar et al. (2015) indicated that authenticity is basically about being true to one's self or acting in accordance with one's acquired beliefs and values while inauthenticity, on the other hand, means people do not act as per their acquired beliefs and values. This definition ignores the fact that inauthenticity is not only about not acting as per one's acquired values or beliefs but also acting as per one's beliefs and values, but those values and beliefs may contradict the values or the norms of the organization.

This entry argues that some subordinates may have acquired some attitudes which are in bad taste before joining the organization, and such people may be acting as per their true attitudes. Hence, there must be positive congruence between the leader and the subordinates' attitudes before the leader authenticity could have a positive impact on the subordinate's attitudes. For instance, when the leader abhors soft corruption, and the subordinate is interested, it might breed incongruence in attitudes. In such a situation, a third party from outside the organization must be brought in as a change agent to offer training on attitudes and authentic principles to both parties to bring congruence between the leader and the subordinates. Here, the change agent might employ a systematic process to change the negative behaviors gradually instead of the potential sudden change process that may be used by the authentic leader.

For instance, even though corruption is seen as something that retards growth, some studies also acknowledge that corruption has a positive effect on firm productivity in some collectivist countries in Asia (Vial and Hanoteau 2010; Wang and You 2012). Therefore, employees/subordinates who see corruption as something that assists firm productivity are most likely to engage in unethical behaviors to achieve their self-interest because such negative attitudes have become part and parcel of subordinate's attitude. Such attitudes may be very difficult to be influenced by any authentic leader alone, and a third-party specialist is needed to take both parties through the tenets of authenticity principles. Cooper et al. (2005) also acknowledged the importance of training leaders to develop and build ethical standards. May et al. (2003) agreed in their study that development programs could help to build the leader's courage and how to implement such actions into their daily interactions.

Unfortunately, these studies emphasized training for the leaders only, but this entry argues that training on authenticity must be taught to both parties. That is the only means to build authentic work climate. Therefore, authenticity must be studied from both the supervisor and the subordinate's perspective (collective perspective) rather than linear perspective because each party could change the other. Note that the argument is not on the position but rather on the authenticity tenets, which is not the preserve of one person.

## Authenticity and Its Measurement

Measurement of authenticity or authentic leadership has drawn many criticisms from many authors, and this entry shares this view. Algera and Lips-Wiersma (2012) argued that the way AL is being theorized, it has the highest potential of not reaching the intended objective. This assertion is also supported by Gardner et al. (2011) who indicated that recent scholarly papers of AL have made the area very ambiguous regarding underlying the assumptions of AL. These respected authors added that this problem has arisen due to the limited number of empirical papers on AL.

Similarly, Nikolic and Halvorsen (2017) acknowledged that even though AL is seen as a positive form of leadership, there are questions about the true moral intent of authentic leadership behavior and its true positive influence on subordinates' behavior. From these authors, it could be deduced that there are clear problems with the authenticity measurement and the underlying assumptions of authenticity regarding the conceptualization of the construct. Again, Diddams and Chang (2012) added that authenticity measures must include some implicit measure. Also, Alvesson and Einola (2019) revealed some weakness in the measure of authenticity. They pointed out that the theory has a weak theoretical foundation as well as poor measurement instruments that have to be looked at by the experts in the field. They also added that the theory has poor empirical studies to support the foundation of theory (Alvesson and Einola 2019).

This entry shares the same view that proponents of the authenticity theory have measured it from a linear perspective because the questionnaires on AL have nothing on the authenticity of the subordinates. However, this entry argues that authenticity is a collective phenomenon and to understand the construct of authenticity well, employee's authenticity must also be included in the measurement. The emphasis is not on the leadership position but the tenets of the authentic leadership theory. The theory rests on the ability of people to be selfless, to control their emotions, to be aware of one's weakness and strength, and to analyze situations objectively (Walumbwa et al. 2008; May et al. 2003) in their dealings with people around them. But these attributes are not the preserve of the leader alone as claimed by May et al. (2003) that the ultimate thing about the AL theory is about the leader knowing themselves and behaving in line with their values and beliefs all the time.

The authenticity of the leader can be achieved when the authenticity of the leader and the subordinates are congruent. The only way to accomplish this is to measure both the authenticity of the leader and the subordinates. The entry argues that subordinates could influence the leader's authenticity, just like how the leader could also influence the authenticity of the subordinates. Therefore, there must be a composite measure of authenticity, but at the moment, most studies on AL measures authenticity tenets from the leader's perspective and ignores that of the subordinates. Thus, most questionnaires for measuring AL centers on the authenticity of the leader without considering the authenticity of the subordinates reinforcing the authentic linear behavior instead of authentic collective behavior from both the leader and the subordinates.

Also, the measuring of the moral aspect of AL raises eyebrows because the questionnaire simply asked respondents (subordinates) whether their leaders act in line with their values or beliefs. Still, the exact values and beliefs are not stated. For instance, Cooper et al. (2005) argued that because of the underlying tenets of the authenticity theory, leaders are expected to be given some form of authenticity scenarios underpinned with some

ethical dilemmas to study how the leaders would handle such dilemmas. While this assertion would serve the theory a great deal, this entry argues that such scenarios should be given to both the leader and the subordinates to help obtain the collective authenticity of the work environment.

Therefore, it would be good for the questionnaires to state what values or moral standards are being considered so that different respondents could examine the work environment to see if such values or moral standards exist. For instance, a multinational firm seeking to expand to some developing countries where corruption is deeply rooted may have to pay their way through the registration process just to gain faster company registration. Therefore, when subordinates are rating a leader who took the bribe from the multinational firm without stating the exact values or moral standards. The subordinates' ratings may not be directed, and as such, the responses may not reflect the true situation on the ground.

The entry also argues that in assessing authenticity, questions on authentic scenarios must be culture-specific or based on the moral beliefs of the people. Already, Owusu-Bempah et al. (2014) have revealed that respondents from Ghana and New Zealand use different attributes to characterize an authentic leader. Also, Hofstede's 1984 study has proven that even countries from the same continents have different cultural beliefs. Hence, studies that intend to use questionnaires or authenticity scenarios for measuring authentic leadership must not be universal due to the differences in political, cultural, and religious beliefs of people around the world. Also, while there are scant empirical studies testing authenticity, recent empirical studies seem to put all the dimensions of authenticity together without separating them (Farnese et al. 2019; Scheepers and Storm 2019; Han and Woo 2018; Smithikrai and Suwannadet 2018). However, studies that add all the dimensions of authentic leadership in measuring authenticity may not be able to identify which of the dimensions both the leader and the subordinates need to work on to uphold authenticity. Hence, studies must endeavor to analyze the authenticity dimensions individually to avoid concentrating only on the moral component of the theory.

Finally, it could be observed that authenticity lacks many empirical studies to support the underlying assumptions of AL (Alvesson and Einola 2019). Hence, having more empirical studies across the continents, covering the authenticity of both the leader and the subordinates, are the only option for authenticity to gain root in the annals of the leadership literature. It would help to know if authenticity is a universal construct; already, Neider and Schriesheim (2011) have pointed out that authentic measures must not be treated as a universal construct. Therefore, we need more empirical studies to assess if the dynamics of authentic principles are universal.

## Conclusions and Theoretical Implications

The essence of this entry is to widen the net of authenticity to include subordinates' authenticity. It also argued that the authenticity of the leader largely depended on the authenticity of the subordinates as well. Using social psychology theories, it argued that authenticity must not be a linear phenomenon but a collective phenomenon, because seeing authenticity from the leaders' perspective alone may lead to the neglect of subordinates' authenticity.

Hence, it is recommended that scholars must measure authenticity from both the subordinates and leaders' perspectives since they both possess the potentials to change each other's behavior. Also, the measuring items of the authenticity must include specific authenticity or moral scenarios to help capture the collective authenticity of the leader and their subordinates.

Finally, more empirical studies must be conducted from different countries so that scholars could establish a unique form of a measurement tool for respondents from different cultural environment.

## Synonyms

Collective leadership; Collectivistic leadership; Leadership in the plural; Relational leadership

## Definition

Recent theories claim that leadership does not reside exclusively in the leader but is also a property of the collective (group, organization, social system) and thus has both individual and collective qualities. The phrase "collective dimensions of leadership" signals the importance of shifting

attention from the single "heroic" leader to the emergent processes and practices that help actors interact, coconstruct meaning, and advance a common goal unattainable by themselves.

## Introduction

Complex social problems that cannot be solved by single organizations or sectors are increasingly addressed through multiorganizational and cross-sectorial efforts that engage people across boundaries to develop innovative and sustainable solutions. As a more collaborative approach takes root within the frameworks of public policy and administration, the very idea that leadership for the common good resides within a single individual leader has started to lose currency (Crosby and Bryson 2010). New interest in how to foster more facilitative, integrative, and inclusive environments to address collaborative governance challenges has also motivated questions about the nature of leadership, both in bureaucracies and network contexts. Governance arrangements today highlight the need to attend to the collective dimensions of leadership (Ospina and Foldy 2015).

The term "collective" in "the collective dimensions of leadership" implies viewing leadership as a phenomenon that implicates all members of a group rather than one or even several *individual members*. Because attention to the collective dimensions of leadership is a relatively recent development, the terminology is still in flux. "Collective leadership" is sometimes used to describe forms that incorporate more than one person in the leadership role, such as in coleadership or team leadership, or to refer to situations where the leadership role is fluid, and rotated among people, as in distributed or shared leadership. Often these variations are referred to as "collectivistic leadership" (Yammarino et al. 2012) or "leadership in the plural" (Denis et al. 2012). Focusing on the space between the leader and the follower, some stress the *relational* nature of leadership, a collective quality that operates within interactions with others. And yet others identify this collective quality with leadership in nontraditional organizational forms like networks and multisector partnerships, where more than one person is implicated in leadership roles or activities.

In this entry, "collective leadership" encompasses all theories that conceptualize leadership as an emergent, coconstructed process, independent of the manifestations it takes in the real world. The leader is reframed as the visible part of a broader process that involves many persons interacting with one another in an emergent and shifting network of relationships, and it is at this collective level that leadership happens. These theories espouse a movement from a leader-centered perspective to a collective leadership perspective, thus pointing to the collective dimensions of leadership (Uhl-Bien and Ospina 2012).

## Why a Collective Leadership Perspective Today?

Two different explanations offer justification for the need to broaden the understanding of leadership from singular to plural and thus consider its collective dimensions. Both are important and suggest different intellectual strands of a collective leadership perspective.

One focuses on broad trends and changes in society to suggest that a new and more relational form of leadership is now required. This approach, *collective leadership as trend*, explains the shift away from leader-centered perspectives by associating it with the broad changes taking place in a postindustrial society and the organization of work. In an era characterized by disruptive change and interdependence, managerial authority has declined. Instead, organizations search for alternatives to simple hierarchies, such as teamwork and strategic alliances.

Another explanation focuses on a way of thinking and viewing leadership as a social phenomenon that is always relational, independent of context. This strand, *collective leadership as lens*, proposes that any form of leadership – from top-down to collaborative – is plural. Leadership cannot be understood simply as an influence relationship between two social actors – leader and follower –

who exist in those capacities, prior to the relationship. Leadership (and those defined as leaders or followers) emerges as coconstructed meanings that help a group advance organizing tasks.

Leadership scholars espousing both perspectives agree that leadership theory must move from a heroic, leader-centered perspective on leadership toward a post-heroic, broader perspective that explores the collective dimensions of leadership. They both apply a relational lens to the leadership field, embedding the leader-follower relationship at the center of multiple intersections, acting within a broad system that shapes its form.

Public administration scholars agree that the time is ripe for a broader conceptualization of leadership beyond individuals. The point is to focus also on processes, context, and complexity and to consider actors beyond formal leaders, arenas beyond the bureaucracy, and levels of analysis such as the interorganizational and systems of networks. Phrases such as the shared dimensions of public sector leadership, public leadership as a form of collective leadership, and public followership are slowly entering the conversation.

Scholars tend to associate this with a changing public landscape characterized by networks for knowledge, information sharing, service delivery and policy reform, and the recurrent use of multi-stakeholder groups and formal public-private partnerships as policy tools. The argument is that shifts from pyramids to webs and from production to coproduction change the nature of public leadership. Leadership challenges include how to develop collaborative relationships between politicians and public managers, and between these and civil society actors, within the boundaries of legally authorized roles.

However, the required levels of collaboration are inconsistent with largely hierarchical structures, systems, and bureaucratic styles of public leadership. In fact, they reflect the paradoxical need to protect constitutionally grounded merit systems and democratic values, while adapting fluid and flexible organizational forms that promote innovation and adaptability. This means operating under old rules and vertical relationships of accountability, while introducing new rules and horizontal relationships of accountability. These conditions of paradox require collective leadership from actors in all branches and at all levels of government.

## Exploring the Collective Dimensions of Leadership

The leadership literature has increased attention to the collective dimensions of leadership. This implies moving from questions about how formal leaders' traits, styles, and behavior influence followers or vice versa to how processes and systems of relationships produce leadership in a group, organization, or system.

**From individual traits to styles and behaviors** – Leadership theories in popular culture give weight to the leader as the primary source of leadership. Leader-centered models identify personal qualities as predictors of effective leadership such as high internal locus of control, emotional maturity, and power motivation, among others.

Individual behaviors, actions, and styles enacting these traits are clustered, codified, and measured at the individual level of analysis. For example, the transformational leadership questionnaire (TLQ) includes nine factors characterizing the effective leader, such as a genuine interest in empowering others; integrity and trustworthiness; and decisiveness and determination. While helpful to offer diagnostic tools for individuals aspiring to lead, the field has recognized this offers an incomplete picture.

**From styles to relationships** – In reaction, relationship-centered and follower-centered perspectives broaden the focus of interest to dimensions like the quality of the leader-follower relationship itself. Leader-member exchange or LMX, for example, claims that high-quality relationships yield high levels of mutual trust, support, and obligation, thus influencing leadership effectiveness. But the focus is on the quality of the leader-member dyad, shaped primarily by the leader, rather than on shared or collective benefits of the exchange.

Likewise, follower-centered theories – such as the romance of leadership theory, psychoanalytic

and social identity leadership theories – emphasize the role of followers in shaping leaders, thus including more complex social processes. For example, these theories claim that followers make attributions of leadership to certain individuals in order to cope with the anxieties associated with group dynamics, usually authorizing leaders who share their beliefs, backgrounds, and identities. In this scholarship leadership does not exist without follower recognition. But the basic assumptions about the nature of leadership do not change. Leaders and followers are separate entities, taking up leadership or follower roles as individuals, even if in a more fluid way than granted by the leader-centered perspective. The epicenter of leadership remains the individual leader, enacting relationship with followers who may engage in reciprocal influence.

**From relationships to systems and emergent processes** – Theories giving priority to collective dimensions of leadership rely on different assumptions. They locate the source of leadership one level up from the individual or the relationship, in the broader system of relationships where individuals operate. In this collective space, leadership emerges as individuals interact and respond to others, with particular contexts shaping how leadership happens and the form it takes.

But these theories vary according to how they view the collective dimensions of leadership. Those who see collective leadership as trend highlight contemporary contexts characterized by decentralized decision-making, networks of relationships, and horizontal authority. Examples include distributive leadership theory, network leadership theory (NLT), and complexity leadership theory.

Distributed leadership theory, for example, sees leadership roles as decoupled from formal positions of authority and distributed across the organization. More than one leader may emerge in different locations, time periods, and task contexts. The role of the leader or follower is dynamic and reciprocal, and any person may take up one or the other given the situation. Network leadership theory (NLT) illuminates the relational structures that connect people in influence relationships and undergird attributions of leaders and followers. It assumes that microlevel interactions do not just simply add up to produce properties at systemic level. Instead the latter represents a different level of action, which is also where leadership resides. The network lens helps understand leadership across bounded contexts, including traditional hierarchies and formal interorganizational and cross-sector networks (Cullen-Lester and Yammarino 2016).

Complexity leadership theory understands organizations as complex adaptive systems (CAS), a particular type of networked system. Like in NLT, leadership emerges when networked individuals interact but with an added functional requirement: adaptability. CAS are organic and fluid networks of interacting agents engaged in the cooperative work necessary to adapt to uncertainty. Leadership appears not as a personal attribute, role, or hierarchical position. It is an emergent, interactive process *that gives capacity to group members* so they become innovative and adaptable to navigate complexity. Adaptive and enabling leaders, located across the system, are as important as administrative, formal leaders, located in positions of authority.

Those who perceive collective leadership as a lens draw on social constructionism, a social theory with great currency in the social sciences. Like collective leadership as trend, constructionist approaches view leadership, in all its forms, as a type of organizing agreement constructed in social interaction. But these approaches add another assumption: that leaders and followers are not independent bounded entities, who then engage with one another. Instead, they exist as beings-in-relation, their understanding of self created through relationship, with no separate, inherent core or status. Leadership, and "leaders" and "followers," emerge as coconstructed meanings that help a group advance organizing tasks. In this view, leadership is achieved in community, owned by the group: leadership is collective by its very nature, not just when it takes collectivistic forms. Examples of strands exploring collective leadership as a lens are discursive leadership theory and relational social constructionist leadership.

Discursive leadership theory applies a communication lens that links the emergence of leadership to language, the main way humans share

meaning and construct social reality. Switching attention from individual cognition to collective social and cultural systems, this theory emphasizes talk and discourse to understand how people think, see, and attribute leadership. Attention to discourse at the microlevel conversation and speech acts, and to discourse embedded in broader macrolevel assumptions, guides us in recognizing leadership, viewed as an emergent process of influence characterized by the management of meaning through the use of talk and corresponding actions to advance a task or goal.

Relational social constructionist leadership theory builds on the same assumptions but moves beyond discourse. Leadership is found in the *outcomes of the group's work*, not in specific individuals producing it. Leadership happens when the results of the individual efforts of interdependent actors are experienced as collective achievements, hence its collective meaning. This lens assumes that meaning-making processes associated with leadership become visible as *practices – recurrent ways of doing things that have produced the desired outcomes* and thus are viewed as good solutions to problems of organizing.

Hence leadership is not something that the leader, as one person in a position of authority or having taken up a leadership role, possesses. Instead, leadership is collective work and can be identified when members of a group find a path forward, commit to it, and adapt to changing circumstances.

## Collaborative Governance and Collective Leadership

While many scholars in public administration and policy continue to explore leadership from a leader-centered perspective, others have started to explore its collective dimensions, both through lens and trend perspectives. These public leadership scholars explore the type of leadership capabilities needed for effective leadership work, including how to develop the organizational capacity to achieve extensive gains for the common good. Some explore how integrative leadership fosters collective processes of negotiation and deliberation for tackling complex problems requiring joint action across sector boundaries. Others focus on the work of leadership as a collective effort to see how nonprofit groups set direction, adapt to fluctuations, and mobilize allies for joint action to leverage power for social change.

Likewise, scholars interested in collaborative governance explore effective leadership in nonbureaucratic contexts, like interorganizational networks. This scholarship has proposed facilitation as the distinctive leadership quality, as leaders – positional and informal – create the conditions for members to contribute to the collaborative process. Steward, mediator, and catalyst roles are more or less salient at different times and in different people depending on collaboration conditions (Ansell and Gash 2012).

Challenging a leader-centric paradigm, some collaborative governance and public leadership scholars have also identified a variety of sources of leadership in networks, activities, processes, and structures. For example, leadership activities that advance the network's work include managing power, controlling the agenda, representing and mobilizing member organizations, empowering members, and constructing the right community. Processes like stakeholder meetings, public meetings, and large conferences become leadership spaces where participants bring different ways of knowing and develop common ground for action, softening the boundaries of their prior identities. Participation in structures like councils, committees, and alliances generate shared meaning and shape the work without the need of a formal leader. These structures become convening mechanisms, foster group agreement, help set deadlines, and clarify expected roles and accountability relationships. Thus, leadership becomes a collective achievement rather than an individual capability.

## Implications and Conclusion

Highlighting the collective dimensions of leadership has implications for leaders and leadership in

public administration and public policy (Ospina and Foldy 2015). First, practicing collective leadership requires that effective leaders confront their expectations for a heroic leader motivating or even empowering followers. It means recognizing and nurturing other sources from which leadership can emerge, supporting other participants to take up leadership, and designing distributed leadership processes and structures.

Second, the public management literature documents that, while network structures and processes may generate more distributed forms of leadership, formal leaders also engage in more direct complementary action inside and beyond the network boundaries to ensure change. Sometimes dual leadership structures allow two visible leaders to share authority and develop complementary roles for the network, one more collaborative, one more directive. A collective leadership perspective can thus combine collaborative and directive behaviors, weaving together a facilitative function attending to relationality and a driving function attending to outcomes. The formal leader adapts, interprets, and differentiates in meaningful ways the unique quality of dyadic and group relationships.

Third, previous research on traditional forms of leadership has often abstracted actions or behaviors from their contexts. Much of the work on collective leadership sees context as a fundamental characteristic of the story, a core element. Collective leadership understands how context both frames the perceptions and activities of leaders and followers and is generated and shaped by leaders and followers. Using a context orientation surfaces invisible social dynamics that affect leadership perceptions and authority, such as how gendered images of leaders and leadership can work against collective approaches. A contextual orientation demands attention to the ingrained assumptions influencing workplace interactions that reproduce leader-centric practices when the environment calls for more collective approaches to leadership. Once these are visible, it is easier to counteract them directly.

Fourth, collective leadership by definition transgresses boundaries we often take for granted. Opening up leadership to those outside the boundary of traditional positions that grant authority represents a first step towards obliterating the boundary between leaders and followers. In addition, collective leadership incorporates practices, such as humility and vulnerability, outside the bounds of conventional leadership behaviors. It values a process and contextual orientation, comfort with ambiguity and paradox, and commitment to continuous learning. Moreover, leaders emphasizing the collective dimensions of their work often create bridging experiences by using objects – an initial feasibility study, a website, a memorandum of agreement – that enable participants from "different worlds" to work together to develop joint outcomes. Part of the formal leader's work is to steward the design of these boundary experiences and boundary objects that highlight the collective dimensions of leadership.

Finally, for leaders promoting democratic governance, these implications suggest accepting that *engaging others* in making human life more livable *is* public leadership work. Leadership is about facilitating joint work to build a new reality where new frames and unforeseen actions emerge. When the group jointly owns these frames and solutions and puts them at the service of the common good, we see collective leadership happening in the public realm.

## Collectivistic Versus Individualistic Work Culture: A Theoretical Perspective

Isaac Nana Akuffo
School of Economics and Business Administration, The University of Tartu, Tartu, Tartumaa, Estonia

### Synonyms

Collective and individualistic work culture; Experience; Flexible work structure; Knowledge transfer; Multinational enterprise; Organizational culture; Virtual work structure; Work culture model

### Introduction

Work structure and work culture have been subject of interest for decades, and there is an ongoing debate regarding whether work structure serves as the platform for work culture to thrive or whether work culture serves as the platform for work structure to thrive. For instance, Husain (2015) argued that work culture plays a crucial role in ensuring that the work environment or work processes are well organized and standardized to ensure smooth operational activities. However, the interest of this entry chapter is not to establish which of these two concepts influence each other as it has been argued in the literature that works culture is intrinsic while work structure is extrinsic (Janićijević 2013).

The interest of this entry chapter is to draw the attention of multinational enterprise (MNEs) or firms to the dwindling nature of work culture due to the new work structure adopted by many MNEs or firms to maximize profit or get closer to their customers (Akuffo 2018). Thus, recent work structure adopted by MNEs or firms is gradually killing a sense of community, values, norms, beliefs, and stories that reflect in employees work behavior and attitudes. Work structure primarily refers to how workflow, authority, and communication are arranged within the organization. A good work structure ensures better communication and organizational performance because a good work structure would reduce all the waste in the system. Some examples of work structures are functional, divisional, matrix, mechanistic and organic structure, and global factory structure (Akuffo 2018; Buckley 2009).

Apart from these work structures mentioned above, there is a new work structure employed by MNEs or big firms in developed countries called flexible work structure or virtual work environment. This flexible work structure or virtual work environment offers the opportunity to its staff to work from home or work from different geographic regions via online resources. With this type of structure, employees do not come to the office daily but meet once or twice monthly. Regarding the virtual environment, employees might visit the mother firm once or twice in a year or might not even visit the mother firm at all.

Even though this flexible structure offers some advantages to the organization in the form of reduced cost in payment of utilities such as electricity, water, internet usage, and to some

extent expenses on beverages, this entry chapter argues that the negative effect of this work structure far outweighs the positive effect mentioned above with key among them being erasing of work culture. Other effects also include the possibility of employees to reveal firm secrets to competitors or a vital strategy of the firm which may accidentally fall into the hands of competitors. Also, lack of belonging, low emotional, and psychological support might be experienced, which might influence employees' intention to quit. This view is also supported by Triandis et al. (1988, p. 323) who pointed out in their study that "allocentric (collectivistic) persons perceive that they receive more and a better quality of social support than do idiocentric (individualistic) persons, while the latter report being more lonely than the former."

Therefore, the interest of this entry chapter is to draw attention to the declining of collective work culture, which is gradually leading to individualistic work culture, which emphasized "I" instead of "We." The "I" syndrome means that people think about themselves alone and how to meet their target but do not care about other employees work and the general health of the organization. On the other hand, the "We" syndrome show concern for himself and others and the general health of the organization. Similarly, Triandis et al. (1988) argued that individualistic culture breeds self-reliance with the competition, low concern for in groups, as well as distancing themselves from the ingroup members. They added that individualistic persons value individual goals than the overall goal of the group. The "We" syndrome assists in knowledge transfer (Phung et al. 2016), job involvement (Taştan and Türker 2014), and increase firm performance (Nazarian et al. 2017; Zehir et al. 2011).

This entry chapter contributes to the literature by outlining some propositions and models to enlighten leadership of MNEs or firms to uphold work culture and not just work culture but collective work culture since it offers more opportunities than individualistic cultures. The entry chapter also contributes to the literature by showing that fewer studies on individualistic and collectivistic culture have been examined from the organizational perspective.

## Individualistic Versus Collectivistic Work Culture

As indicated above, the purpose of this entry chapter is not to establish whether work culture influence firm's structure or vice versa but to make a case that with the new flexible work structure employed by MNEs or firms. Triandis (2001, p. 908) defined culture as "what has worked in the experience of a society that was worth transmitting to the future generations." Triandis further argued that culture includes elements such as shared standard operating procedures, norms, values, and beliefs of a specific group of people or an organization (ibid). There is a potential for work culture to be erased or collectivistic culture to dwindle. In this entry chapter, work culture is defined as "a system of assumptions, values, norms, and attitudes, manifested through symbols which the members of an organization have developed and adopted through mutual experience and which help them determine the meaning of the world around them and the way they behave in it" (Janićijević 2013, p. 72).

Work culture is essentially the way of life of employees within the organization. It reflects the values, norms, beliefs, stories, and the symbols of a group of people. Culture assists to build both internal attributes which are not visible (beliefs, values, and norms) and external culture attributes which are visible such as company buildings, attire, and firm symbols. Janićijević (2013) argued that a firm with a solid culture influences its employees to make decisions or take actions in a similar fashion. For instance, if a firm inculcates work culture such as disciplined, sense of community, hard work, loyalty, and citizenship behavior into its employees, such employees are bound to behave in the same or similar way due to collective work culture bonds they share.

Different authors have well-studied culture over the past decades (Triandis 1994, 2001; Realo et al. 1997; Hui et al. 1995; Triandis et al. 1988; Hofstede 1984). Hofstede studied many countries and outlined national culture into different dimensions such as collective and individualistic culture, power distance, masculinity versus femininity, and uncertainty avoidance (Hofstede

insight.com). After Hofstede's classifications of national culture, researchers started to show interest in examining work culture to see its impact on employees and the organization.

Early studies on work culture centered on task and relationship orientation culture. Also, Cameron and Quinn (2006) added four work culture dimensions which are clan, adhocracy, market, and hierarchy. However, studies examining the influence of collective and individualistic work culture on employees work behavior are quite scant in the literature despite the modern trends of work culture which seems to be shifting to more of individualistic work culture where employees primarily work alone.

Even though this entry chapter aims to make a case that collective work culture would assist MNEs to achieve the overall organizational goal, it also sought to bring to the fore that individualistic and collectivistic culture has primarily been looked at from a national or country perspective but from the organizational perspective is underexplored. The table below presents the number of studies obtained so far on individualistic and collectivistic studies within the context of organizations. The essence of this table is to draw management and international business expert's attention to the scant studies on these dimensions within the organizational context.

From Table 1 above, individualistic and collective culture have received little attention from the organizational perspective. Even though this entry chapter is not a systematic review paper, the table above was presented to make a case for more studies to examine which of these two work culture dimensions might bring forth the needed employee and organizational performance.

From Table 1, it is seen that collective work culture is likely to yield positive influence on the firm than individualistic work culture. As pointed out by Hui et al. (1995), collectivism work culture brings forth feelings of belief and behavioral intentions underpinned by solidarity and concern for others which serves as some form of support for each employee. This collective support herein referred to as "we syndrome" serves as buffers to reduce work stress. Employees support each other in terms of any problem be it family-related or work-related. There is a sense of community as compared to individualistic work culture underpinned with lone behavior where people do not care about each other's feelings or individual problems.

Even though research findings on work collective and individualistic culture are not consistent (Sosik and Jung 2002), this entry chapter argues that collective work culture would uphold and instill work culture into its employees than individualistic work culture where employees are made to work in a virtual environment most of the time or meet sparingly for general meetings which might kill work norms, beliefs, and values. MNEs or firms may be able to inculcate their values, norms, and beliefs into their employees when employees spend more time together within the organization and interact with colleagues daily than employees who meet occasionally.

Employees meeting sparingly might not absorb the full work values, beliefs, and norms that could make employees behave in the same manner, and this, in turn, decreases a sense of community but instead increases individualistic work culture. Most top organizations are operating a virtual work environment where employees are spread across the world to help capitalize on different skills. Even though this idea might not be wrong, firms are implementing this flexible work structure risk losing its work culture built over the years. In other words, short-term success may be great, but the long-term effects may be disastrous. Reason for this assertion is that no organization can exist without having work culture. Work culture guide employees to work with some ethical standards. Based on the argument and the literature above, the paper proposed the model as in Fig. 1.

From the model above, the paper argues that collective work culture would yield good results for the organization more than the individualistic work culture. The reason is that too much flexibility where employees spend much time alone or work from home or visit the organization for general or team meetings occasionally may decrease collective work culture which encourages employees to look out for one another irrespective of the national culture of the country where the MNEs or firm is located. For instance, Triandis (2001) indicated that people who share in collective culture merge themselves with their ingroup as well as taking a step

**Collectivistic Versus Individualistic Work Culture: A Theoretical Perspective, Table 1** Studies on individualistic and collectivistic work culture

| Author(s) | Country data was gathered | Design | Findings |
|---|---|---|---|

| Rego and Cunha (2009) | Portugal | Survey | Collectivist individual had higher effective well-being than individualists |
| Mockaitis et al. (2012) | 32 countries | Survey | Negative relationship between collectivism and task conflict. Collectivist orientation is associated with more favorable impressions regarding global virtual processes |
| Umans et al. (2016) | Sweden | Survey | Increasing degree of collectivistic organizational culture has positive influence on job satisfaction, life balance, and life satisfaction |
| Hoorn (2014) | 16 countries | Survey | Higher individualism was strongly associated with more sophisticate management practices |
| Saad et al. (2015) | Taiwan and Canadian | Survey | Individualistic Canadians generated higher-quantity ideas, while collectivist Taiwanese generated higher-quality ideas |
| Noordin et al. (2002) | Australia and Malaysia | Survey | Horizontal collectivism was positively related to career identity commitment in both Australia and Malaysia |
| Hui et al. (1995) | Hong Kong | Survey | Collectivist employees reported higher satisfaction with work, promotion, supervision, and co-worker than individualistic employees |
| Shim and Steers (2012) | Japan and Korea | Survey | Managers at Toyota exhibited higher uncertainty avoidance, while Hyundai exhibit higher ingroup collectivism and assertiveness |

Prepared by the author: 2019

further to sacrifice themselves for their ingroup. However, individualistic people tend to be more focused on being unique and engaging in activities that make them the best.

MNEs or firms employ employees from different countries with different cultural beliefs, values, and norms; and it is, therefore, essential for the organization to institute work culture that would cause employees to adopt the firm's culture so that employees can work in harmony. If employees with different national culture are made to work alone, it would be difficult for such employees to embrace the firm's culture because each would keep to their national culture which may contravene the firm's culture.

Hence, MNEs or firms that employ flexible work structure or virtual work environment must try to make employees meet at least three times a week to build a sense of community to help internalize the firm's culture. Even if the firm has employees spread across the world, effort should be made to bring such employees to the mother firm every 3 months to spend some time with the mother firm to help instill their norms, values, and beliefs into such employees. It would help to build one voice and one behavior which would, in turn, increase employees and the organization's performance. The entry chapter, therefore, proposed that:

**Collectivistic Versus Individualistic Work Culture: A Theoretical Perspective, Fig. 1** Collective and individualistic work culture model

1. Collective work culture will increase employee and organizational performance than individualistic work culture.
2. Collective work culture will build work values, norms, and beliefs into employees more than individualistic work culture.
3. Collective work culture will offer psychological and emotional support for work colleagues than individualistic work culture.
4. Collective work culture will increase employees' level of work satisfaction and commitment than individualistic work culture.
5. Collective work culture will increase the generation of quality ideas as compared to individualistic work culture.

## Collective Versus Individualistic Work Culture and Knowledge Transfer (Work Experience Sharing)

Experience is something that cannot be quantified because it is intrinsic or cannot be seen unless the person performs the task before one could prove that he/she has the necessary skill to perform the said task. The only way a footballer or accountant or management expert can prove his/her experience in the field is by performing the exact task he claims to know. Nonetheless, work experience is key in every field of endeavor because having some experienced people within the organization helps to pass on acquired experience onto the new or junior employees.

This helps to reduce the cost organizations might incur at the entry-level training of workers. In other words, on-the-job training or apprenticeship is one of the keyways employed by firms to inculcate firms' culture into employees. It also assists in transferring knowledge to colleagues and junior colleagues. It is not for nothing at all that organizations always request for some years or level of experience when jobs are advertised. Employing someone already experienced reduces some burden on the organization in terms of the cost of training. Similarly, football teams spend so much money to buy highly skilled players, and the underlying idea is that the experienced footballers already have skills to deliver and as such the team can benefit more than buying a novice who probably needs some years to mature.

One good thing about experience is that experience can be shared or passed on from person to another. However, it can only be done in an environment that supports such sharing of experience or transfer of knowledge. This entry chapter, therefore, argues that collective work culture environment would support the transfer of knowledge or sharing of experience more than individualistic work culture. Reason for this argument is that when employees work closely together and interact frequently, younger employees would learn from their senior colleagues by looking at the way the work is performed. It would also ensure that work culture is passed down to colleagues and junior colleagues.

However, when employees work alone or via online resources or meet occasionally, such work structure might not encourage knowledge transfer or sharing of experience as co-workers may be individual-centric. They might not know each other, or even if they do because they do not interact daily, it might be challenging to learn from each other. It is only after frequent interaction that the strength and weakness of each employee could be known which would, in turn, cause colleagues to learn from each other.

In other words, a work structure that encourages individualistic work culture might find difficult it to pass on knowledge to colleagues or junior colleagues. Mäkelä et al. (2012) indicated in their study that interpersonal similarity encourages knowledge sharing within the organization. Findings imply that people who share the same beliefs, values, and norms are similar in behavior and, thus, feel at ease to transfer knowledge from one employee to another. Similarly, Michailova and Minbaeva (2012) established that espousing, enacting, and internalizing the value of dialogue as a core organizational value are significant factors that assist knowledge sharing between colleagues working within an organization.

These findings support the argument that firms or MNEs that instill its culture into its employees help to share beliefs, norms, values, and the overall goal of the organization. In other words, because of the similarity in thought, employees find it easy to transfer knowledge or share experience with each other based on each other's weakness. This entry chapter argues that this feat can only be achieved when the firm employs collective work culture where employees are bonded by the same work culture. However, if a firm or MNEs encourage an individualistic work culture where employees are not bounded by any work culture, transfer of knowledge or sharing of experience may be limited.

Also, Warrick (2017) argued that for leaders to achieve the best results for the organization, they must try as much as possible to align organizational strategies and decision-making to their cultural values. The author adds that this act not only influences organizational performance but also enhances morale and productivity and motivates and minimizes the turnover rate of the firm's employees. This indicates that firms must have its culture (collective) built into its employees as culture encompass every activity within the organization.

The question this entry chapter is asking is that how can employees learn from their colleagues when they rarely meet due to flexible work structure or virtual work structure. Even though employees in such a work environment might be aware of the organization's culture, he/she might not share in that belief because they hardly use them daily. This might also affect how employees transfer knowledge because of lack of trust among colleagues as everyone will be interested in finishing its work than looking for out each other as characterized by individualistic work culture environment. This means that organizations might have to spend a considerable amount of money on organizing training for their staff regularly. However, if employees always meet and share in the collectivist work culture, transfer of knowledge is much easier because trust in colleagues might be high as compared to an individualistic work environment.

Rego and Cunha (2009) argued in their study that higher affective well-being is usually experienced by employees who work in collectivist work culture underpin by the camaraderie work environment. This entry chapter argues that work environment characterized by a spirit of camaraderie builds trust among colleagues because they spend so much time together, and this behavior

assists in the transfer of knowledge or sharing of experience to younger colleagues or co-workers.

On the other hand, a work environment characterized by a lack of camaraderie lacks trust among its colleagues or co-workers, and that might limit the transfer of knowledge or sharing of experience. Such a work environment is underpinned with individual-centric beliefs, and this might be caused by the lack of opportunity by employees to interact daily. Also, Rego and Cunha (2009) found that employees who express preferences for collective work culture are much happier than employees who work in individualistic work culture (solitary work structure).

The feeling of happiness is experienced because it is easier for employees to reach out for explanation in connection with some problematic work situations for immediate help, thus, influencing the smooth transfer of knowledge and sharing of experience. However, in a solitary work culture where individuals are made to work alone either from home or within the organization or from a virtual work environment, such citizenship behavior may be lacking.

This argument is supported by Mockaitis et al. (2012) who pointed that, apart from culture serving as a barrier for global teams, global teams also face the problem of not observing their team members actions and inactions in the course of communication. They pointed out that collective work culture has a decreasing influence on task conflict. This situation occurs because employees who spend time together and interact frequently knowing their required duties and procedure outlined within the organization.

However, employees who work from the virtual work structure or interact less frequently may have task conflict because clear work duties might be challenging to follow or assigned. When employees have clear duties and procedure spelt out in the discharge of their duties, it could assist in knowledge transfer or sharing of experience because employees would know their colleagues or co-workers to contact in case of any difficulty for a faster solution.

This section of the paper essentially argues that, working in collective culture ensures secure transfer of knowledge and sharing of work experience from senior members to junior colleagues or among co-workers than working in individualistic work culture. The reason has been that collective work culture interacts daily and engages in several activities that build bonds, and as such it is easy for employees to solicit the views of co-workers or senior workers in the event of any difficulty in discharging their duties.

However, if employees work in an individualistic work environment where there is less interaction or no interaction at all (virtual work structure), employees may not be able to build this cohesive work environment because each employee is given a task with a deadline. As such, individualistic work culture may only be interested in finishing their respective task without finding out the general health of the organization or showing concern for other employees. In other words, in individualistic work, culture employees may not engage in organizational citizenship behavior as compared to collective work culture environment where each employee believes that the success of the organization depends on the total output of all employees.

Therefore, employees may be willing to go the extra mile to ensure that employees who are having some difficulties in the performance of their duties are assisted, and this, in turn, leads to transfer of knowledge or sharing of experience. In a nutshell, collectivist work culture shares in the belief that the whole is greater than the sum of its part. From the studies gleaned from the existing literature, the model in Fig. 2 was proposed to support the proposed hypotheses.

This entry chapter argues that collectivist work culture would ensure easy transfer of knowledge or sharing of experience among workers than individualistic work culture because the work environment encourages that. They also share the belief that the whole is greater than the sum of its part. Increase in knowledge transfer or sharing of experience also increases employee and organization performance than individualistic work culture. Collective work culture also enhances employees' motivation, loyalty, trust, and morale, which in turn influence employees to also share the experience or transfer knowledge. Also, increased employee

**Collectivistic Versus Individualistic Work Culture: A Theoretical Perspective, Fig. 2** Individualistic and collectivistic work culture and knowledge transfer (experience)

motivation/loyalty/morale/trust increases employee and organizational performance. Therefore, the following hypotheses were proposed:

1. Collective work culture will increase knowledge transfer (experience) than individualistic work culture.
2. Collective work culture will increase employee level of work motivation/loyalty/morale/trust than individualistic work culture.
3. Collective work culture will increase employees trust among co-workers than individualistic work culture.
4. Collective work culture will decrease training cost than individualistic work culture.
5. Collective work culture will decrease task conflict than individualistic work culture.

## Conclusions

As argued by Warrick (2017), strong work cultures imply that employees have a clear understanding of the organization's values and norms as compared to weak cultures. This entry chapter argues that strong culture refers to collective work culture, while weak culture refers to an individualistic work culture where employees do not share in the beliefs and norms of the organization they work.

Collective work culture by nature encourages the sharing of ideas, whereas individualistic work culture by nature does not because the law of reciprocity underpins collective work culture. Hence, employees are always willing to offer help to each other so that the same act could be reciprocated when the need arises. Interestingly, Sağ et al. (2016) have also acknowledged that team culture and climate are weak drivers of multinational team performance. This finding indeed calls for more studies on collectivistic and individualistic work culture within the context of organizations.

It is, therefore, recommended that future research on work culture should not just look at the culture as a lump sum but rather try to establish which of the work culture dimensions might yield positive influence on the fortunes of the organization especially collectivistic and individualistic work culture. Preferably longitudinal data gathering must be employed to find out if indeed the model proposed in this entry chapter could be confirmed.

Quite a few studies on work culture employ students as their respondents; hence, future studies should endeavor to gather data from workers who

might have experience work culture within the organization they work. This would help to obtain data that reflects the actual situation within the work environment. Also, the management or international business researchers or researchers interested in work culture must turn their attention to collective and individualistic work culture within the context of organizations.

In conclusion, the paper argues that an organization must endeavor to build a unique collectivist work culture and try to instill it into its employees. This would help in knowledge transfer or sharing of experience and enhance employees' level of motivation/loyalty/morale/trust. It would also increase a sense of community, norms, values, and beliefs. Finally, it would also offer psychological and emotional support, and all these positive work factors would influence employees and firm performance. However, individualistic work culture decreases these positive factors, which in turn decreases employees and firm performance. Hence, MNEs or firms moving toward individualistic work culture or virtual work environment must be cautious because it might hurt the fortunes of the firm.

# Colonial Administration in Nigeria

Abdulrasheed A. Muhammad
Department of Political Science,
University of Ilorin, Ilorin, Nigeria

## Synonyms

Colonial government; Colonial policies; Colonial rule; Colonial situation; Colonialism

## Definition

Colonial administration in Nigeria refers to the deployment and management of human and material resources found in Nigeria to achieve the objectives of the colonizing country, that is, Britain.

## Introduction

Colonialism is part and parcel of another phenomenon called imperialism. While imperialism is a form of indirect economic exploitation, colonialism is more direct and incorporates direct political control of colonized lands for the purpose of economic exploitation. Although imperialism has been ongoing, the desire to provide political backing for economic exploitation led to colonialism. In an attempt to explain imperialism, theoretical postulations have emerged which includes the dependency scholars represented by Johan Galtung and the radical school typified by Vladimir Ilyich Ulyanov, better known by his alias Lenin. Both categories of scholars, however, believed that imperialism and the consequent colonialism is characterized by disharmony of interests between the advanced countries and developing or underdeveloped countries of the world.

Colonialism is, therefore, the direct control of foreign land by another country. It typically depicts an asymmetric relationship between a powerful and weaker country. It is a phenomena occurrence that started in the sixteenth century arising from developments in Europe and can be explained at two realms. First is the economic deterministic argument which states that the industrial revolution (which replaced slave labor) that took place in most European countries led to decisive changes in the volume of production of goods and services. Consequently, the ensuing overproduction led to the search for new sources of raw materials and a place to dispense finished products. This search led to discovery of new entities where this objective can be realized. In other words, colonialism is a political consequence of distortions in European economy. Second is the strategic argument, and in this

sense, colonialism could be seen as the product of rivalry for supremacy among European countries. In this case, the drive to occupy foreign lands has to do with projection of national power among different European countries. Since each country is desirous of increasing its national power, a strategy adopted is to bring as many as possible country under its control. This manifested in colonialism. This scenario may be justified by the Berlin Conference of 1884–1885 where African territories were partitioned among European powers. However Lugard in his dual mandate has tried to project the view that the scramble was between France and Germany and Britain was merely "unwillingly" compelled to participate. However, from whatever angle it is viewed, colonialism is both a political control and economic exploitation of a foreign land by another powerful country.

In Nigeria, there had been an ongoing economic exploitation of the territory before formal colonialism. Although this has hitherto been by private European companies, the partitioning of African countries at the Berlin Conference of 1884–1885 marked the beginning of formalization of the occupation of the Niger territory. At the conference, British rights over the territory now known as Nigeria was recognized by other European powers. It is important to stress that through the use of bogus treaties that the native rulers often did not comprehend and manipulative forceful arrangements, the British increased their political encroachment in Nigeria which was formalized after 1885 especially with imminent threat of competition from France and Germany. The stage was thus set for formal colonization and administration of the territory. The purpose of this entry is to examine how the territory administered in order to unravel the rationale for colonial administration in Nigeria, the strategies of colonial administration in Nigeria, as well as understanding the impact of colonial administration in Nigeria.

## Objectives and Strategies of Colonialism in Nigeria

Basically, colonial objectives in Nigeria as elsewhere were basically two: first, economic exploitation of the colonized territory through trade and, second, political control of the colonized territory in order to consolidate its economic activities and remain relevant as a power bloc. These two objectives greatly determined the administration in the territories. Following the partitioning of African territories at the Berlin conference, Britain was formally recognized by other European powers as being in charge of the territory now known as Nigeria. Britain consequently chartered the Royal Niger Company to carry out legitimate trade and oversee the territory. The switch towards legitimate trade was sequel to abolition of slave trade by the European countries championed by Britain itself in the early nineteenth century. Slave trade and slave labor were declared illegal by Britain, and other European countries followed suit. The implication of this was that, the industrialized countries need to establish a new source of national power in order to remain relevant. This desire was fulfilled in the acquisition of foreign territories. The 1884–1885 conference was, therefore, a legitimization of European domination of foreign territories. Indeed, the slave trade presented two paradoxes. It conferred economic benefits on Europe and North America and, at the same time, injustices on the countries that were colonized. It can thus be argued from an Africanist perspective that as a result of the slave trade and colonialism which grew out of the slave trade, the development aspirations of Africa have remained stultified.

As mentioned earlier in this work, the Royal Niger Company was trading and administering the Nigerian territory on behalf of Britain. However, by 1900, the charter of the company was revoked, and Britain formally took charge of administering the Niger territories. Earlier before 1900, Britain had forcefully through superior military power annexed Lagos in 1861 and pronounced it a crown colony. The then king Kosoko, who appeared to be resistant to British occupation, was dethroned and banished to Ikorodu, an outskirt of Lagos. A new king was installed and with that effective occupation of Lagos was concluded. From here, the colonialists have a base from which they launch themselves further into the hinterland of the Niger territories.

It is important to stress that while trading activities was going on, there were gradual attempts to establish formal political control over the Niger territories through gradual penetration and annexation of the hinterlands. Already it had made inroads into the hinterlands with the appointment of John Beecroft as the consul to the Bights of Benin and Biafra in 1849 before the formal declaration of Lagos as a crown colony in 1861.

Colonialism was entrenched in Nigeria through different strategies that include trading activities, activities of missionaries, diplomacy, and military strength. First, colonialism in Nigeria was aided by the trade activities and political meddling of the Royal Niger Company led by Goldie. The company which had its headquarters at Lokoja was incorporated by British nationals who remit huge tax returns to London. In the course of trade, the company entered into treaty agreements with some entities in the northern part of now Nigeria such as the Sokoto Caliphate, Nupe, and Gwandu emirates. While on trade missions, there were usually some form of political meddling in the areas which made it easy to establish formal political control later. Also, sequel to the recognition of British rights over the Niger territories after the Berlin Conference, Britain declared the formation of the Oil Rivers Protectorate which consisted of the Niger Delta region and Calabar where the Consulate General resided. The territory was renamed Niger Coast Protectorate in 1894 comprising the Niger Delta, Calabar, Lagos Colony and Protectorate, including the hinterland, and northward up to the Niger River as far as Lokoja where the headquarters of the Royal Niger Company was located. It was therefore easy for political control to be established over the entire area.

Activities of European missionaries also aided the colonization of the Niger territories. This is because some of the missionaries, who found their way into the hinterland areas such as the Delta, Calabar, and other coastal towns, helped the British authorities to establish missions and trade posts which were later annexed. While propagating Christianity, the missionaries also initiated the process of acculturation by promoting education, health, and welfare systems among the local communities. It was, therefore, relatively easy to convince some of the natives to abandon their "inferior" cultures and value systems and adopt the "superior" Western values. It must, however, be noted that European education given to the natives was restricted to teaching elementary mathematics, English language to ease communication with the Europeans, as well as those things that will enable the natives to serve the colonial economy.

Diplomacy and military power were the other strategies employed by the colonialists. Where diplomacy fails, military power was used to subject the states under colonial authority. This was the case with Lagos in 1861. Also, the destruction and looting of Nembe (1895) and Benin (1897) and others attested to the use of military power by the British. Consequently by 1900 majority of the territories in the southern region of Nigeria had been annexed by the British. By the same 1900, the northern region which was held by the Royal Niger Company was brought under the British authority and renamed as the Northern Protectorate after terminating the charter of the Royal Niger Company. The stage thus seem set for the eventual occupation and control of Nigeria.

## British Administration in Nigeria and Reactions Towards It

Following the revocation of charter of the Royal Niger Company in 1900, the British appointed Frederick Lugard as governor-general of the Niger territories. Upon his appointment, Lugard set in motion the British colonial administrative structure. As claimed by Lugard himself, the dual mandate of the British in Nigeria and the rest of Africa is to open up Africa to the civilized world and, at the same time, open up African mind to civilization. However, what occurred in reality was beyond a civilizing mission by the British. In addition, Lugard had the mandate to conquer the remaining territories in the north that were not yet under the colonial office. With the help of the Royal West African Frontier Force (RWAFF) formed in 1900, Lugard was able to launch

successful military expeditions on Kano and Sokoto. In the resultant battle in 1903, the then Sultan of Sokoto Alhaji Attahiru fled, while the century-long empire was brought under the British.

It is important to stress that the substance of colonial administration in Nigeria is largely informed by the objectives which the colonialists sought to achieve. Apart from the claim of being on a civilizing mission, colonialism in Nigeria was tailored towards exploiting economic resources of the colony and ensuring political domination before and after independence. A major policy of the colonial government in Nigeria to boost administrative efficiency and boost trade of the colonialists was the construction of a rail line in 1896 to link Lagos and Ibadan. This was extended to Minna in 1911, and by 1914, the entire country has been covered by rail lines. Other administrative decisions of the colonial government include the 1914 amalgamation of the Niger territories. That is, the protectorate of northern Nigeria was amalgamated with the colony and protectorate of southern Nigeria and renamed "Nigeria" carved out from "Niger Area," the introduction of indirect rule system of administration with varying degrees of successes in the different parts of the country. The indirect rule system utilized already existing traditional native authority in the administration of the local people for the benefit of the colonialists. By this system, the day-to-day government and administration of areas both small and large was left in the hands of traditional rulers. However, the system succeeded in the northern part because there was an already developed system of administration and tax collection there. It was partially successful in the Western part of the country because although there were developed and powerful political authority that could serve the purpose of indirect rule, only few had taxing powers and, as such, their authority to levy taxes on the people was challenged by some. In the eastern region, there were no traditional tools comparable to what the northern and southern regions already had. Thus, the British unilaterally appointed Warrant Chiefs to function in the place of traditional rulers. Unfortunately, those appointed were not acceptable to the people. Consequently, indirect rule in the east was a total failure. Perhaps it may be reasoned that the British did not have adequate orientation of how strong the diversities of culture in the different territories are but instead assumed that the societies have the same cultural orientation, while they were more concerned with resolving the challenges of manpower shortage and truncating administrative costs.

One other area of administration under colonialism relates to Nigeria's constitutional development. The constitutional evolution of Nigeria which started in concrete terms with the Clifford's constitution of 1922 climaxed with the enactment of the 1960 Independence constitution. Between 1922 and 1960, there was the Bourdillon constitution of 1939, Richards constitution of 1946 that first regionalized Nigeria, Macpherson constitution of 1951, Oliver Lyttleton constitution which formally introduced federalism into the country in 1954, and the Robertson (independence) constitution of 1959. Worthy of note is that each constitution was an improvement on the earlier one, much as it is the product of continuous agitations for improvement by Nigerians. Second is that each constitution was usually named after the governor-general that promulgates it. Equally, the era of each constitution was characterized by problems bordering on making an acceptable and legitimate constitution for the country because the generality of the people was barely involved in processes leading to drafting of the constitutions. This justifies the view that during the colonial period, constitutions that were put in place were geared towards consolidating British imperial strategies as such; they were not people oriented (Aghalino 2006).

All through colonial administration, there were resistances form the natives first to effective occupation and, second, to perceived injustices from the British colonialist. First, Africa's coastal rulers naturally resisted all encroachments on their territory and battled to maintain the status quo. It was thus a conflict situation between the colonialists and the African chiefs. The gallant resistance put forward by leaders such as King Kosoko of Lagos and King Jaja of Opobo readily comes to mind. However, the superior fire power of the

colonialists put an end to these resistances. Second, the persistent resistance of various injustices practiced by the colonialists was also rejected by nationalists acting under different banners. These include the educated elites, the railway workers, and journalists, among others. Efforts in this regard include a series of strikes and demonstrations that were organized to press home their demand. From the railway workers' strike to Aba Women's Riots of 1929 organized to protest against levying taxes on women and series of demands by the educated elites for increased participation in their own governance which manifested in the introduction of new constitutions. It is apposite to mention that the nationalists were quick to point out anomalies that produced grievances against the colonial administration. These include economic grievances such as the displacement of emergent Nigerian capitalists in potentially profitable enterprises and the extremely high capital requirement peculiar to Nigerians; discrimination against Nigerians on the granting of bank credit facilities; and discriminatory practices in trade. Equally, while the natives had to abandon many customs and institutions such as dancing and other rituals that were held in high esteem which the colonialists described as barbaric, they accused the missionaries over their silence on such issues as discrimination, inequality, exploitation, and denial of opportunity and other evils of colonial rule. In other words, while the missionaries were busy preaching the kingdom of God, their fellow Europeans were busy preaching the Kingdom of Great Britain. Even in the area of Western education, the colonialists practice discriminatory education. For example, there was lesser quality education for Nigerians, special schools for Europeans, etc.; indeed, education in Nigeria was based strictly on learning to read, write, and calculate in English language. Later British Empire history and European geography plus a few practice subjects such as gardening, sanitation, and personal hygiene were introduced. African and/or Nigeria history was considered as either nonexistence or of no importance. These practices were a major factor in the rise of nationalism and opposition to colonial rule.

## Impact and Legacies of Colonial Administration in Nigeria

The major impact of the colonial administration in Nigeria especially at the economic realm is that it took direct control of Nigeria's economy before and after independence in 1960. Prior to independence, the colonialists, through their policies such as reorganizing the economy and the markets, determine, for instance, what type of food or commodity required by their industries back home which the natives are expected to produce. Also, the monetization of the economy made it possible for integration of the Nigerian economy into the world economy. Before colonization, the economy was based on barter system. Another dimension to this is the creation of class and class struggle. These classes include comprador bourgeoisie, petty bourgeoisie, proletariat, and the peasants. The petty bourgeoisie who later captured political power served as the apparatus through which the colonialists continued to siphoned Nigeria's resources and exploit the economy even after independence. The constant political instability, unbridled competition for state resources and state power among groups, and avalanche of economic malpractices are a reflection of nature and character of classes introduced into the country by colonialism. This trend was well captured by Galtung (1971) in his structural theory of imperialism in which he classified the world into center (developed countries of Europe) and periphery (underdeveloped or developing countries) countries. Each of the category also has a center and a periphery noting that while harmony of interests existed between the two centers, there is disharmony of interests between the peripheries. The implication of this is that the two centers collaborate to exploit resources of the periphery.

Related to the above is the emergence of what may be called "triple alliance" in the colonized territories at independence, that is, an alliance between Western capitalists, comprador elements in the colonies, and the state apparatus. The comprador elements in the colonies who inherited political power manipulate the state apparatus to favor the Western capitalist elements. Thus, as

long as there is cordiality between the capitalists and the comprador elements, access to state power in the third world is guaranteed and vice versa. The series of political instability in Nigeria can be explained within this matrix of relationship.

At the social realm, there was subjugation of the local people's culture by a foreign power. By subjugating the territories by force of military strength and state-engineered manipulation, many Nigerian societies were uprooted. It affected the psychology of the conquered people in that they began to view themselves as inferior to the invaders. Indeed, colonialism legalized the master-slave mentality that was practiced during the Trans-Atlantic Slave Trade. It is no longer news that colonialism generally and indeed colonial administration in Nigeria left the people to be culturally disoriented. Certain cultural practices of the people such as the masquerade system and divinity were demeaned and classified as barbaric and paganism. On the contrary, Western values and cultures brought and spread by the Christian missionaries were touted as the best alternative. Thus, many Nigerian societies were compelled to abandon their traditional practices and embrace the Western culture and religion. This situation persists till today. Perhaps a more fundamental issue created by colonialism in Nigeria is the fusion of many disparate entities into one Nigeria. At the level of ethnic groups (estimated to be between 250 and over 400), they were incorporated into a single national entity, thereby making inter-group relations to be difficult long after independence. Similar to this is that these ethnic groups have different religious practices. Thus, postcolonial Nigeria have been characterized by ethnic and religious competition for supremacy and for resources by these groups.

The isolationist policies pursued in the administration of the northern territories have been widely blamed for the disunity in the country (Akinwunmi 2004) and militating against efforts at attaining nationhood in Nigeria. The kind of colonial administration in the north was quite different from what operates in other parts of the country because the British authorities wanted to protect the Muslim north from the influences of the Christian south (Osaghae 1998) and also preferred to maintain the status quo in the north with the belief that it benefited the indirect rule system. The result was that the northern region lagged behind in terms of development and education. Even the attempt by the British to mitigate the damage by allocating half of the federal legislative seats to the region only exacerbated the hatred and suspicion among the ethnic groups. A familiar observer of Nigerian government and politics will discover that there has always been a race for ascendancy between the two regions which has continued till date. This is a reflection of lack of unity and mutual suspicion between the two groups, the seed of which was sown by the pattern of colonial administration.

A lasting legacy of colonial administration in Nigeria which has existed till date is the adoption of the federal system for the country. Although there are divergencies in the literature on how the system is perceived, one common thread that runs through the various postulations on federalism is that it is principally aimed at addressing governmental problems bothering on the twin but difficult task of maintaining unity while at the same time preserving diversity. Wheare's (1967) definition is often cited, and he conceived of it as a governmental system in which power is shared between a central government and a number of component units. Other scholars such as Osaghae (2016), Law (2013), Suberu (2001), Jinadu (1994), and Oyovbaire (1985), among others, radiate along this line.

An attempt at having a federation in Nigeria was in 1946 under the Richards constitution with the institutionalization of regionalism in the country. Although it was not a federal system per se as at then, the constitution of the regions was attached as a schedule to the federal constitution. Federalism in Nigeria was formally established in 1954 with the Oliver Lyttleton constitution, which granted substantial autonomy to the regions in some matters including establishment of regional civil service and judicial system. Prior to these periods, the country was administered as a unitary setup, though with some level of power devolution. Subsequently from three regions in 1954, Nigeria grew to a four-region federation in 1963 with the creation of a mid-western state. By 1967,

it was further balkanized into a 12-state structure by the General Gowon administration, and in 1976, the number of states increased to 19 with over 500 local governments. 1989 witnessed increase in the number of states to 21, 30 states by 1991, and by 1996, it has become a 36-state structured federation with 774 local governments. With this continuous structural division of the country, it may be likened to a biological cell capable of subdividing and reproducing its own kind (Dent 1993).

There is an agreement on the historical factors that made the adoption of federalism compelling such as diversities in nationalities, religion, culture, and resources. However, perceptions differ on the political forces that propelled the historical factors in crystallizing into a federal solution. The various submissions can, however, be narrowed down into two basic schools of thought. The first school which can be described as the internalist school located the political forces that propelled the historical factors into federalism in the nationalist leaders. According to this school, the realities of the country's historical past coupled with perceived economic advantage accruable from federalism as well as geographical and other political factors made federalism attractive to the nationalist leaders before independence. More so, there was growing suspicion and fear of domination by the various groups in the country. For this reason, it is appropriate to have a system of government that will grant units considerable freedom and autonomy in the internal governance of their people. This desire was found fulfilled in federalism since it is inherently decentralized and deconcentrated. The emphasis here is that Nigeria's nationalist leaders have long before independence become convinced and reached the conclusion that the country could only survive on the basis of a federal system as a means of allaying fears of political and economic domination among the various groups as well as ensuring their right of self-determination. The British was thus merely rubber-stamping what Nigerians themselves desired.

The second school of thought (externalist school) on the other hand saw the adoption of federalism in Nigeria as externally motivated. Federalism is here seen as a British imposition meant to serve the political interest of the British alone especially in terms of administrative convenience of the colonial state apparatus. The argument of this school is that, even before 1954 when federalism formally evolved, the country had been a conglomeration of different subcultures administered unitarily; to have later introduced the federal system therefore is nothing but a reflection of the self-interest of the British. It is the belief of some scholars that, contrary to the widely shared notion of achieving unity in diversity, federalism was introduced as a divide-and-rule strategy and to this extent was an abominable, disruptive, and divisive British heritage. Another perspective from this school saw federalism as a divide-and-rule strategy for decolonization; a strategy proposed to truncate the cost of colonial administration; and a strategy to stem internal divisive tendencies as obtained in Nigeria or that the system was imposed on the country in order to maintain a neocolonial state apparatus for effective control of the country after independence.

From a synthesis of submissions by the two schools of thought discussed, one may conclude that certain objective factors made federalism desirable if the country is to remain united; hence, one can hardly query the foresight of the nationalist leaders who out of the desire for self-rule plus shared rule opted for the federal solution. Similarly, the British overlords could not have pretended not to know that it was the most appropriate for a heterogeneous society like Nigeria, though other considerations may follow. Added to this is that the British would not have imposed federalism in the country if circumstances had dictated otherwise. In other words, adoption of federalism in Nigeria is neither an exclusive action of the British nor that of the nationalist leaders alone, but rather, it was a mutual but tacit desire of the two parties as it provided a common ground for centralizers and provincialists (Watts 2000).

## Conclusion

The entry examined colonial administration in Nigeria. In doing this, the trajectory of

colonialism was traced including what can be considered as taxonomies of colonial rule in general and in the country. It was realized that the objectives of colonialism which go beyond civilizing mission to include economic and political objectives determined the pattern of administration which the colonialists adopted. It is also realized that there are local comprador elements that were amenable to colonial interests. These local compradors remained in existence till date and serve as conduit for neocolonialism. It is concluded that colonial administration in Nigeria had a fluctuating fortune since it was not totally accepted to majority of the people. Continued agitation by nationalists led to improvement in the styles of administration as reflected in the series of constitution changes, and lastly, some of the legacies of colonial administration such as the federal practice are still in existent till date.

## Definition

The control or governing influence of a nation over a dependent country, territory, or people.

## Introduction

The English-speaking islands in the Caribbean, often referred to as the Commonwealth Caribbean, are the islands that once constituted the Caribbean portion of the British Empire. These islands include the islands of Jamaica, the Windward Islands (Dominica, Saint Lucia, Saint Vincent, and the Grenadines), Barbados, the Leeward Islands (comprising Antigua and Barbuda, Saint Kitts and Nevis, the British Virgin Islands, Anguilla, and Montserrat), and the so-called Northern Islands (the Bahamas, the Cayman Islands, and the Turks and Caicos Islands).

All the islands in the English-speaking Caribbean were once colonized by the British or later ceded to the British. The following is a timeline of British rule in some of these colonies:

- Anguilla was first settled by the British in 1650. The island was later under French rule in 1666 but was eventually, under the Treaty of Breda, returned to British hands.
- Antigua and Barbuda – As part of the Treaty of Breda, France formally ends its claim of Antigua in 1667 giving control to the British. In 1685 the plantation owner Christopher Codrington, a sugar planter from Barbados, leases the island of Barbuda from the British crown.
- The Bahamas was settled in 1670 when King Charles II granted the islands to the Earl of Craven. The Earl had rights of trading, tax, appointing governors, and administering the country.
- Barbados – In 1625 British sailors first arrived in Barbados. From 1627 to 1628 until its independence in 1966, Barbados had uninterrupted British control. It is referred to as "little Britain."
- Cayman Islands – The islands were captured and then ceded to England in 1670 under the Treaty of Madrid.
- Jamaica – Jamaica was captured and then ceded to England in 1670 under the Treaty of Madrid.
- Montserrat was first controlled by the British in 1632.
- Saint Kitts and Nevis – Saint Kitts was partitioned between the British and French but was restored to Britain in 1697.
- Saint Lucia – In 1664, Thomas Warner (son of the governor of Saint Kitts) claimed Saint Lucia for England.
- Trinidad and Tobago, after a number of years of rule under differing administrators, became a Crown Colony of Britain in 1802 until 1956.

In the case of all these islands, the dominant institutions, rules, and procedures that were established as the colonies attained independence were the legacy of the British. It should be recalled that the institutions, rules, and procedures in all the British colonies were tested and tried in Britain, applied in other territories, and then modified and introduced in the Caribbean. Indeed, the Public Service Commission, for example, was established in Britain in 1851 and then subsequently introduced in the Gold Coast, Africa. Later this modified version was introduced in many of the British territories.

## Understanding Colonial Administration

To appreciate the nature of colonial administration, it is important to understand the context in which the colonies developed. That context implied a colonial relationship that involved the superordination of the colonial power and the subordination of the colony. According to Greaves (1920),

> The State was to maintain law and order at home and sufficient armed forces- which were to say mainly naval forces- to prevent invasion and defend commerce. The enforcement of contracts freely arrived at between citizens and the protection of private property were its main, if not its sole duties.

The colonial state, or the administrative state in these colonies, at that period could be described then as a minimalist state. The models or arrangements that were applied in all the English-speaking colonies, not merely the English-speaking Caribbean colonies, were to a large extent a replication, at first, of the model that was employed in Britain. However, it should be recalled that all models were fashioned according to specific objectives, namely, purpose, function, clientele, or geography.

Essentially, the objective of the first three governmental arrangements that were introduced in the territories during the 1800s to the early 1900s was designed to promote "good government" or in other words stable government which as writers such as Moore (1993) and Leftwich (1993) suggest was a model that was concerned with legitimacy, accountability, and the remits of power. Later, however, these models were modified. For instance Ann Spackman (1975), the old "representative system" (in the latter half of the 1800s) and then the modified representative or "half-crown" and later the "Crown Colony" systems of administration that were introduced in the British West Indies were modified to allow for the differences between the colonies. Such differences included the size of the colonies, the differences in the educational status of the population, the size of the population, and the

composition of the population of these colonies. By the 1960s many of the colonies were granted independent status.

One of the first governmental arrangements introduced by Britain in all her colonies was the old "representative" system of government. This comprised of three major organs and established the foundation of the Westminster Whitehall model of government which was introduced when the colonies attained independence from British rule. The three organs or arms were the governor, the council, and the assembly. The governor directly represented the Crown or the proprietor. By virtue of his commission and the letters patent constituting his office, he was entitled to the obedience, aid, and assistance of all military and civil officers. The governor exercised enormous powers including the power to convene, prorogue, or dissolve the legislature and to veto any law. The governor was also responsible for the appointment of officials within the particular colony including judges and justices of the peace. He had industrial, commercial, and ecclesiastical authority. He had the authority, in the name of the Crown, to issue writs for the election of representative assemblies and councils and of convoking, proroguing, and dissolving legislative bodies. He had the power to appoint, suspend, and dismiss public officers, and also he was empowered to administer the appointed oaths to all persons in office.

The second major arm or "organ" under the old representative system of government in the case of British colonies was the executive council. This council was established by letters patent. The composition of the council included the governor, who chaired this council, and nine members. However, the number of members comprising the executive council varied from colony to colony. In essence the executive council, the forerunner of the modern-day "cabinet," consisted of senior civil servants as well as few elected members. The main responsibilities of this council were to offer advice to the governor on the management of the colony. The governor, too, was required by his instructions to consult the council in all matters of importance, except in a matter of extreme urgency when he had to make the decision based on his understanding of the problem. However, unless a clause was provided in any particular case by law or by the instructions which established the position of the governor, the governor could have acted in opposition to the advice given by the council. If this occurred, he was required to report the reasons for his action to the secretary of state. Members of the council could be dismissed only by the Crown, but in a case of urgency, a member or members could be suspended by the governor. It should be noted, though, that the council did not act as a check or balance to the governor since this was the responsibility of the assembly.

The representative assembly was nominated by the Crown, and nomination was based on the following criterion:

- The person was of the male sex.
- He was entitled to be and was registered as a voter.
- He was able to read and write English.
- He possessed in his own right one or more of the following qualifications:

  (i) Real estate of the value at least 2500 pounds above all charges and encumbrances affecting the same or from which he derived a clear annual income of not less than 200 pounds.
  (ii) A clear annual income of over 400 pounds arising from any source.

Three points are noteworthy from the requirements necessary to be nominated by the assembly. The first was that only male citizens were considered for nomination. Secondly, property was a major consideration, thus eliminating the newly emancipated slaves. Thirdly, other groups who were not in command of the English language were also eliminated from those who were eligible for nomination. It was therefore not surprising as Wrong (1923) had earlier pointed out that the assembly represented primarily the interest of the planting and former slave owning interest.

Lutchman (1970) observed that at the early phase of its establishment, the assembly was envisaged as a body with limited roles and

functions. Its powers were to be restricted to specific control over taxation, and this organ was not to have jurisdiction over administrative matters within the colony. The assembly, however, used its power of taxation to prevent the purchasing of supplies and goods within the colony. In other words, the assembly used their power to ensure that their interests would be realized. These powers soon extended into the appointment of officials to critical positions. It was evident that these three organs or arms of administration did not operate smoothly. Wrong (1923) had this to say about the operations of the administrative apparatus:

> In all the islands, large and small, the machinery of government groaned and grates and deadlock succeeded deadlock. It was only the absolute necessity of temporary reconciliations caused by the continual recurrence of danger from foreign wars and domestic uprisings of slaves and by the havoc of earthquake and hurricanes that made it all move.

The deadlock that often resulted between the governor and the council and the assembly was understandably one of the critical factors in the deliberations to reform this model of administration. Crown Colony Administration, which was later introduced, offered what later became known as the bicameral system of government. Under Crown Colony Administration, there was an executive council, which consisted of the governor and his advisers and a legislature comprising the governor, three ex officio members (the colonial secretary, the treasurer, and the attorney general), four nominated members, and seven elected members.

The governor was entrusted with the responsibility to make laws for the peace, order, and good government by and with the advice and consent of the legislature. All the recommendations proposed by the governor were to be agreed on and determined by the majority of votes in the legislative council. Under this arrangement the governor was not accorded an original vote, but in the event that there was a deadlock, he was to have the casting vote. When a bill was passed by the legislature, it was accordingly presented to the governor for his assent on behalf of the Crown. In the event though that the council refused to pass the bill, the governor could have, on his discretion, allowed this bill or motion or resolution be passed and assented to.

## Conclusion

By 1938–1939, as the dissent within the British colonies grew, the Crown established a commission to investigate the concerns within the various colonies. The Royal Commission on the West Indies (later referred to as the Moyne Commission after the chairman Lord Moyne) reported on and was largely influential for the introduction of the Colonial Development Act in 1940. Eventually, a system of self-government was introduced in the 1950s within all the British colonies.

# Colonial Legacy in Development Administration

Frank L. K. Ohemeng
Department of Political Science, Concordia University, Montreal, QC, Canada

## Synonyms

Bequest; Devise; Expansionism; Foundation; Imperialism; Nationalism; Neocolonialism

## Definitions

Colonial legacy consists of the long-standing influences and outcomes of colonialism on all aspects of the state's life for former colonial countries.

Colonial legacy refers to the continuous influence of colonial institutions in formerly colonized nations.

Development administration is about the "instrumentalities whereby the poor nations of Asia, Africa, the Middle East and Latin America were to attain standards of living similar to those of the West" (Raphaeli 1967: 3–6).

Development administration is seen as "the deliberate or artificially induced acceleration (predominantly, by public authorities) of growth processes, national goals, modernization and action programmes, with attention to normative prescriptions and value judgements concerning the direction of change" (Caiden 1969: 10).

## Introduction

Colonialism, according to Huque (1997), has had enduring consequences for formerly colonized populations (15). To Huque, countries that were once under colonial domination continue to "experience a distinctly different way of developing, maturing, and eventually arriving at a state where the legacy of dependence continues to affect their existence and performance" (15). The nature of colonialism's legacies is a topic of argument, though, with some scholars viewing its impact on development as negative; others think differently (Acemoglu et al. 2001; Dwivide 1997; Lange 2004; Mamdani 1996; Nunn 2007). Acemoglu et al. (2001) have commented on the impact on development of institutions. Similarly, Burke (1969) has explained how the "rigidity of inherited colonial bureaucratic institutions" has continued to undermine the performance of the administrative state in Africa. Nkomo (1986), again, has noted that "the administrative system as those bequeathed to Anglophone Africa are not appropriate for development purpose. They inhibit initiative, flexibility, creativity, and commitment to developmental goals (ergo, perpetuate dependency and underdevelopment) and they exacerbate inequality" (337). Local governance, a modern-day obsession is no exception, either. Kooperman and Rosenberg (1977), for example, have noted that "the highly centralised and aloof patterns of administration established by the colonial regimes contributed not only to an ineffective local government but to role behaviours characterised by authoritarianisms, which has impeded responsive administration."

It is not only in the administrative sphere that many feel colonialism had a significant negative impact; in the economic and social spheres, as well. For instance, a number of scholars have argued that European colonizers, wherever they found themselves, were not interested in developing their colonies but, rather, saw them as "economic assets to be exploited mainly for the benefit of the metropolitan power" (Booth 2007a: 1).

There are dissenters from the idea that colonialism's legacy for colonies has been negative (Booth 2007a; Moradi 2008). While Lange et al. (2006) acknowledge some negative consequences of colonialism, they maintain that in general, and especially in the case of British colonialism, the impacts were positive. Moradi (2008) has dismissed the negative impact of colonial rule thesis by arguing that both Ghana and Kenya, for example, enjoyed significant benefits under British rule. He wrote that "evidence of human development in Ghana and Kenya contradicts the existing type of colonial legacy arguments" (1118). According to him, what explains underdevelopments in former colonies cannot be simply equated to insensitivity of the colonizers to development, but is rather a matter of policies implemented by post-independent governments. He noted that "in contrast to explanations proposed by the colonial legacy literature strain, most of these factors can be influenced by [*post-colonial*] policy. Studying the experience of Ghana and Kenya can ultimately put a strong emphasis on the effectiveness of policies and generate insights into questions of the sustainability of development" (1119).

Yet other scholars hold that the appearance of a despotic and authoritarian ruler after

independence, as has so often occurred, cannot be considered an aspect of the colonial legacy (Young 1994). Booth (2007b) has noted this as well. Commenting on what happened in the colonized countries in East and South East Asia, she wrote:

> In any comparative study of economic development, it is unwise to be too seduced by the attractions of historical determinism. If economies are to grow at a sustained rate over decades and if the expanded output is to be used to improve living standards for the great majority of the population, then it is essential that a political leadership emerge that gives economic growth high priority in policy making. Such leaders did emerge in Japan in the 1950s and in most parts of East and Southeast Asia over the last four decades of the twentieth century. They gave high priority to rapid economic growth as a means of catching up with the more advanced economies and produced the growth miracle that received so much attention in the literature on Asian economic development until 1997 (203-4).

These scholars agree that regardless of the legacy, if any, of colonialism, by the early 1990s it had vanished (Grier 1999; Young 1994). Thus, according to Maseland (2018), since gaining independence countries in Africa, for example, have "followed an institutional and economic development path that is determined less and less by their colonial origins and more by their own characteristics and contemporary environment" (284).

These two schools of thought continue to dominate the discussion on colonialism and its impact on former colonies. One thing this debate, however, makes clear is the abundance of evidence that colonialism survived and affected the formerly colonized nations in the post-independence period in many ways. The legacies in question continue to manifest themselves in the social, cultural, economic, and political arenas, for instance. They continue to influence current affairs, especially in developing countries. For example, Britain still has significant influence on its former colonies in Africa and elsewhere. Similarly, the French and Spanish influences are still felt in mostly French Africa and Latin America. In all of these cases, the question we are attempting to answer is: what has the colonial legacy been in development administration?

The intention of this entry is not to determine which school of thought is winning the debate, but rather to discuss the impact of the legacies of colonialism on development administration – an idea that resonated so strongly when the colonies gained independence. Consequently, the objective is to look at the establishment and the capacity of the efficient and effective bureaucratic apparatus that would have promoted the desired development in these former colonies.

## Colonial Legacy and the Idea of Development Administration

Development administration did not become part of the public administration and management lexicon until after the Second World War (Gant 2006); precisely, in 1955, when, according to Dwivedi and Nef (1976), an Indian scholar named Goswami used it to describe a group of nations later to be known as the Third World (62). Then a number of American scholars, under the banner of the Comparative Public Administration Group, adopted it to study newly independent states in Africa, Asia, and Latin America (Loveman 2006) as a "way to distinguish the focus of administration on the support and management of development as distinguished from the administration of law and order" (Gant 2006), the latter being what traditional institutions used to be, especially under indirect rule during colonialism.

The concept was used to refer to the "instrumentalities whereby the poor nations of Asia, Africa, the Middle East and Latin America were to attain standards of living similar to those of the West" (Raphaeli 1967: 3–6 in Dwivedi and Nef 1976). In short, the idea was used to denote "those aspects of public administration and those changes in public administration, which are needed to carry out policies, projects, and programs to improve social and economic conditions" (Gant 2006). Loveman (2006) says that the CAPG saw development administration as "not only a government's efforts to carry out programs designed to reshape its physical, human, and cultural environment, but also to the struggle

to enlarge a government's capacity to engage in such programs" (291). In other words, the CAG regarded big government as the beneficent instrument of an expanding economy and increasingly just society (Esman 1988).

Fred Riggs (1965), one of the early apostles of development administration, has delineated the concept in two interrelated ways. First, he says, it refers to the "administration of development programs, to the methods used by large-scale organisations, notably governments, to implement policies and plans designed to meet their developmental objectives." Second, "by implication, rather than directly, [it] involves the strengthening of administrative capabilities." What these definitions tell us is that one cannot separate the administrative capacity of the state from the administration or management of public programs. Unfortunately, administrative capacity issues continue to be a bane to developing countries, despite numerous attempts to build such capacity, and the blame is partly on the kind of administration and bureaucratic institutions bequeathed to former colonies in Africa, Asia, and Latin America (Dwivedi 1997).

## Characteristics of Development Administration

What are the essential characteristics of development administration? There is no consensus on this question. It will be difficult to expatiate on the literature dealing with these characteristics; hence, we will focus on a number of them identified by Rathod (2010). We believe that they really capture what the concept is about, as they incorporate what other scholars have identified too. In his work, Rathod (2010) identified 16 ideas that constitute development administration, and they are summarized here.

The first is change-orientation, which involves the movement of a system or a structure from one point to another, instead of maintaining the status quo. From this perspective, the change is simply a strategic way of increasing the ability of an administrative system in relation to both the internal structures of the system and the external environment. The change thus involves administrators altering their attitudes, outlooks, and orientation in order to bring comprehensive socioeconomic transformation to society.

Second is result orientation, which he says concerns the need to rapidly bring about socioeconomic change within a time horizon for the benefit of society. The third characteristic deals with commitment, devotion, and dedication by administrators to bring about and accelerate development. Furthermore, he notes, administrators should not only commit to planning and implementation of the development program, but also to the entire process of transformation and modernization of society. Fourth is client or people orientation. This characteristic shows a close relationship between the public and the administration. The needs of program beneficiaries, and developing policies, programs, and actions that will meet them, are therefore paramount.

The fifth characteristic is that development administration is temporal-dimension, which he explains as consisting of time constraints. In other words, the need for essential development means that time may not be on the side of officials who want to delay policy development and implementation. As a result, all development programs must be completed within a specified time. The next characteristic is planned and coordinated efforts. This means organized efforts to carry out the development programs and projects, including the coordination of all institutions and agents in the society. The seventh is goal-oriented administration, which is about the sense of carrying out developmental activities. Eighth is management capacities. These are fundamental to development administration, and involve creating and enhancing management capacities as a means of achieving development goals.

The ninth characteristic is progressivism. Progressivism, he says, implies training and development of administrators for future endeavours. Such training requires forecasting in the light of changing technology and methods. Next is participation, meaning greater participation of the people in public affairs. Consequently, development administration is expected to create and promote conditions that will facilitate greater participation

of the people in the processes of economic and social development, and in the formulation, implementation, and evaluation of programs and projects. The eleventh factor is creativity and innovativeness, which refers to the ability and power to develop new ideas and their applications to solve programs of these ideas. Such creativity and innovation may demand the adoption of new structures, procedures, policies, plans, and programs that may help in achieving the development objectives.

The twelfth characteristic is responsiveness and accountability. Here, he notes that development-administration, unlike traditional administration, requires an administrator who is dynamic, innovative, and development conscious to perform his role in the administration for development. The administrator is then required to be responsive and accountable in the planning and administration of development activities. People-centered administration is the next one, and deals with the focus on serving the population with development programs and projects that are drawn up by the planners. The fourteenth is keeping in touch with social realities, which means knowing the realities on the ground, including grassroots situations and local problems. In this way it is expected that the administrator will be in constant touch with rapidly shifting social realities, so as to better understand the needs of the society.

The last two characteristics are overlapping and heterogeneity of forms and institutions, respectively. He says that in developing societies, there are overlapping institutional forms, as well as behavioral patterns; hence, in their mode of thinking and working, administrators must be guided by the ascriptive orientations of a traditional society. However, he conceded that the social role of the officer often overlaps his official role, and causes a lot of confusion and maladjustment, amid which the administrator must attempt to find a fine balance. Heterogeneity of forms and institutions, on the other hand, means that society is a heterogeneous mix of old and new, as well as traditional and modern elements, of which administration must be fully aware if they are to effectively address societal developmental needs.

## Challenges of Colonial Legacies in Development Administration

In this section, we will examine how colonial legacies gave rise to development administration. In short, how did colonialism facilitate the development of development administration in former colonies? Here, the focus is on institutional development, in particular the administrative state and its bureaucratic apparatus, which have affected planning and program development in these countries.

It has been well established that for former colonies in Africa, Asia, and Latin America to move from the level of development in the immediate post-independence era to a condition capable of dealing with "wicked" problems, they need effective institutions. Institution is defined broadly to include the structures and behaviors of the administrative state in these countries (North 1990). From the perspective of scholarly interest in former colonies,

> [d]evelopment administration was supposed to be based on professionally oriented, technically competent, politically and ideologically neutral bureaucratic machinery. It was to re-tool not only the foreign aid (both in the form of funds received and ideas suggested) but also to act as a main instrument for nation building by transforming the inputs received into developmental outputs. The most ostensible of these outputs was modernization-induced and predictable social change following Western prescriptions. At the same time, Development Administration was seen by some as a stabilizing force of social control vital in order to preclude Third World revolutions (Dwivedi and Henderson 1990:13–14)

But how did this play out? How did the legacy of colonialism affect development administration in building bureaucratic institutions with effective values and norms of serving the new states?

In former colonies in Africa, Asia, and Latin America, one distinguishing legacy of the colonial administration is institutional weakness: which, many continue to argue, has led to significant problems in the immediate post-independence periods, as well as in the present eras. As cogently put by Gant (2006),

> Administration in newly independent countries was sadly wanting in its capacity to meet these demands of independence. Bureaucracies, faced with new, staggering, and unfamiliar tasks they were not set up to perform, were further weakened by the overly rapid replacement of experienced expatriate personnel with inexperienced recruits and by inexperienced and often inept leadership. In almost every such country the immediate consequence of independence was the lessening of administrative efficiency and bureaucratic effectiveness. Administration for development was required to evolve from that point (260).

These weaknesses emerged in most instances through colonial policy dealing with how to govern these countries, which was for not developmental, but extractive, purposes – for the benefit of the colonizers. For example, in Africa the administrative systems that were established were meant to serve and protect the interests of colonial powers, not those of the colonies. As a result, the Imperial governments, through the administrative apparatus of the colonial states, were concerned with such functions as the maintenance of law and order, the collection of taxes, and the provision of limited services, such as a few schools and roads, mainly to facilitate the exploitation and retard the development of the colonies (Ankomah 1970: 141).

The colonizers thus left these countries unprepared for handling their developmental needs, which were vast, to the post-independence administrations. Development administration, therefore, became the instrument for modernizing these former colonies. Unfortunately, the earlier development administration scholars seem to have underestimated the magnitude of the problems facing these former colonies, leading to differences in opinion as to how development should be undertaken in the former colonies; and, therefore, to deadlock in what should be perceived as development administration (Schaffer 1969). The fundamental problem was that development administration continued to be a Western developed tool: especially, an American tool to achieve their aid program, which was harming their foreign policy objectives through their lack of colonial administrative experience (Hirschmann 1981: 460). It is therefore not surprising that the perspective of Western-oriented development was wholly adopted, rather than adapted, in these colonies. Development administration's success as a tool for development was thus less than had been anticipated (Esman 1991), resulting in what has become known as development management in recent times (Burke 1969).

Hirschmann (1981) has delineated four fundamental reasons development administration failed to transform development in former colonies, and they are worth repeating. First, he identified development administration as an American dominated adventure, which is to say that the thinking about the nature of development and how to achieve it was predominantly from an American perspective. As a result of this American-centered thinking, every "post-colonial bureaucrat was usually overwhelmed or left out or left behind by both the recommendations and the concepts" (461). Second, he believes that development administration became so preoccupied with reforming the administrative states of former colonies that it led to "self-questioning and doubt, once it became clear that few of its proposals were being seriously attempted and still fewer were succeeding" (461); leading in turn to what he sees as the unmooring of the vision of development administration scholars from reality: what they thought and "what was actually occurring were two very different things" (461). Development administration inevitably lost some of its relevance, Hirschmann says.

The third problem that in Hirschmann's view affected development administration was that scholarly

> [i]nterest was not in any minor reform, but in substantial changes of structure and practice. Government departments which saw themselves as struggling to maintain their position as viable entities providing a reasonable standard of service, were somehow expected to initiate and sustain large-scale structural and procedural innovations. What the bureaucrat saw as problems, the academic interpreted as challenges. If the Movement's attention to reform made it appear less than relevant, then its prescription for (and optimism about) large-scale dramatic change made it appear less than realistic (461).

Development administration opened a chasm between theoreticians and practitioners in former

colonies. How to do even necessary reforms became controversial and unresolvable by the two entirely differently oriented parties.

According to Hirschmann, the fourth problem of development administration, which can be linked to the previous factors, is the "conflicting views on technical assistance for public administration . . ." (462) in developing countries. He noted that this issue arose as a result of the recurring failures and negative responses by recipients, which left the role of this type of technical assistance seriously questionable (462). Again, the problem was one of different visions of development. The American oriented thinking of the development administration scholars was regarded with suspicion by candidate countries' political leaders and bureaucrats; would what they were proposing really benefit them? Failure to reconcile led to a search for new ways of developing these former colonies, and to shedding development administration (De-Guzman 1979; Luke 1986; Khator 1998).

## Conclusion

Development in former colonies in Africa, Latin America, and some Asian countries continues to be problematic. The colonial legacy, deeply ingrained in the political, economic, social, and administrative spheres, is part of the problem. It has made reforming these societies extremely difficult, despite their many years of independence.

Scholarly attention has focused on developing administrative capacity through technical assistance, an approach that became known as development administration, and which was formulated by American scholars interested in understanding these countries. The impetus of their interest derived from the American government's technical assistance program to help them. Unfortunately, while development administration became a household term for examining, explaining, and developing techniques that would help these countries, by the 1970s its influence had waned. Many then questioned its wisdom.

Development administration could not achieve what it set out to do mainly because its proponents underestimated both the magnitude of the colonial legacy and the limitations of their own American political, administrative, social, and economic perspectives. Development administration's aims from the viewpoint of many in these former colonies was really just a new form of "colonialism" or neo-colonialism. It could not do much in the context of conflict with the ideas of indigenous governments. While proponents of development administration had good intentions, their failure to understand inherent problems of development, and to adapt to the developmental needs of these countries, doomed their noble objectives to remain only theoretical.

# Combining the Contingent Valuation Method with Citizen Advisory Committees

Philippe Bance[1] and Angélique Chassy[2]
[1]CREAM (Centre de Recherche en Économie Appliquée à la Mondialisation/Research Centre for Economics Applied to Globalisation), Normandie Université, UNIROUEN, Rouen, France
[2]Normandie Université, UNIROUEN, CREAM, Rouen, France

## Synonyms

Contingent valuation method: monetary valuation; Citizen advisory committees: citizen consultation, participation, participatory democracy, involvement

## Definitions

Contingent valuation method: economic technique of valuation for nonmarket resources, which wishes to measure utility of public goods or programs and found public decisions upon consumers' revealed preferences

Citizen advisory committees: groups of persons built to be representative of citizens concerned by certain public policy and contribute to their elaboration and implementation by their

active participation in evaluating public-making processes

## Introduction

The contingent valuation method (CVM) is a tool widely used in standard public economic calculation that seeks to ground public decisions on whether or not to produce public goods in social preferences apprehended through individuals' declared preferences (The CVM was developed at the instigation of the US federal government as part of national environmental policy, and more particularly within the Environment Protection Agency.). To that end, it uses questionnaires sent to representative individuals in order to assess, on the basis of hypothetical scenarios (hence the "contingent" nature of the method), their willingness to pay as the beneficiaries of public action (The argument could also be couched in terms of willingness to accept in the case of the losers in public action.). The method falls within the scope of cost-benefit analysis and monetizes the net benefits of the production of such and such public good or program of public action in order that policymakers can decide between various public expenditure options. The method aims not only to make public action more efficient but also to legitimize it as a fitting response to the expectations of the population. For this reason, CVM has become an object of infatuation, with several thousands of contingent studies having been carried out throughout the world in recent decades (Flachaire and Hollard 2005). However, the results of these contingent studies have attracted strong criticism, particularly with regard to methodology. Diamond and Hausman (1993) note that the main problem with the method is that the individuals questioned do not provide correct information because they are not generally expecting to answer the questionnaires and their hypothetical scenarios. Hausman (2012) also notes that a contingent valuation does not provide a solid basis for assisting with policy development, to which Carson (2012) replies that the debates seeking only to criticize the method must be stopped and efforts made instead to improve it.

However, the problems with the CVM are even greater in a context of multilevel public governance that is in a system in which several levels of government act jointly in order to initiate expenditure and to allocate public goods; decisions in such a system are not taken by a central actor but rather by a multiplicity of public actors who have to act in concert in order to evaluate and decide on the programs to be implemented. Moreover, those involved in public action today face an increasingly demanding population.

However, CVM's conceptual framework is centralist, since it is based on the implicit assumption that a single public decision-maker is operative in the contingent studies. Nor does it take into account the need to involve citizens very closely in public decision-making (Bance and Chassy 2018). Consequently, the purpose is to analyze the impact of the establishment of citizens' representative bodies, so-called citizen advisory committees (CACs), with extended rights of participation in an evaluative and decision-making process carried out using the CVM. This analysis is conducted by explaining in greater detail the limitations of the CVM, particularly in a multilevel governance regime, in order then to describe the opportunities the CACs offer.

## CVM's Analytical Framework and Public Decision-Making in a Multilevel Regime

The purpose of the CVM is to determine the social utility of public programs or goods on the basis of individuals' expressed preferences. Public decision-makers obtain the information that is supposed to indicate to them the course of action to be adopted from surveys carried out among representative samples of the population and the administration of questionnaires. To that end, they investigate the monetary value that the interviewees impute to the public goods about which they have been questioned on the basis of hypothetical scenarios. This involves asking a representative sample of individuals a hypothetical question: how much would you be willing to pay *ex ante* for a given modification (preservation and/or improvement) to a public good? The aim

is to determine the social value of public goods. By aggregating each individual's willingness to pay, a "shadow price" is obtained for the good in question. These monetized benefits are then compared with the costs incurred by the program under consideration in order to decide whether or not to put it into practice. If there is a "social surplus," the program is socially desirable and useful. Conversely, a "social deficit" will cause the program to be turned down.

This comparison of the various programs also enables public decision-makers to choose between possible courses of action (to hierarchize, by selecting and eliminating programs) in the light of existing financial constraints.

In this traditional concept of the CVM, a single central authority is the sole optimizer of social well-being. It ignores the institutional context within which public action now usually takes place and which is characterized by the existence and demands of a multiplicity of actors involved in public decision-making. Account has to be taken, after all, of the profound changes in institutional architecture, such as those that have taken place in Europe with the establishment of multilevel governance systems in which different levels of government (local, national, and supranational) operate in concert with each other. This being the case, public action is a product of the shared prerogatives that lead these various levels of government to make joint decisions and thus to agree on the programs to be implemented. However, these considerations do not reduce the public authorities' use of the CVM. After all, certain public decision-makers, particularly at the subnational level, feel a growing need to appropriate this economic valuation tool in order to strengthen the foundations on which evaluations of their programs for the production of public goods rest by introducing a greater degree of expertise into the process. Consequently, they seek to appropriate the CVM in order to take informed decisions on the basis of contingent surveys. Thus multilevel governance regimes make it necessary to take into account two additional conditions that have to be fulfilled if CVM is to be an effective decision-making aid. The first is that all public decision-makers should be involved in developing the hypothetical scenarios and are therefore able to give their own perspective on the nature of the public goods to be produced and on the issues at stake in the decision-making process. The second condition is that the scenarios should provide relevant information that enables each of them to make decisions with full knowledge of the facts.

It should be added that the declared objective of multilevel governance is to take the best possible account of the interests of the populations in the regions by providing the authorities with competences situated at the appropriate level in order to enable them to specify and implement public action effectively (Bance 2016).

It was for this reason that this governance regime was established within the EU, together with the notion of subsidiarity, which was introduced by the Maastricht Treaty (1992) (The treaty signed on 7 February 1992 in Maastricht is the founding treaty of the European Union) and then enshrined in the Lisbon Treaty (2009) (The treaty signed on 13 December 2007 in Lisbon governs the functioning of the European Union. It entered into force on 1 December 2009) as the Union's fundamental principle. Subsidiarity is a principle that holds that decisions should be taken as close as possible to the citizen – as long as public action can be carried out effectively at that level. Thus, the Charter for Multilevel Governance in Europe (European Union – European Committee of the Regions 2014) states that "multilevel governance [. . .] helps us to learn from each other, experiment with innovative policy solutions, share best practices and further develop participatory democracy" (p. 3). Achieving these declared objectives, just like the growing demands from ordinary people to have their voices heard more clearly by political decision-makers, tends drastically to change the conditions under which public action is carried out and evaluated. While the public authorities (particularly at national level) seek to retain their rights to control a sufficiently broad swathe of public programs, they have lost the power to impose their choices unilaterally and have to accommodate their other public partners. This has led them to act in concert and in a coordinated way with the other levels of government and in particular in the present case with a

supranational authority. Moreover, the decentralization that has been set in motion in various countries has led the central state to delegate or share some of its competences with regional authorities. Granting greater autonomy to public authorities at subnational level has been one way of involving citizens to a greater extent in public decision-making. However, the entanglement of the various levels of competence and responsibility that results from multilevel governance is also a source of tensions and conflicts, which can be analyzed as the interplay of actors in a context of "coopetition", i.e., one characterized by both cooperation and competition (This concept, which is derived from corporate strategy, was first mooted by Ray Noorda, the founder of the Novell company, and then popularized by Brandenburger and Nalebuff (1996).). The rivalry plays out between the higher and lower levels of authority as they seek to defend their own *desiderata*. The need to dispel these conflicts and tensions makes it all the more necessary for the actors concerned to engage in continuous dialogue and for civil society to be heavily involved, not simply in order to jointly construct programs of public action but also to adapt them by trying to match them as closely as possible with citizens' preferences.

This in turn calls into question a process like the CVM which, as we are going to explain, gives the public authorities greater room for manoeuver without any real participation on the part of citizens.

## The Tenuousness of Citizens' Place and Role Distorts the Traditional CVM Framework

Although its declared aim is to ground public action in the preferences of the individuals concerned, citizens are not really involved in the CVM's various stages of implementation, whether it be *ex ante*, *in itinere*, or *ex post*:

(a) During the *ex ante* phase of the valuation, the population in question is not generally consulted except by means of pre-surveys conducted within a framework pre-established by the authorities. Thus, there is very little consultation of the populations concerned while the questionnaires are being put together. These are generally constructed in such a way as to fulfill the expectations of public decision-makers who wish to define the modalities and contents of the programs and, in particular, to ascertain whether or not a program should be adopted on the basis of the hypothetical scenarios presented to citizens.

Consequently, insufficient attention is paid to citizens' ability to understand the scenarios:

(b) The valuation by citizens takes place in the second operational stage (*in itinere*). The individuals concerned (at least those who take part in the survey) are invited to take part in the valuation by filling in the questionnaire and to state, through their willingness to pay, the utility they impute to the program under consideration.
(c) The third, *ex post* operational stage is that in which the final decision is taken. On the basis of the responses to the questionnaires and hence of the effects (overall benefit or deficit after aggregation of the individual benefits and subtraction of the costs), the authorities decide on the social utility of various programs. In this way, they assess whether or not they are justified in view of the population's expectations and rank them in order.

The scant presence of citizens in this process and the total absence of any discussion with representatives of civil society clearly indicate that the traditional framework within which the CVM is implemented suffers from some serious deficiencies, particularly in multilevel regimes. This gives rise to two major problems.

The first is a lack of relevance in the construction of the hypothetical scenarios and hence in the survey results. The scenarios may well prove to be inappropriate and difficult for interviewees to understand.

Not everyone enjoys the social conditions that will help them understand what is being asked of them. People tend to find it difficult to assess a program's utility if they are not directly affected by it. Those interviewees who are representative of the individuals least well endowed with social capital are very likely not to appropriate the surveys for themselves and even to be uninterested in them; as a result, they may give up answering the questionnaire or do so inappropriately (Bourdieu 1973). In so doing, they are short-changing the social categories they represent, which is likely to cause the final decisions taken by the public authorities on that basis to be rejected out of hand. As Mignauw (2016) explains, "the dispute may concern not the end purpose of a project but rather its design, content and modes of implementation" (p. 208). Such an occurrence severely undermines people's trust in decision-makers and constitutes a serious setback in terms of the social acceptance of public policies.

The second major problem is the failure to adapt to the public authorities' evaluation needs within a decision-making framework in which the points of view of a multiplicity of actors representing the public authorities and civil society more generally have to be taken into account. The decision-makers "furthest removed from the people" are those who have by far the greatest technical expertise in using the CVM. This often leads national and supranational decision-makers to consider themselves omniscient and to exercise a *droit de seigneur*, which gives the population another reason to reject their decisions. The CVM does, after all, weaken one of the major comparative advantages that local decision-makers enjoy, namely, their knowledge of the local population's personal preferences, acquired by virtue of their proximity to the people. Thus, local decision-makers may see it as an obstacle to exercise of their prerogatives and a factor in strengthening the ability of the authorities furthest removed from the people to dominate the interactions between the actors by imposing their own strategy in the decision-making process. As a field survey found (Chassy 2014), this is one of the main reasons why local decision-makers refuse to appropriate the CVM and to debate with other decision-makers within that framework. The other reasons for local decision-makers' rejection of the method lie in their perception that it calls into question the principle of equal treatment for all citizens and people's incomprehension of the decisions taken within that framework.

Thus, the CVM has to be redesigned in order to make it less technicist. This could be achieved by turning it into a method for assisting public decision-making in such a way that it becomes part of a collective learning process. This could make it truly socially acceptable and transform it into a decision-making aid to be used in conjunction with other methods by which citizens can evaluate social utility. Citizen advisory committees may fulfill these requirements.

## The Characteristic Features of Citizen Advisory Committees

CACs are citizens' group setup to represent the community and take a position in the process of developing and implementing public policies. Their existence rests on an ethical principle, namely, citizens' representation as a means of matching public decisions with social aspirations. A number of local experiments serve to illustrate this: in Canada in the so-called correctional service (Correctional Service Canada "Working together," Citizen Advisory Committees in Correctional Service Canada, Website: http://www.csc-scc.gc.ca/cac/092/dep-fra.pdf), in Belgium within the Union des Villes et Communes de Wallonie/ Union of Cities and Municipalities of the Walloon Region (CCC- Union des Villes et Communes de Wallonie, website: https://uvcw.be/articles/1,354,1,0,3824.htm) or as an integral part of the Code of Local Democracy and Decentralization (CDLD – art.L 1122–35), and in France in the *communes* of Wasselonne (CCC- Ville de Wasselonne, website: https://www.wasselonne.fr/Votre-mairie/Conseil-Consultatif-Citoyen.html) and Digne les Bains (CCC- Ville de Digne les Bains, website: https://www.dignelesbains.fr/coordonnees-et-horaires-de-la-mairie/democratie-participative/). Over and above certain individual cases that sometimes have a restrictive effect on

citizens' prerogatives, it will be assumed in what follows that the fundamental purpose of CACs is to establish a close link between civil society and public decision-makers with a view to jointly managing public action. By observing and analyzing public action and offering advice and making recommendations to the authorities that have a real influence on public decision-making, they work to have citizens' needs and interests taken into account in the development and implementation of public programs and the production of public goods.

From this ethical perspective, CACs must be representative of the populations affected by certain public actions; they must be suitably constituted, their members must be known and their presence accompanied by fruitful exchanges. However, they must be much more than mere mouthpieces; they must be able to have a significant effect on decision-making processes in order to generate real value added. The public authorities have to accept that these committees sometimes pose a fundamental challenge to the decisions they would have taken alone.

This is a basic condition for the social acceptance of public action conducted over the long term by the public authorities, even though they might be legitimate representatives of the population after a democratic election. Permanent interaction or even confrontation between people's perceptions of their needs and political decision-makers' views of what those needs are is, after all, essential for the proper implementation of public action; this is particularly true in situations in which decisions taken by politicians are disputed, sometimes fiercely.

From this point of view, the contributions of CACs are greater than those of other established bodies, such as citizen juries and workshops, which are also supposed to represent civil society and make public action more acceptable. After all, the purpose of these latter bodies is to gather informed opinions as part of a process of exchanging information and arguments.

It is not the job of citizens' juries, which became established from the 1970s onward in Germany and the USA in particular, to redefine public policies. In Germany, their main task has been to manage the so-called participatory budgets made available for urban renewal or to put forward informed opinions on the management of city districts, as in Berlin. In the USA, citizens' juries have mainly taken up socio-technological issues, particularly in the fields of telecommunications and nanotechnologies, in order to deliberate over them and compare points of view. As for workshops, introduced in Denmark in 1992, these are mainly working group setup to resolve particular political problems. They are made up of public decision-makers, experts, and informed citizens; several political scenarios are put to them "in order to help them develop a shared vision around a project" (Fondation Sciences Citoyennes n.d., p. 1).

## CACs' Ability to Involve Themselves in the Various Stages of the CVM Valuation Process

The value of CACs is that they make the CVM valuation process part of a joint approach to the construction of public action. Representative groups of citizens can find themselves involved continuously in that construction process, from the design phase to the final decision. As far as implementation of the CVM is concerned, this means that CACs are involved in the three stages of the valuation process leading to a final decision: *ex ante, in itinere*, *and ex post*.

(a) *Ex ante*, that is to say during the phase in which hypothetical scenarios that provide the basis for evaluating the relevance of a program or the production of public goods are specified, CACs provide the public authorities with more detailed or previously missing information on citizens' preferences. What these citizens' groups bring to the table in this phase is, after all, their knowledge of existing public action programs.

They are also bodies able to scrutinize these programs; on the basis of collegial discussions, they can gauge the need to renew or modify them. They are also able to recommend new ones. Such well-substantiated

recommendations serve then to clarify which of the programs are to be chosen to undergo contingent valuation for the public authorities. In multilevel governance regimes, they constitute a solid, well-substantiated basis for the various levels of government to decide on the programs that most deserve to undergo contingent valuation. After this specification by the public authorities of the programs that are to undergo contingent valuation (accompanied by an explanation by the public authorities of the reasons why the views expressed upstream were considered or dismissed, in accordance with an ideal type reflecting best practices in transparency and trust building), CACs can be called on to analyze the hypothetical scenarios in the contingent valuation questionnaires. Their collective expertise brought to bear on the questionnaires compiled by experts in contingent valuation will help to improve them. The aim here is to ensure that the scenarios are relevant to citizens' needs, that they reflect their social aspirations, and that the vocabulary used is completely comprehensible and does not offend their sensibilities. It is also essential to avoid any obstacles caused by poor comprehension by using the CACs as test groups in order to make any improvements that may be needed in order to render questionnaires compiled by experts in contingent valuation fully comprehensible to ordinary citizens; to be avoided, therefore, are "technical expressions and particular turns of phrases that have to have been learnt and which, consequently, outsiders and lay persons are unlikely to know" (Porzig 1962, p. 219). Thus, the aim of this exercise is to prevent the CVM questioning from "generating meaningless answers" (Terreaux and Brahic 2009, p. 132). For this reason, a good understanding of the questionnaires and scenarios gives the survey greater credibility by remedying two of the method's three main methodological biases, which undermine the credibility of the results. The first bias is the difficulty individuals have in projecting themselves into a hypothetical scenario. Ami and Chanel (2009) explain that this difficulty stems from a "lack of experience of and information about the good undergoing valuation" (p. 49). The second bias follows from the first: non-responses due to a lack of comprehension or interest on respondents' part and which often leads them to reply: "I don't know, I don't understand," or "I don't want to reply." The result is to make the information gathered significantly less accurate, which reduces the validity of the valuation. The experts on the so-called NOAA panel (National Oceanic and Atmospheric Administration) (1993), whose studies of the CVM are authoritative, noted in their report that the reliability of the results is seriously undermined if non-response rates are high.

(b) During the *in itinere* phase which, in the traditional CVM framework, is that in which citizens are consulted through the administration of the questionnaires, CAC involvement is probably less crucial. Nevertheless, it has the advantage of enabling citizens to monitor the process in order to make sure that the survey is being conducted satisfactorily and is well understood. This monitoring is such that it can prevent the CVM's third well-known bias, the so-called interviewer bias that also undermines the validity of the results. Anxious to demonstrate their "social desirability," interviewers often tend to present themselves in a favorable light to their interviewees. The latter's lack of information about the public good being evaluated further reinforces interviewers' power to influence. In order to counter this problem, CACs are able to intervene during the administration of the questionnaire by consulting interviewees in order to ensure that they understand the survey and that there is no interviewer bias; at a later stage, the CACs could possibly invalidate a survey if there have been significant problems with the administration of the survey and, if necessary, suggest that the questionnaire and the hypothetical scenarios be amended in order that a new, valid valuation can be carried out.

(c) In the final, *ex post* phase of the valuation process, in which programs are adopted or rejected in the light of the survey results, citizens' involvement is particularly crucial as part of an exercise in participatory democracy. The aim here is to reach final decisions that take due account of citizens' preferences while at the same time, in a context in which it falls to the authorities to take the decision, maintaining a capacity for collective interpretation of the opportunities for implementing the public action. CAC involvement in this phase is all the more beneficial since the results of the contingent valuations are often difficult for public decision-makers to interpret, particularly in multilevel regimes. Decision-makers react in different ways to the results depending on their political sensibilities, their areas of expertise, and their regional positioning. In this regard, Bance and Chassy (2017) have pointed out that decision-makers run significant risks (particularly in terms of their reelection) if they take a final decision solely on the basis of the results of the CVM questionnaires. Some decision-makers may also find an opportunity in the results obtained to assert their own interests over those of their partners. There is very real potential for disagreement in the joint decision-making process. In this situation, CACs can be useful mediators. They can advise decision-makers on the potential political repercussions of the measures taken and on the current state of the programs after evaluation. Citizens can, after all, be versatile and take up new positions when programs are endorsed.

Sheatsley and Hyman (1953) note in this regard that "the acts of human beings are not determined solely by their opinions but also by powerful factors specific to each situation" (p. 508). Thus, media coverage of the projects and the alternatives opened up by the adoption of programs can change opinions at the end of the valuation process. The feedback CACs provide for decision-makers can give rise to debates among decision-makers as to the value and purpose of public action and may lead them to update and revise the points of view that emerged from the contingent valuation. Although political decision-makers "ultimately retain their power" (Prémont and Boisvert 2003, p. 27), CACs play a role that is all the more useful since there is a multiplicity of "leaders" and it is often necessary to negotiate a compromise between the positions held by the various levels of government. The participatory approach makes it possible to explain iteratively the strengths and weaknesses of each point of view with evidence from detailed discussions with representatives of civil society in order to initiate changes on the basis of shared results.

## Conclusion

This chapter has underlined the considerable limitations of the traditional CVM specification that is used to evaluate and adopt public action programs, particularly in multilevel governance regimes. It has shown that, implemented in conjunction with CACs, the CVM is, nevertheless, able to supply information which, on the basis of a cost-benefit analysis, can help to guide public decision-makers and enable them, by adopting a deliberative approach, to improve the joint valuation and decision-making procedures leading to the production of public goods. Thus, these procedures gain from the introduction of participatory democracy, which improves the validity of the survey results, reduces the biases in the CVM identified in the literature, and helps to position citizens within a decision-making process that otherwise suffers from a profound lack of dialogue and consultation. These important contributions made by CACs as part of an evaluative process of the CVM type do not reduce the need for additional research aimed at resolving the difficulties encountered in organizing the CAC-CVM combination efficiently at all stages of the valuation and decision-making process. How can CACs be made truly representative of the population and how can this be combined with genuine participation that meets citizens' expectations over the long term? And how can we ensure that CACs are not

instrumentalized by political decision-makers, who thereby deprive them of any real power to influence the final decision-making?

Citizen communication; Communication elements; Communication influence; Communication

mechanisms; Communication strategy; Development communication; Ethical communication conduct; Government communication; Political communication; Strategic communication

## Introduction: Understanding the Role of Communication

It is well known that communication plays a critical role in achieving governance outcomes, but an explanation of how it works and why it works has not received as much attention (IBRD/World Bank 2009). In exploring this dearth of understanding about how communication works in securing governance objectives, analysts have identified source, message, audience, and contextual factors as influencing positive change. In an attempt to identify and elaborate on the role of communication, efforts have been made to link "reform objectives; communication influence mechanisms; opinion, attitude and behaviour change; and good governance outcomes" (IBRD/World Bank 2009, p. 1).

## Definition

Reform objectives are the target behaviors designed to help the government and its governance structure and agencies and citizens relate to each other to bring about change. Communication influence mechanisms are those aspects of communication which exert some influence over governance. They include persuasion, lobbying, reporting, public consultation, negotiating, access to information, central and local government communication, media influence and framing of issues, and the use of Information and Communication Technology (ICT) and social media. Opinion, attitude, and behavior change are reflected in the building, enabling, and sustaining of political will, organizational will, and public will. Such political will changes are evident in the coalitions and consensus building among political leaders and elites. Changes in organizational will are reflected in the bureaucracies and efforts of middle management in the public sector. Changes in public will are displayed in the activism and participation of civil society groups and institutions. Good governance outcomes are based on the strategic objectives and principles of standards of appropriate conduct between a government or an organization and those citizens and stakeholders over whom they have authority or power. The opinion, attitude, and behaviour change are influenced by the success and sustainability of reform objectives and the mechanisms for communication.

## Defining Governance and Communication

Governance concerns principles for regulating the relationship between governments and their citizens. This relationship is guided by the former's obligations and the latter's rights and obligations. It incorporates state capability, state responsiveness and accountability to civil society, and other stakeholders (IBRD/World Bank 2009). Such communication is also referred to as development communication. Development communication is "defined as citizen engagement underpinned by access to high quality information" about the actions of policy makers which facilitates activism, evaluation, and monitoring, and public debate which holds the government accountable and fosters two-way communication (DCERN/Gamos 2008; ICD/Gamos 2016).

It refers also to the style or manner associated with the exercise of authority and power by the state or an organization. It involves the actions and processes which are developed to create stability and assurance in the system of governance. It is defined in this way as being

> not just about government. It is also about political parties, parliament, the judiciary, the media, and civil society. It is about how citizens, leaders and public institutions relate to each other in order to make change happen.
>
> Good governance requires three things:
>
> *State capability*—the extent to which leaders and government are able to get things done;

> *Responsiveness*—whether public policies and institutions respond to the needs of citizens and uphold their rights;
>
> *Accountability*—the ability of citizens, civil society and the private sector to scrutinize public institutions and governments and hold them to account. This includes, ultimately, the opportunity to change leaders by democratic means. (DfID 2006, p. 20)

This three-pronged approach to the requirements of good governance

> implies that it is the state's mandate to get things done and be responsive to citizens' needs. In development parlance, this is **the supply side of governance**. Accountability, on the other hand, implies the right, but also the obligation on the part of citizens' groups, civil society, and private firms to remain vigilant, engaged, and demand better service provision and delivery from their leaders. This we call **the demand side of governance**. (IBRD/World Bank 2009, p. 2)

## Strategic Communication for Good Governance

A communication strategy designed to facilitate good governance is usually planned, organized, implemented, and updated (UNDP n.d.). Accordingly, a basic communication strategy should have clear goals, target audiences, messages adapted to various target audiences, transmission channels, and an understanding of the receiver of the message.

The strategy is usually informed by a mapping of producers and users of governance indicators. Such a mapping can include an overview of users and nonusers of such data, the purposes of using such data and reasons for not using them. If there is low awareness or a mismatch between the available governance data and policy requirements, for example, then the communication strategy could be to increase the level of awareness. In Trinidad and Tobago, for example, but this may apply in varying degrees to other Caribbean territories (Caribbean 2016), a communication strategy for governance may include developing reform objectives, communication influence mechanisms and opinion, attitude and behavior changes to support the drafting of legislation for devolution of power from central to local government.

Some areas for developing strategic communication include planning and agenda setting (Ministry of Planning and the Economy 2011b), draft policies (for example ICT in education; GoRTT 2005), projects to increase public awareness and participation based on key indicators and developmental pillars and sustainable development goals SDGs (UNDP 2015a, b), government communication, public consultations, and access to information (GISL 2016; GorTT 2016). In other English-speaking Caribbean states, communication strategies may be based on assessments of ICT support for governance (Dunn and Minto-Coy 2011), Internet governance (Morris 2013), public sector reform country positions (Riley and Nunes 2004), and opportunities for training (UWIDEC 2007) and conferences advancing knowledge of the role of the media and governance (Media and Governance in Latin America 2014, 2015).

These are some suggested stages in the development of a communication strategy (UNDP n.d.):

1. A preliminary outline is prepared by the governance assessment secretariat and its nearest partners.
2. The outline is submitted to various stakeholders and partners for comments. Partners can be consulted individually, in a technical meeting, or in a stakeholder meeting to build consensus and seek buy-in.
3. At some point, the communication strategy should be reviewed by communication experts.
4. Once the strategy is ready, it will be important to share with partners and groups that you aim to reach. This will facilitate developing the various tools intended to reach different target audiences.

A minimum set of questions that should be asked includes:

1. What assessments results need to be made known?
2. What social groups and actors will be interested in this knowledge?
3. What are the needs of these varied groups and actors? What components of the governance assessment are most interesting to them?

4. What communication tools would be most appropriate to use for these target groups?
5. What is the timeframe?
6. What financial and human resources are available?
7. Who will be in charge of implementing the communication strategy?

## Global Governance

Global governance has emerged since the Cold War as coordination, cooperation, and problem-solving of transnational issues go beyond territorial boundaries. The handling of these issues requires resources beyond those of individual states (Weiss 2008). Global governance requires "the concerted efforts of political actors around the world" (Adolphsen 2014, p. 18) to manage issues such as environmental pollution, human rights, drug-trafficking, and terrorism. Climate change is an example of such a global issue that affects individual Caribbean territories in different ways and which may prompt different and contentious responses to setting a global agenda and communication about it. Another example is a global response to health issues such as the threat of Ebola, Zika, and emerging infectious diseases and the convergence of communicable and non-communicable diseases (NCDs) that places demands on limited resources available in public health.

## Global Governance and Communication Models

One of the ways in which communication system precursors supported governance was through public service broadcasting (PSB). For this reason Michalis (2010) explains, Western European countries regarded PSB as a public service, rather than a competitive industry, that could serve the state's extensive role in the socioeconomic life of the state and of its citizens. However, as Trappel (2010) contends, the experience in small states like Austria and Switzerland provided limited media governance options for public service media (PSM) in light of external influences. The Caribbean experience, in light of the potential influence of colonial powers in Europe on the development of its PSB and PSM models, should be considered from a postcolonial and post-independence perspective to ascertain whether there were similarities and differences between that influence and the more established traditions in smaller states elsewhere.

## Governance in the English-Speaking Caribbean

The postcolonial English-speaking Caribbean experience is largely based on constitutional provisions for regulating the relationship between government and its governance institutions, and its citizens to ensure accountability, transparency, and reporting and civil society participation. Emerging from the colonial legacy and struggles for true independence, sovereignty, and self-government movements, small Caribbean states grapple with challenges of leading plural, divided and fractured post-colonial societies encountering the effects of mainly one-way globalization, in changing and demanding political, economic, and social climates. The existing models are being reformed in line with shifts in governance models and the evolution of best practices.

## Governance Model(s) in the English-Speaking Caribbean

Governance models have enjoyed a developmental policy shift from one-way to two-way participatory forms of communication. Communication for development (C4D) is concerned with the reorientation of a diffusion-only model of development transmitting governance models from North to South to incorporate an appropriate contextual model "as a way to amplify voice, facilitate meaningful participation, and foster social change" (Haider et al. 2011, p. 8) to reduce social disparities and inequities and promote Global South governance.

## Communication and Governance Best Practices

Best practices designed to understand, develop, and support the critical roles of communication in communication are set out in a number of funded projects (UNDP n.d.; IBRD/World Bank 2007, 2009; Gamos 2008). They set out principles of conduct for ethical, accountable, capacity-building, responsive, and strategic communication. Strategic communication includes activities and stages, and messages, channels, and media to understand, build, and sustain governance reform. It includes setting reform objectives, using communication influence mechanisms to bring about attitude, opinion, and behaviour change, and using and adapting guidelines for assessing and evaluating communication for public administration and governance.

## Politics and Governance in Trinidad and Tobago

### Governance Structure

The governance structure in Trinidad and Tobago incorporates but goes beyond government to include governance institutions. According to Commonwealth Governance (2016a), these governance institutions include: Elections and Boundaries Commission (www.ebctt.com); Parliament (www.ttparliament.org); Judiciary (www.ttlawcourts.org); Ombudsman (www.ombudsman.gov.tt); Integrity Commission of Trinidad and Tobago (www.integritycommission.org.tt); Ministry of Planning and Sustainable Development (pesrga.gov.tt) or Planning and Development (http://www.planning.gov.tt/); Office of the Prime Minister (www.opm.gov.tt); Ministry of Legal Affairs (www.legalaffairs.gov.tt); Ministry of Local Government (www.localgov.gov.tt); Ministry of Finance and the Economy (www.finance.gov.tt); Ministry of Trade, Industry and Investment (www.tradeind.gov.tt); Central Bank of Trinidad and Tobago (www.central-bank.org.tt); Trinidad and Tobago Stock Exchange (www.stockex.co.tt); Trinidad and Tobago Bureau of Standards (www.ttbs.org.tt); Telecommunications Authority of Trinidad and Tobago (www.tatt.org.tt); Regulated Industries Commission (www.ric.org.tt). Other nontraditional and emergent forms exist in the work of civil society groups, nongovernmental organizations (NGOs), citizen-based organizations (CBOs) and faith-based organizations (FBOs).

Prime Minister Dr. Keith Rowley affirms Trinidad and Tobago's commitment to being "deeply rooted in the values of democracy and good governance which form the basis of the Commonwealth's core principles" and observes that the unitary state "works assiduously to ensure that the foundation of good governance laid out by the Harare Declaration of 1991 is built upon in all facets of our political and judicial system" (Rowley 2016).

Trinidad and Tobago is described as

> a unitary republic with a representative government and a degree of regional autonomy. The Head of State is a non-executive President elected by an electoral college comprising all the members of parliament. The executive is led by the Prime Minister who heads a cabinet chosen by him or her and responsible to parliament.

(Commonwealth Governance 2016b)

Trinidad and Tobago has a legislature consisting of

> a bicameral Parliament, with a directly elected 41-member House of Representatives and a 31-member Senate. Senators are appointed by the President, 16 on the advice of the Prime Minister, six on the advice of the leader of the opposition, and nine of the President's own choice. Elections are held every 5 years.

(Commonwealth Governance 2016b)

Tobago is represented in the governance structure. It has

> a regional house of assembly, set up in 1980, with certain local powers over finances and other delegated responsibilities. It has 12 elected members and several members appointed by the political parties. Constitutional amendments have granted Tobago greater control over urban and rural development, health, education and housing, though its assembly has no legislative powers.

(Commonwealth Governance 2016b)

## Governance and Communication in Trinidad and Tobago

Trinidad and Tobago is described as having a population of 1.3 million, a poverty rate of 16.7, a literacy rate of 98.75, and a Human Development Index of 59 (UNDP 2015a). The UNDP's 17 sustainable development goals (SDG) for 2030 are linked to the Strategic Plan focus on sustainable development, democratic governance and peace-building, and climate and disaster resilience. Goals 1 – eradication of poverty, 10 – reduced inequalities, and 16 – on governance were identified as being central to the UNDP's current and long-term plans (UNDP 2015a).

Good governance was identified as one of seven pillars of interconnected development for Trinidad and Tobago at a UNDP workshop in 2011 presented under the theme of prosperity for all (Ministry of Planning and the Economy 2011b). The other pillars were people, poverty eradication and social justice, security, IT connectivity, diversified knowledge economy, and foreign policy. The highest ranking concerns in descending order based on recent polls (2011) were crime/law and order/vandalism 93%, inflation, especially food prices 34%, health/hospitals 34%, unemployment/ jobs 32%, poverty/inequality 16%, low pay/wages 16%, economy 13%, housing 12%, roads 11%, and education/schools 9% (Ministry of Planning and the Economy 2011b). The medium term plans emphasized four pillars and the top five concerns, (i.e., all except the pillars of good governance, IT connectivity and foreign policy, and the lower-ranked public perception concerns of housing, roads, and education/schools) (Ministry of Planning and the Economy. GoRTT 2011a).

Good governance "focuses on ensuring transparency, accountability participation and effective representation through institutional strengthening, enhancing democracy and strengthening execution and delivery capacity" (Ministry of Planning and the Economy 2011b). This meant five major policy shifts including two which appeared to be governance related, "Greater citizen participation and more meaningful local government" and "More responsible and responsive Government with greater emphasis on transparency and accountability." Thus, although recognized among the seven interconnected pillars of national development and mentioned in a summary of policy shifts, governance was not included in the medium term development plans of the administration (2010–2015).

Commenting on governance in Trinidad and Tobago, Spence (2012) referred to an anomaly, and to the T&T constitution to illustrate that "Within recent years the demarcation between the responsibilities of ministers and permanent secretaries has become blurred." He referred to the anomaly of government ministers visiting locations to address problems which should be under the purview of the permanent secretaries. According to the Constitution, Spence adds, Cabinet has "general control and direction over the government of Trinidad and Tobago and shall therefore be accountable to Parliament" (Sec 75: 01) and where any minister "has been assigned to any department of government. He shall exercise general direction and control over that department; and, subject to such direction and control the department shall be under the supervision of a permanent secretary whose office shall be a public office." This perceived blurring may well be related to matters of government communication in an era of emerging governance reform objectives and a desire for the government to be seen as responding to the needs of citizens.

To increase governance and foster public participation and representation, the UNDP embarked on a series of projects aimed "at improving participation in the democratic process, especially among under-represented or marginalized groups; improving the accountability of democratic institutions to the people who they represent; and a general fostering of the universally accepted principles of democratic governance, namely anti-corruption, women's

empowerment, equal opportunities, and human rights." As an example the UNDP reported on a "project undertaken to improve the local government system in Trinidad and Tobago, aimed at empowering local communities and encouraging local economic development. This project involved drafting new legislation and developing a decentralized system, that devolves to local communities, authority that was previously vested within the central government" (UNDP 2015b, 2016). This remains a work in progress.

## Government as Communicator

In the postindependence era, the role and mandate of government as communicator has evolved from various manifestations of the Government Broadcasting Unit (GBU) to the contemporary Government Information Services Limited (GISL). The GISL's structure and function have been under review during a period of national consultation and re-visioning.

The GISL offers media services using IT, social media, radio and television, and publication of an online and archived gazette to support public administration, governance, and development. GISL's website features main menu banner tabs for its Home, About Us, Media Services, Government, Publications ($n = 22$; e.g., tourism, energy, the nation's 50th anniversary, government's record in office, budget statements, proportional representation, agriculture, finance and investment, civil service transformation), News, GISL Corporate, and Contact Us and side links to the News Channel 4. It also documents the most recent postcabinet briefing by video, news.gov.tt, E-Gazette, and a calendar of events, TT Gazette archives, and links to the Office of the President, the Office of the Prime Minister, and ttconnect. There are Facebook and Twitter links. The media services include news feeds and online access to press releases, advisories, speeches, high resolution images, audio clips, and video clips.

## Corporate Governance

Corporate governance communication is an important aspect of the governance climate. This aspect of communication and governance is charged with monitoring, developing, and disseminating corporate governance principles. The UNDP (2012) adopted a definition of corporate social responsibility (CSR) as "the responsibility of enterprises for their impacts on society" (European Commission 2011). A UNDP report on Trinidad and Tobago, examining CSR among CEOs in 31 large businesses considered "the role of business within the framework of national development" and sought "to integrate issues of community development, environmental conservation, human rights, working, industrial relations, consumer interest and corporate governance into its definition of corporate responsibility thereby roughly reflecting the principles of the U.N. Global Compact" (UNDP 2012, p. 13).

The report noted, "Among the elements that strategic planning frameworks for CSR would traditionally entail are non-profit partnerships, sponsorships and financial donations, reporting requirements, corporate governance, community investment and employee engagement. This result does not suggest much improvement over the past few years in terms of a stronger alignment of core business processes with CSR activities" (p. 23) and concluded "The relatively weak state of CSR reporting in Trinidad and Tobago with only half of all CEOs interviewed confirming any kind of disclosure means that the corporate governance remains a significant challenge in the country's boardrooms" (p. 25). A similar finding revealed, "the overall level of disclosure remains low compared to other emerging markets" (Syntegra 2011, p. 5), and one deputy CEO observed,

> Maybe ten years ago nobody was really interested in who your directors were, what exactly their level of qualification was. Now what you find happening is that when they come to do due diligence on you, the corporate governance aspects of your business such as how is the organisation run, what kind of board you have in place, what kind of procedures you have, whether you have a code of ethics, how is it rolled out to your staff, how much ethics training do you do… all those things are now huge and organisations are being forced into doing them. In Trinidad and Tobago there is a real need to drive proper governance in both government and corporate life. But people have to connect the dots. You have to go to them and tell them why it is important. And government could be the driver behind

> bringing in the resources to do that kind of training because it is very expensive. We do corporate governance training for our board where we use an external facilitator and it's costly. But if government started through the state sector first where the companies are huge, that would change the dynamics. (UNDP 2012, p. 32)

At present there is one organization that advertizes itself as the "only non-profit professional membership organization in the Caribbean, serving Directors, Investors, and Corporate Governance stakeholders" (CCGI 2016). Corporate governance is increasingly being regarded as significant, particularly since the 2008 global financial crisis and there is considerable room for improvement. A need for better synergy between government governance and corporate governance has been observed, and better efforts to improve understanding through communication strategies are recommended.

## Civil Society

Civil society refers to "the multitude of associations around which society voluntarily organizes itself and which represent a wide range of interests and ties. These can include community-based organisations, indigenous peoples' organisations and non-government organisations" (OECD 2007). It is the "third sector," along with government and business or the market (UN 2016; BBC 2001). As noted in a BBC (2001) report, "next to the state and the market, advisors to the US Government have suggested that it is 'the ultimate third way' of governing a society." It is framed as "a public space between the state, the market and the ordinary household, in which people can debate and tackle action."

NGOS, CBOs, and FBOs contribute to good public administration and governance in the Caribbean. In Trinidad and Tobago, their main and potential contributions are in representing citizens' voices, and fostering engagement, critical dialogue, and participation, such as in consultations on the national budget, for example (Civil Society Meets Finance Minister 2010; Statement by Civil Society Organizations and Institutions 2015). These organizations are encouraged to join a Network "designed to disseminate information about social programmes and identify issues of poverty and vulnerability within communities in Trinidad and Tobago" to share information and access resources which can contribute to their communities and their members may access community services and information through the Network (Network of Civil Society Organizations 2016).

Key organizations include the Network of NGOS for the Advancement of Women who partner with government agencies such as the Ministry of Health and the Family Planning Association and government's social services and social development ministries and the Office of the Prime Minister for gender and women's affairs. According to a message on the establishment of the Civil Society Board from the Ministry of National Diversity and Social Integration in August 2014, "The Civil Society Board (CSB) is being formed to effectively communicate the opinions and views of the Civil Society" (TT NGO News 2016). Civil society expertise is well documented (Commonwealth of Nations 2016). The Federation of Independent Trade Unions and NGOs (FITUN) and the National Trade Union Center (NATUC) represent labor interests and actively monitor trade negotiations. The Inter-Religious Organization (IRO) is one prominent FBO among many. Environment TOBAGO and Friends and Fishermen of the Sea (FFOS) are notable environmental NGOs. Local NGOS, CBOs, and FBOs also partner with international NGOS such as Habitat for Humanity, the Red Cross and the Pan American Health Organization (PAHO), and the regional partner Caribbean Public Health Agency (CARPHA).

## The Press

The Press including print and broadcasting media also play a critical role in good public administration and governance in the Caribbean. In the case of Trinidad and Tobago, their main roles are in the framing and representation of conflict, accord, and dissent. The Press cover stories on elections, government and opposition policies and activities, energy, corruption and public funding and

spending, crime, and social, economic, commercial, and civil society interests (Steele 2016; Hosein 2016).

The Press serves as a watchdog in its critical role in exercising press freedom and meeting its advertised responsibility for the public interest in governance. Freedom House (2013) noted "Freedom of the press is enshrined in the constitution and is generally respected in practice. However, there were a number of cases in 2012 in which government officials intimidated critical journalists and media outlets." It remains under constant defense (Fraser 2013). In conjunction with provisions for press freedom, the passage of the Freedom of Information Act (FOIA) has been described as legislation "that can cause a revolution in our democracy, because people can actually monitor government and public authorities themselves" (Ramlogan 2006; FOIA 1999). It promises legislation to support accountability, increased participation, and equality of access to citizens.

## Summary and Conclusion

The critical role of communication in good public administration and governance is recognized. A better understanding of how communication fulfils its potential and actual roles is needed. A review of the mechanisms, influence, and strategic dimensions of communication demonstrates its pivotal role in achieving reform objectives and securing opinion, attitude, and behavior change. Good public administration and governance in the Caribbean was explored using Trinidad and Tobago as a case study. Similar in-depth work on other Caribbean territories across the complex, linguistic, cultural, social, and political communication continuum can contribute to a broad-based perspective focusing on the aspects of development communication that speak to the Caribbean as a region with governance communication needs, challenges, and possibilities that are distinct but related to Latin America and the rest of the world. The state, corporate, and civil society sectors contribute to the range of sources, messages, audience, and contextual factors of communication which can influence positive change. The active and engaged participation of the government and its institutions, the corporate sector and citizens, and the mediation of dialogue, debate, and monitoring through the traditional and newer channels of communication sponsored by the state, corporate and civil sectors, and The Press offer opportunities for defining and meeting the mutual obligations and responsibilities of good public administration and governance.

# Communication Management of COVID-19 in Nigeria

Raphael Abumchukwu Ekwunife[1], Divine Favour Robinson[1], Ikechukwu Ogeze Ukeje[2] and Kalu Ojiaku[1]

[1]Department of Mass Communication, Evangel University Akaeze, Ebonyi State, Abakaliki, Nigeria

[2]Department of Political Science, Alex Ekwueme Federal University Ndufu Alike, Ebonyi State, Abakaliki, Nigeria

## Synonyms

Communication directives; Information dissemination; Moral necessity; Severe acute respiratory syndrome; Social investment program; Viral infection

## Definitions

| | |
|---|---|
| Communication management | The systematic planning, implementing, monitoring, and revision of all the channels of communication. |
| Corona virus disease-19 | A disease caused by corona virus, leads to respiratory illness while damaging the human immune system, transmitted through droplets of an infected person into another person's eyes, nose, or mouth and highly fatal in nature. |
| Ethical imperative | A belief or principle which is perceived as extremely morally necessary. |
| Palliative | An approach that improves the quality of life of individual facing problems associated with life-threatening illness. |

| | |
|---|---|
| Social distancing | A precautionary measure of maintaining at least 1 m distance from every person in a bid to stop the spread of COVID-19. |
| Misinformation | The propagation of false or unverified information through communication channels. |
| Lockdown | A total closure of all economic, social activities to ensure people stay indoors in order to curtail the spread of COVID-19. |

## Introduction

At present, COVID-19 is probably the most popular issue featured by the media all around the world. In journalism term, it has become a "sacred cow" – a news story which every editor would allow to pass through the gate for audience consumption. Keeping in mind that misinformation travels faster than accurate information (Veles 2016; Oberiri 2016), fake news about this virus is rapidly spreading around the world. There are incomplete pieces of information, rumors, and misconceptions about COVID-19 in the public space and people are at the risk of taking actions based on misinformation (BBC 2020). There is also a cloud of uncertainty around this epidemic arousing fear and panic worldwide. On this premise, the need for ethical consideration in information and communication management that is COVID-19 related is imperative as communication devoid of ethics has a far reaching implication on the society (Nwodu 2006). The dangers of fake news about COVID-19 can also be as fatal as the disease itself, taking into cognizance the reports of deaths and hospitalized persons in Nigeria triggered by a hoax about the Ebola virus disease where gullible citizens were misinformed to drink and bathe salt water in order to prevent the spread of the virus in 2014. Today, the platforms used to share COVID-19 misinformation vary across in Nigeria. The social media with its advantage of speed, wide reach, and content sharing is more prominent. Facebook, WhatsApp, Twitter, and Instagram stand visible in this respect. In the view of Oberiri (2016), these media are characterized with the absence of editors (gatekeepers) in the news and information disseminated by citizen journalists. This has led to information overload which is a strain to many. There is absence of media literacy which is a factor that makes the practice incompetent with unethical dispositions.

Traditional media (radio and television) also play harmful roles in the spread of "the fake news virus, not giving heed to journalism ethics. There is a cross-posting across all platforms. WhatsApp and Facebook in particular, are common channels in carrying out misinformation, as they allow for the circulation of different types of media; voice notes, videos, text messages, and links to other platforms. More importantly, social media beat bureaucracy and checkpoints which dispose them as purveyors of fake news and misinformation since they bypass the gatekeeping process that makes journalism an ethical and distinct practice (Ekwunife et al. 2020b).

Social media "activists" and "influencers" use their social media platforms to spread misinformation and propagate conspiracy theories to the extent of promoting the denial of COVID-19. A voice note emerged on WhatsApp on the 23rd of March, 2020, of an alleged World Health Organization expert who claimed to have taken a unique course on COVID-19. In the audio, he predicted that at least 45 million Nigerians would die during the pandemic. The audio provoked so much attention and elicited huge traffic that the Nigeria Center for Disease Control (NCDC) issued a statement rebutting his claims. Even if the purported statement was verified, professional communicators would have a way of releasing same, if necessary to pass the information to consumers with minimal tension. That is ethics. Utilitarianism as an ethical principle would consider the impact of a piece of information on the greater number of the people (Udeze 2012; Okunna 1998). Misinformation has been

spreading throughout the continent of Africa too. It could be recalled that a Kenyan blogger on twitter and many others on social media shared a video with the caption "Kenyan couple exchanging blows with a Chinese couple in the streets of Wuhan. . .It's survival for the fittest." The fact is that the video was aimed at misinforming the public, trying to spark racial and xenophobic attacks on the Chinese. It was later discovered that the video was taken in New York and had no relation to COVID-19. In many instances, social media pick events from different scenes and superimpose them on other burning issues in order to cause tension, generate traffic, and elicit inflaming comments (Ekwunife et al. 2020c). Some sites and bloggers thrive in this unethical practice with the motive to make money since fake news sell faster (Darnton 2017).

Trust also plays a massive role in whether messages are believed. Content is more likely to resonate when it comes from religious heads, friends, family, other trusted authority figures, or power brokers. Okunna and Omenugha (2012) examine this under social-categories theory of media effect. Indeed, some significant orders play key roles on the credibility of media messages. The US president, Donald Trump's comment about the "very, very encouraging early results of chloroquine to treat corona virus" tends to be more widespread and believed than the subsequent clarification and dismissal offered by the US Food and Drug Administration. The credibility of the information was, in part, linked to the fact that it came from President Trump. In fact, health officials in Lagos reported three cases of individuals being hospitalized due to an overdose of the drug (Stephanie and Bukola 2020). Recall that governor of Cross Rivers state, Nigeria, Professor Ben Ayade reportedly noted that there is no need for social distancing as face mask alone protects persons from the virus. He explained that as a professor of science, he understands the nature of the virus and how the human body naturally fights against it; but this stance seems not ethically imperative in the management of COVID-19 as it goes in contrast with the advice given by the Nigeria Center for Disease Control and the World Health Organization on the need for all to observe social distancing as an effective way of curtailing the spread of COVID-19. Also, the governor of Kenya's capital, Nairobi, has been criticized for supposedly making misleading remarks about alcohol and the corona virus. Governor Mike Sonko had said that he was including bottles of Hennessy cognac in food supplies for vulnerable people in the city, saying it would serve as a "throat sanitizer." He added that "From the research which has been conducted by World Health Organization and various health organizations, it has been revealed that alcohol plays a very major role in killing the corona virus, or any sort of virus." This is complete misinformation which tends to misinterpret the World Health Organization's advice on the virus that drinking alcohol does not protect you against the corona virus, but it does refer to the efficacy of alcohol-based gel in washing the hands. In fact, the World Health Organization stated that alcohol consumption "is likely to increase the health risks if a person becomes infected with the virus." It is surprising to note that trusted figures and significant orders could easily be carriers of misinformation regarding COVID-19. Although educated are government officials, they may lack any background in medicine or public health which makes it very unethical for such persons to speak on such issues as authorities.

With the danger of misleading the public through misinformation about COVID-19, the entry for this study sets out to examine the absence of ethics in the communication management of COVID-19 and its attending implications in Nigeria.

## Origins

There is yet no clear history of COVID-19, hence, the origin remains debatable. There has been some sort of misinformation about the origin of COVID-19 carried by the TV Asahi Corporation of Japan, sparking rumors that the virus might have originated from the USA. The report purports that the virus was imported to Wuhan at the Military World Games held in October 2019 by the US delegates, adding that the

14,000 Americans who died of influenza might have unknowingly contracted the corona virus while the US government failed to grasp how far the virus had spread in US soil. This report sparked lots of propaganda in the Chinese cyber space.

Separating facts from speculations, the first cases were identified in Wuhan, China. In the earliest case, the patient became ill on the 1st of December 2019, and had no reported link to the Huanan seafood market (The Lancet). Official statements by the Chinese government to the World Health Organization reported that the first confirmed case had been diagnosed on the 8th of December 2019. On the 26th of December 2019, Zhang Jixian, a doctor in the Hubei provincial hospital treated and observed a pneumonia cluster of unknown cause from a patient admitted into his hospital and reported to the Wuhan Jianghan Center for Disease Control on the 27th of December 2019. On 30th of December 2019, a group of doctors at Wuhan Central Hospital alerted their colleagues of a "SARS-like corona virus" causing pneumonia, and on the 31st of December 2019, the Wuhan Municipal Health Commission released a public notice on the findings from the doctors and informed the World Health Organization.

Further test results showed on 2nd of January 2020 that 41 of the patients in Wuhan hospitals had been "laboratory-confirmed" as infected with the corona virus and two-thirds of those infected had been exposed to the Huanan Seafood Wholesale Market in Hubei province (Robert 2020), meaning that 13 patients diagnosed had no link to the Huanan Seafood Wholesale Market (The Lancet) Live animals are sold in the market and this points to the fact that COVID-19 can be traced to zoonosis – disease caused by animals. When doctors began exchanging urgent warnings notifying themselves of a new severe acute respiratory syndrome–like virus, local authorities in Wuhan detained eight of these doctors and made them to sign documents admitting wrong doing, including ophthalmologist Li Wenliang who later died of the disease. In the early stages of the spread, it was believed that the virus could only spread from animal to human and not human to human as later discovered by scientists in China, but it was too late as a lunar new year banquet held in Wuhan on the 18th of January 2020 was attended by over 130,000 persons from over 40,000 families. This large gathering in Wuhan, a transport hub and a major rail interchange further escalated the spread of the virus to other provinces in China (Chaolin 2020).

On 13th of January 2020, the Ministry of Public Health in Thailand recorded its first case imported from Wuhan, China. On 16th of January 2020, the Ministry of Health, Labor, and Welfare in Japan recorded its first case imported from Wuhan, China. On the 20th of January 2020, the first case of COVID-19 was recorded in South Korea. On 23rd of January 2020, USA and Singapore recorded first cases of COVID-19. On 24th of January 2020, Vietnam recorded its first case of COVID-19 without a travel history from China, while his family member was the one with a travel history to China. This became the first incidence of a human to human transmission of COVID-19. On the 26th of January 2020, Malaysia, France, Australia, and Nepal all recorded first cases of COVID-19. On the 27th of January 2020, Canada recorded its first case of COVID-19 while on the 28th of January 2020, Germany, Cambodia, and Sri Lanka all recorded first cases of COVID-19. On the 29th of January 2020, the United Arab Emirates recorded its first case of COVID-19 while on the 30th of January 2020, India, Philippines, and Finland all recorded first cases of COVID-19. Italy recorded its first case of COVID-19 on the 31st of January 2020. On the 1st of February 2020, Russia, Spain, Sweden, and the UK all recorded first cases of COVID-19. On the 5th of February 2020, Belgium recorded its first case of COVID-19. On the 15th of February 2020, Egypt recorded its first case of COVID-19, being the first case confirmed on African soil. On the 20th of February 2020, Iran recorded its first case of COVID-19 while on the 22nd of February 2020, Israel and Lebanon recorded first cases of COVID-19. On the 24th of February 2020, Kuwait recorded its first case of COVID-19. On the 25th of February 2020, Bahrain, Oman, Iraq, and Afghanistan all recorded first cases of

COVID-19. On the 26th of February 2020, Switzerland, Austria, Algeria, and Croatia all recorded first cases of COVID-19. On the 27th of February 2020, Brazil, Pakistan, Romania, Denmark, Norway, Greece, Estonia, Georgia, North Macedonia, and Nigeria all recorded first cases of COVID-19. On the 28th of February 2020, Netherlands, Belarus, Lithuania, and New Zealand all recorded first cases of COVID-19. On the 29th of February 2020, Mexico and San Marino recorded first cases of COVID-19. On the 1st of March 2020, Ireland, Ecuador, Qatar, Azerbaijan, and Monaco all recorded first cases of COVID-19. On the 2nd of March 2020, Indonesia, Czech, Dominican Republic, Luxembourg, Iceland, and Armenia all recorded first cases of COVID-19. On the 3rd of March 2020, Portugal, Saudi Arabia, Morocco, Tunisia, Latvia, Andorra, Senegal, and Jordan all recorded first cases of COVID-19. On the 4th of March 2020, Chile, Poland, Ukraine, Argentina, and Liechtenstein all recorded first cases of COVID-19. On the 5th of March 2020, Hungary, Bosnia and Herzegovina, Slovenia, Palestine, Gibraltar, Saint Martin, and Saint Barthelemy all recorded first cases of COVID-19. On the 6th of March, Serbia, South Africa, Cameroon, and Bhutan all recorded first cases of COVID-19. On the 7th of March 2020, Peru, Colombia, Slovakia, Togo, and the Vatican City all recorded first cases of COVID-19. On the 8th of March, Moldova, Bulgaria, Costa Rica, Malta, Faroe Islands, Martinique, French Guiana, and Maldives all recorded first cases of COVID-19. On the 9th of March 2020, Bangladesh, Albania, and Paraguay all recorded first cases of COVID-19. On the 10th of March 2020, Panama, Cyprus, Guernsey, Brunei, and Mongolia all recorded first cases of COVID-19. On the 11th of March 2020, Bolivia, Burkina Faso, Democratic Republic of Congo, and Jamaica all recorded first cases of COVID-19. On the 12th of March 2020, Turkey, Cote d'Ivoire, Honduras, and French Polynesia all recorded first cases of COVID-19. On the 13th of March 2020, Cuba, Kosovo, Reunion, Jersey, Guyana, and Saint Vincent and the Grenadines all recorded first cases of COVID-19. On the 14th of March 2020, Puerto Rico, Ghana, Guinea, Kenya, Venezuela, Gabon, Sudan, Guadeloupe, Ethiopia, Trinidad and Tobago, Cayman Islands, and Antigua and Barbuda all recorded first cases of COVID-19. On the 15th of March 2020, Kazakhstan, Mayotte, Guatemala, Congo, Equatorial Guinea, Eswatini, Namibia, Central African Republic, Caracao, and Mauritania all recorded first cases of COVID-19. On the 16th of March 2020, Uzbekistan, Uruguay, Rwanda, Saint Lucia, Seychelles, and Suriname all recorded first cases of COVID-19. On the 17th of March 2020, Somalia, Tanzania, Guam, Liberia, Aruba, Bahamas, Benin, and US Virgin Islands all recorded first cases of COVID-19. On the 18th of March 2020, Montenegro and Greenland recorded first cases of COVID-19. On the 19th of March 2020, Djibouti, Kyrgyzstan, Mauritius, Bermuda, Barbados, Zambia, Sint Maarten, Montserrat, and Gambia all recorded first cases of COVID-19. On the 20th of March 2020, Niger, El Salvador, Chad, Fiji, New Caledonia, and Nicaragua all recorded first cases of COVID-19. On the 21st of March 2020, Isle of Man, Cabo Verde, Haiti, Zimbabwe, Timor-Leste, and Papua New Guinea all recorded first cases of COVID-19. On the 22nd of March 2020, Madagascar, Uganda, Eritrea, Angola, and Syria all recorded first cases of COVID-19. On the 23rd of March 2020, Mozambique and Grenada recorded first cases of COVID-19. On the 24th of March 2020, Myanmar, Belize, Dominica, and Turks and Caicos all recorded first cases of COVID-19. On the 25th of March 2020, Libya and Laos all recorded first cases of COVID-19. On the 26th of March, Mali, Guinea-Bissau, and Saint Kitts and Nevis all recorded first cases of COVID-19. On the 27th of March 2020, British Virgin Islands and Anguilla recorded first cases of COVID-19. On the 29th of March 2020, Northern Mariana Islands recorded its first case of COVID-19. On the 1st of April 2020, Sierra Leone, Botswana, and Burundi all recorded first cases of COVID-19. On the 3rd of April 2020, Malawi recorded its first case of COVID-19. On the 4th of April 2020, Caribbean Netherlands recorded its first case of COVID-19. On the 5th of April 2020, Falkland Islands recorded its first case of COVID-19. On the 6th of April 2020, South Sudan

recorded its first case of COVID-19. On the 7th of April 2020, São Tomé and Príncipe recorded its first case of COVID-19. On the 8th of April 2020, Saint Pierre and Miquelon recorded its first case of COVID-19 and on the 11th of April 2020, Yemen recorded its first case of COVID-19 being the last country to record a first case till date.

COVID-19 which started in the city of Wuhan has gone out and spread throughout 225 countries of the world, affecting every continent of the world excluding Antarctica. On the 26th of March 2020, the USA overtook China and Italy with the highest number of confirmed cases in the world. Global COVID-19 death has now surpassed the 200,000 mark.

Below in Table 1 are statistics on the number of reported cases, recoveries, and the number of deaths recorded across the world.

## COVID-19, Nigeria Experience and Crisis Management

On the 31st of January 2020, the World Health Organization listed Nigeria among other 13 African countries identified as high risk for the spread of the virus and on the 27th of February 2020, the first case of COVID-19 was recorded in Nigeria. The carrier was an Italian citizen diagnosed in Lagos State. On the 9th of March 2020, Nigeria recorded its second case from Ogun State, a Nigerian who had close contact with the Italian citizen; who later also recovered from the disease on the 13th of March. On the 23rd of March 2020, Nigeria recorded its first death to COVID-19, a 67-year-old Suleiman Achimugu, an engineer and former managing director of Pipelines and Products Marketing Company who returned from the UK with underlying health conditions. Since then, Nigeria has gone ahead to record over 20,000 cases, with over 7000 recoveries, recording over 500 deaths. The virus has almost spread throughout the federation with Lagos State having the highest number of confirmed and active cases. Below in Table 2 are statistics representing the extent of the spread in Nigeria according to Corona Virus Pandemic in Nigeria (2020).

Nigerian government has enacted social distancing strategies and putting in place lockdown orders, encouraging personal hygiene in a bid to curtail the further spread of the virus. The Nigeria Center for Disease Control (NCDC), Nigeria's leading national public health institute, has been at the forefront of the COVID-19 pandemic, collating numbers and responding to suspected cases of the virus. Isolation centers have been put in place in Lagos, Abuja, Osun, Ebonyi, and Kano States, with more being built and some ready to be commissioned to give special treatments to COVID-19 patients across the country.

In every sphere of life in Nigeria, COVID-19 has created an atmosphere of crisis even as the World Health Organization has declared it a pandemic, with a pandemic comes crisis and so the need for crisis management. As COVID-19 is affecting economies around the world, Nigeria is struggling to adjust to this new situation and develop a strategy to prevent damages which COVID-19 poses. Damages here refer to both the safety and the productivity of the entire Nation.

Social distancing, lockdown orders, and the stay-at-home directives are all ways to curb the spread of this deadly disease which has already had a grave effect on the livelihood of most Nigerians, particularly those who live by the daily bread as commercial activities have been limited, food prices have gone so high, the economy is getting paralyzed as 96% of Nigeria's businesses, which comprise 37 million small and medium enterprises (SMEs), are all handicapped (Corona Virus Pandemic in Nigeria 2020). The decline in oil price is of great disadvantage to Nigeria as sale from petroleum is a major source of income for the country. This has prompted the revision of the Nigeria budget as the money coming in can no longer sustain the country. The senate recently approved additional N850 billion to finance the 2020 Nigeria budget. There have also been cases of police brutality in enforcing the stay-at-home directives by the Nigeria government. According to several media reports, such as Channels Television, Africa Independent Television and a host of them on social media (particularly Facebook), brutality and violence

**Communication Management of COVID-19 in Nigeria, Table 1** 2019–20 COVID-19 pandemic by country and territory as at 29th of April 2020
